The Table of Contents on this page indicates the sections covered in this manual. At the beginning of each individual section is a Table of Contents which gives the page number on which each major subject begins.

When reference is made in this manual to a brand name, number, or specific tool, an equivalent product may be used in place of the recommended item.

All information, illustrations, and specifications contained in this Manual are based on the latest product information available at the time of publication approval. The right is reserved to make changes at any time without notice.

quality parts
make a difference
even on
simple jobs.

Mr. Goodwrench wants you to have the right parts for your truck—whether you see him for service or whether you do the work yourself.

That's why Mr. Goodwrench wants to have a good stock of genuine GM Parts available. Everything from exclusive GM Goodwrench replacement engines and transmissions to GM Goodwrench Motor Oil that meets or exceeds all specifications for General Motors cars or light trucks. And Mr. Goodwrench has a complete line of GM chemicals for fine care of your GM vehicle. Plus accessories to add convenience—or just a little extra style.

So keep that great GM feeling with genuine GM parts at participating independent Mr. Goodwrench dealers selling Chevrolets, Pontiacs, Oldsmobiles, Buicks, Cadillacs, GMC and Chevy Trucks.
FOREWORD

This service manual contains diagnosis, "On-Vehicle" maintenance, and light repair for Light Duty Truck Models ("R-V, P-Truck, and G-Van"). Fuel and emissions related components for throttle body injection vehicles are covered in a separate manual. Procedures involving disassembly and assembly of major components for these vehicles are published in a separate "Truck Unit Repair Manual." Wiring diagrams for these models are also published in a separate "Truck Wiring Diagram" booklet.

This manual should be kept in a handy place for ready reference. If properly used, it will meet the needs of technicians and vehicle owners.

CAUTION:

These vehicles contain some parts dimensioned in the metric system as well as in the customary system. Some fasteners are metric and are very close in dimension to familiar customary fasteners in the inch system. It is important to note that, during any vehicle maintenance procedures, replacement fasteners must have the same measurements and strength as those removed, whether metric or customary. (Numbers on the heads of metric bolts and on surfaces of metric nuts indicate their strength. Customary bolts use radial lines for this purpose, while most customary nuts do not have strength markings.) Mis-matched or incorrect fasteners can result in vehicle damage or malfunction, or possibly personal injury. Therefore, fasteners removed from the vehicle should be saved for re-use in the same location whenever possible. Where the fasteners are not satisfactory for re-use, care should be taken to select a replacement that matches the original. For information and assistance, see your authorized dealer.

CAUTION

To reduce the chance of personal injury and/or property damage, the following instructions must be carefully observed.

Proper service and repair are important to the safety of the service technician and the safe, reliable operation of all motor vehicles. If part replacement is necessary, the part must be replaced with one of the same part number or with an equivalent part. Do not use a replacement part of lesser quality.

The service procedures recommended and described in this service manual are effective methods of performing service and repair. Some of these procedures require the use of tools specially designed for the purpose.

Accordingly, anyone who intends to use a replacement part, service procedure or tool, which is not recommended by the vehicle manufacturer, must first determine that neither his safety nor the safe operation of the vehicle will be jeopardized by the replacement part, service procedure or tool selected.

It is important to note that this manual contains various Cautions and Notices that must be carefully observed in order to reduce the risk of personal injury during service or repair, or the possibility that improper service or repair may damage the vehicle or render it unsafe. It is also important to understand that these 'Cautions' and 'Notices' are not exhaustive, because it is impossible to warn of all the possible hazardous consequences that might result from failure to follow these instructions.

SERVICE PARTS IDENTIFICATION LABEL

The Truck Service Parts Identification Label is provided on all models (figure 1). It is located on the inside of the glove box door (or on an inner body panel for Forward Control models). The Label lists the VIN (Vehicle Identification Number), wheelbase, paint information and all Production options or Special Equipment on the vehicle when it was shipped from the factory. ALWAYS REFER TO THIS INFORMATION WHEN ORDERING PARTS.

VEHICLE IDENTIFICATION NUMBER

The VIN is the legal identifier of the vehicle. On all models except Forward Control, it is located on a plate which is attached to the left top of the instrument panel and can be seen through the windshield from the outside of the vehicle (figure 2). On Forward Control models, the plate is on the dash and toe panel. To find out the

Figure 1—Service Parts Identification Label

manufacturer, model and chassis type, engine type, GVW range, model year, plant code, and sequential number, refer to figure 3.
The Certification Label shows the GVWR, and the front and rear GAWRs, and the Payload Rating for your vehicle (figure 4).

Gross Vehicle Weight (GVW) is the weight of the originally equipped vehicle and all items added to it after it has left the factory. This would include bodies, winches, booms, etc.; the driver and all occupants; and the load the vehicle is carrying. The GVW must not exceed the GVWR. Also, the front and rear gross axle weights must not exceed the front and rear GAWRs.

The Payload Rating shown on the label is the maximum allowable cargo load (including the weight of the driver and all occupants) that the vehicle can carry based on all factory installed equipment on the vehicle. The Payload Rating is reduced if any accessories or other equipment is added to the vehicle after final date of manufacture. The weight of these items should be determined and deducted from the Payload Rating.

The vehicle may also have a GCWR (Gross Combination Weight Rating). The GCW (Gross Combination Weight) is the total weight of the loaded tow vehicle (including passengers) and a loaded trailer.

The tires on the vehicle must be the proper size and properly inflated for the load which you are carrying. The vehicle Certification Label shows the originally equipped tire size and recommended inflation pressures. For more information on tires, refer to WHEELS AND TIRES (Sec.3E).

MODEL REFERENCE

Refer to figures 5 and 6 to determine the vehicle model. For R/V models, a "R" is a two-wheel drive vehicle and a "V" is a four-wheel drive vehicle.

ENGINE IDENTIFICATION NUMBER

Refer to figure 7 to determine the location of the engine I.D. number.
When lifting the R vehicle with a hoist, the rear hoist pads should be positioned under the rear spring front hangers.

When lifting the V vehicle with a hoist, the front hoist pads should be positioned under the frame, at the front body mount. The rear hoist pads should be positioned under the rear spring front hangers.

When lifting the front of the V vehicle with a floor jack, position the jack pad at the center of the axle, not under the front differential.

When lifting the P vehicle with a hoist, the rear hoist pads should be positioned under the frame and inboard of the rear spring front hangers.

When lifting the G vehicle with a hoist, the rear hoist pads should be positioned under the rear spring forward hangers.

**Figure 4—Certification Label**

**VEHICLE LIFTING PROCEDURES**

For lifting a vehicle, various lift points are recommended. Refer to figures 8, 9, 10, and 11.

Figure 11—Chassis Lift Points — P Model
Any time a vehicle is lifted with a vehicle jack or a floor jack, the wheels at the opposite end of the lifted end should be chocked. Also, jack stands should be used to provide support. When supporting the vehicle with jack stands, the jack stands should be placed under the frame, the front suspension crossmember or the axle.

When removing major components of the vehicle while the vehicle is on a hoist, the vehicle frame should be chained to the hoist pads in order to prevent tip-off.

**NOTICE:** When jacking or lifting a vehicle, be certain that the lift pads do not contact the catalytic converter, brake lines, brake cables, or fuel lines. Such contact may result in damage or unsatisfactory vehicle performance.

**EMERGENCY STARTING YOUR VEHICLE DUE TO A DISCHARGED BATTERY**

If your vehicle will not start due to a discharged battery, it can often be started by using energy from another battery - a procedure called “jump starting.”

Should your vehicle have an optional diesel engine with two batteries:
- P models and G Van models — use only the battery on the driver’s side when jump starting.
- R/V models — use only the battery on the passenger’s side when jump starting.

These battery locations are closer to the starter, thus reducing electrical resistance. Ignore the second battery.

**NOTICE:** Do not push or tow this vehicle to start it. Under some conditions this may damage the catalytic converter or other parts of the vehicle. Also, since this vehicle has a 12 volt battery, be sure the vehicle or equipment used to jump start your engine is also 12 volt. Use of any other type system may damage the vehicle's electrical components.

At low temperatures, it may not be possible to start your diesel engine from a single battery in another vehicle. However, you can use your vehicle to jump start another vehicle.

**JUMP STARTING INSTRUCTIONS**

**CAUTION:** Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:
- Always shield your eyes and avoid leaning over the battery whenever possible.
- Do not expose the battery to open flames or sparks.
- Be sure any batteries that have filler caps are properly filled with fluid.
- Do not allow battery acid to contact eyes of skin. Flush any contacted area with water immediately and thoroughly, and get medical help.
- Follow each step in the jump starting instructions.

**Make Connections in Numerical Order**

1. Position the vehicle with the good (charged) battery so that the booster (jumper) cables will reach, but never let the vehicles touch. Also, be sure booster cables do not have loose or missing insulation.
2. In both vehicles:
   - Turn off the ignition and all lights and accessories except the hazard flasher or any lights needed for the work area.
   - Apply the parking brake firmly, and shift the automatic transmission to Park (or manual transmission to Neutral).
3. Making sure the cable clamps do not touch any other metal parts, clamp one end of the first booster cable to the positive (+) terminal on one battery, and the other end to the positive terminal on the other battery (figure 12). Never connect (+) to (-).
4. Clamp one end of the second cable to the negative (-) terminal of the good (charged) battery and make the final connection to a heavy metal bracket (such as the mounting bracket for the generator or air conditioner compressor if so equipped) on the engine about 450 millimeters (18 inches) from the discharged battery. Make sure the cables are not on or near pulleys, fans, or other parts that will move when the engine is started.
5. Start the engine of the vehicle with the good (charged) battery and run the engine at a moderate speed for several minutes. Then, start the engine of the vehicle that has the discharged battery.
6. Remove the booster cables by reversing the above installation sequence exactly. While removing each clamp, take care it does not touch any other metal while the other end remains attached.

**GRAPHIC SYMBOLS**

Graphic symbols are used on some controls and displays on the vehicle (figure 13). Many of these symbols are used internationally.

B. 6 mm
C. 20 Threads Per Inch
D. 1 Thread Per Millimeter
(25.4 Threads Per Inch)

Figure 15—Thread Notation

Models are primarily dimensioned in the metric system. Many fasteners are metric and are very close in dimension to well-known customary fasteners in the inch system. It is most important that replacement fasteners be of the correct nominal diameter, thread pitch and strength.

Original equipment metric fasteners (except “beauty” bolts, such as exposed bumper bolts, and cross recess head screws) are identified by a number marking indicating the strength of the material in the fastener as outlined later. Metric cross recess screws are identified by a Posidriv or Type 1A shown in figure 14. Either a Phillips head or Type 1A cross recess screwdriver can be used in Posidriv recess screw heads, but Type 1A cross recess screwdrivers will perform better.

NOTICE: Most metric fasteners have a blue color coating. However, this should not be used as positive identification as some fasteners are not color coated.

General Motors Engineering Standards, along with other North American Industries, have adopted a portion of the standard metric fastener sizes defined by ISO (International Standards Organization). This was done to reduce the number of fastener sizes used and yet retain the best strength qualities in each thread size. For example, the customary 1/4-20 and 1/4-28 screws are replaced by the metric M6.0X1 screw which has nearly the same diameter and has 25.4 threads per inch. The thread pitch is in between the customary coarse and fine thread pitches.

Metric and customary thread notation differ slightly. The difference is shown in figure 15.

FASTENER STRENGTH IDENTIFICATION

Most commonly used metric fastener strength property classes are 9.8 and 10.9 with the class identification embossed on the head of each bolt. Customary (inch) strength classes range from grade 2 to 8 with radial line identification embossed on each bolt head. Markings correspond to two lines less than the actual grade (i.e. grade 7 bolt will exhibit 5 embossed radial lines on the bolt head). Some metric nuts will be marked with single digit strength identification numbers on the nut face. Figure 14 shows the different strength markings.

When replacing metric fasteners, be careful to use bolts and nuts of the same strength or greater than the original fasteners (the same number marking or higher). It is likewise important to select replacement fasteners of the correct size. Correct replacement bolts metric fasteners available in the aftermarket parts channels were designed to metric standards of countries other than the United States, and may be of a lower strength, may not have the numbered head marking system, and may be of a
**PREVAILING TORQUE FASTENERS**

A prevailing torque nut is designed to develop an interference between the nut and bolt threads. This is most often accomplished by distortion of the top of an all-metal nut by using a nylon patch on the threads in the middle of the hex flat. A nylon insert may also be used as a method of interference between nut and bolt threads (figure 16).

A prevailing torque bolt is designed to develop an interference between bolt and nut threads, or the threads of a tapped hole. This is accomplished by distorting some of the threads or by using a nylon patch or adhesive (figure 12).

---

**DIFFERENT THREAD PITCH**

The metric fasteners used on GM products are designed to new, international standards that may not yet be manufactured by some non-domestic bolt and nut suppliers. In general, except for special applications, the common sizes and pitches are:

- M6.0 x 1
- M 8 x 1.25
- M 10 x 1.5
- M 12 x 1.75

**RECOMMENDATIONS FOR REUSE:**

1. Clean, unrusted prevailing torque nuts and bolts may be reused as follows:
   a. Clean dirt and other foreign material off the nut or bolt.
   b. Inspect the nut or bolt to ensure there are no cracks, elongation, or other signs of abuse or overtightening. (If there is any doubt, replace with a new prevailing torque fastener of equal or greater strength).
   c. Assemble the parts and hand start the nut or bolt.
   d. Observe that, before fastener seats, it develops torque per the chart in figure 10 (if there is any doubt, replace with a new prevailing torque fastener of equal or greater strength).
   e. Tighten the fastener to the torque specified in the appropriate section of this manual.

2. Bolts and nuts which are rusty or damaged should be replaced with new parts or equal or greater strength.

---

**Figure 16—Torque Nuts and Bolts Chart**
Figure 17—Six Lobed Socket Head Fasteners

**SIX LOBED SOCKET HEAD FASTENERS**

Six lobed socket head fasteners are used in some applications on vehicles covered in this manual (figure 17). The door striker bolt is of this design. Tools designed for these fasteners are available commercially. However, in some cases, if the correct tool is not available, a hex socket head wrench may be used.

CAPACITIES

Figures 2 through 6 show the approximate capacities of the differential gear, the transmission, the cooling system, the crankcase, the fuel tank, the front axle and the transfer case. Engine code letters are used in the charts. Refer to figure 1 for an explanation of the code.

SELECTING YOUR VEHICLE’S MAINTENANCE

DETERMINING VEHICLE EMISSIONS CLASSIFICATION

To determine the emissions classification for your vehicle, refer to the “Engine Emission Classification by VIN Code” chart. This chart classifies your engine as a Light Duty Emissions Engine or Heavy Duty Emissions Engine using the engine code identifier of the Vehicle Identification Number (VIN).

The VIN is located on the plate on the top left corner of the instrument panel. (It is also on the Certification Label and the Service Parts Identification Label.) The Engine Code is the eighth character in this number. Locate your vehicle's Engine Code on the following Engine Emission Classification Chart to determine your vehicle's emissions class.

SELECTING THE PROPER MAINTENANCE CHART

Select the proper maintenance from pages 6 through 13 depending on your vehicle's engine (gas or diesel) and engine emissions classification.

SELECTING THE PROPER MAINTENANCE SCHEDULE

Select and follow either Maintenance Schedule 1 or Maintenance Schedule 2 based on how you use your vehicle.

MAINTENANCE SCHEDULE 1

Follow Maintenance Schedule 1 denoted by a white circle (○) if you mainly operate your vehicle under one or more of the following conditions:
- When most trips are less than 4 miles (6 kilometers).
- When most trips are less than 10 miles (16 kilometers) and outside temperatures remain below freezing.
- Towing a trailer.
- Operating in dusty areas.
- Idling and/or low-speed operation in stop-and-go traffic.

NOTE: Schedule 1 should also be followed if the vehicle is used for delivery service, police, taxi, or other commercial applications.

MAINTENANCE SCHEDULE 2

Follow Maintenance Schedule 2 denoted by a black circle (●) only if none of the driving conditions specified in Maintenance Schedule 1 apply.

### FOOTNOTES:

1. In California, these are the minimum Emission Control Maintenance Services an owner must perform according to the California Air Resources Board. General Motors, however, urges that all Emission Control Maintenance Services shown be performed. To maintain your other new vehicle warranties, all services shown in this booklet should be performed.

2. For vehicles with engine VIN Code J (RPO LL4), replace element every 15,000 miles (24,000 km).

* An Emission Control Service

■ Applicable only to trucks sold in the United States.

▲ Also, a Noise Control Service (applicable to vehicles with engine VIN Code J (RPO LL4).

† This maintenance schedule applies to all diesel emission classifications.

**NOTE:** Refer to Section 0 of your owner's manual for VIN code identification information.

### 1987 VEHICLE WITH A 6.2 L DIESEL ENGINE †

The maintenance services contained in Maintenance Schedule 1 and 2 are based on the assumption that your vehicle will be used as designed:

- To carry passengers and cargo within the limits shown on the tire placard located on the edge of the driver's door.
- With No. 1, blend or No. 2 grade diesel fuel.
- On reasonable road surfaces within legal driving limits.

SECTION B — EXPLANATION OF SCHEDULED MAINTENANCE SERVICES

The services listed in the preceding Maintenance Schedules are further explained below. After services are completed, fill in the Maintenance Record at the end of this booklet. When the following maintenance services are performed, make sure all parts are replaced and all necessary repairs are done before operating your vehicle. Be sure to use the proper fluids and lubricants as shown in Section E.

Item No.

1. ENGINE OIL AND OIL FILTER CHANGE * — ALWAYS USE SF/CC or SF/CD QUALITY, ENERGY CONSERVING OILS OF THE PROPER VISCOSITY. Also always change oil and filter as soon as possible after driving in a dust storm. Refer to Section 5 of your Owner's Manual for further details.

2A. CHASSIS LUBRICATION — Lubricate the front suspension (except when equipped with "maintenance-free" ball joint), steering linkage, transmission, clutch, and transfer case shift linkage, parking brake cable guides, propshaft, universal joints, brake pedal springs, and clutch pedal springs. On vehicles without hydraulic clutches lubricate clutch cross shaft every 30,000 miles (50,000 km).

2B. CLUTCH FORK BALL STUD — Refer to the Service Parts Identification Label located on the inside of the glove box. Match the three digit/RPO code to the appropriate RPO code below. Follow the maintenance as detailed for your particular vehicle.

RPO codes: MC0, MG5, M20, MY6, M62, M64 — Lubricate the clutch fork ball stud through the fitting on the clutch housing found on some models. Lubricate this ball stud "sparingly," as too much lubrication may cause problems with the clutch assembly.

3. ENGINE IDLE SPEED ADJUSTMENT (CARBURETED ENGINES ONLY) * — Adjust to the specifications shown on the underhood label. You must use calibrated test equipment. Check that idle stop solenoid or dashpot work properly (if so equipped).

4. COOLING SYSTEM SERVICE * — Drain, flush and refill system with new coolant. Refer to Section 5 of your Owner's Manual for further details.

5. AIR CLEANER ELEMENT REPLACEMENT, A.I.R. AND PCV FILTER REPLACEMENT (SOME MODELS) * — Replace at specified intervals. Replace more often under dusty conditions. Ask your dealer for the proper replacement intervals for your driving conditions.

6. FRONT WHEEL BEARING REPACK — Clean and repack the front wheel bearings at each brake relining, or at the specified interval, whichever comes first.

* An Emission Control Service
7. TRANSMISSION SERVICE

Automatic Transmission — Change the transmission fluid and filter every 15,000 miles (25,000 km) for vehicles under 8600 GVWR or every 12,000 miles (20,000 km) for vehicles over 8600 GVWR if the vehicle is mainly driven under one or more of these conditions:

- In heavy city traffic where the outside temperature regularly reaches 90°F (32°C) or higher.
- In hilly or mountainous terrain.
- Frequent trailer pulling.
- Uses such as taxi, police, delivery or other commercial service.

If the vehicle is not used mainly under any of these conditions, change the fluid and filter every 30,000 miles (50,000 km) for vehicles under 8600 GVWR or every 24,000 miles (40,000 km) for vehicles over 8600 GVWR. Refer to Section 5 of your Owner’s Manual for further details.

Manual Transmission — Refer to the Service Parts Identification Label located on the inside of the glove box. Match the three digit/RPO code to the appropriate RPO code below. Follow the maintenance schedule recommended for your particular transmission.

RPO Code:
- M73 (4-Speed)
  — Change transmission fluid at 7,500 miles (12,500 km), then every 30,000 miles (50,000 km).

RPO Codes:
- M62 and M64 (3-Speed)
- M20, MCO, MG9, and MF2 (4-Speed)
- MY6 (4-Speed Overdrive)
- ML2, ML3, MH3 (5-Speed)
- MG5 (5-Speed Overdrive)
  — Transmission fluid does not require periodic changing.

8A. PCV SYSTEM INSPECTION * — Check that PCV (Positive Crankcase Ventilation) system works properly. Replace the valve and any worn, plugged or collapsed hoses as necessary.

8B. CDRV System Inspection * — Check the Crankcase Depression Regulator Valve System for any worn, plugged or collapsed hoses. Have the system checked as described in the Service Manual.

9. FUEL FILTER REPLACEMENT * — Replace the fuel filter at the specified interval or sooner if clogged.

10. CARBURETOR CHOKE AND HOSES INSPECTION * — Verify that choke and vacuum break work properly and within specifications. Correct any binding caused by damage or gum on the choke shaft. Inspect hoses for proper hookup, cracks, chafing, or decay. Correct as necessary.

* An Emission Control Service
11. VACUUM ADVANCE SYSTEM INSPECTION * — Check that the system works properly. Check hoses for proper hookup, cracks, chafing or decay. Replace parts as needed.

12. SPARK PLUGS * — Replace spark plugs with the type listed in Section 6 of your Owner's Manual.

13. SPARK PLUG WIRE INSPECTION * — Clean wires and inspect for burns, cracks or other damage. Check the wire boot fit at the distributor and at the spark plugs. Replace wires as needed.

14. EGR SYSTEM INSPECTION * — Conduct EGR SYSTEM CHECK as referenced in the Maintenance and Lubrication Section of the Service Manual.

15. ELECTRONIC VACUUM REGULATOR VALVE (EVRV) INSPECTION * — Inspect filter for excessive contamination or plugging. If required, clean element with a solution of biodegradable soap and water, let dry and reinstall element.

16. ENGINE TIMING CHECK AND DISTRIBUTOR CHECK (SOME MODELS)* — Adjust timing to underhood label specifications. Inspect the inside and outside of the distributor cap and rotor for cracks, carbon tracking and corrosion. Clean or replace as needed.

17. FUEL TANK, CAP AND LINES INSPECTION * — Inspect the fuel tank, cap and lines for damage or leaks. Remove fuel cap, inspect gasket for an even filler neck imprint, and any damage. Replace parts as needed.

18. EARLY FUEL EVAPORATION (EFE) SYSTEM INSPECTION * — Check that valve works properly; correct any binding. Check that thermal vacuum switch works properly. Check hoses for cracks, chafing, or decay. Replace parts as needed.

19. THERMOSTATICALLY CONTROLLED AIR CLEANER INSPECTION * — (If so equipped.) Inspect all hoses and ducts for proper hookup. Make sure valve works properly.

20. ENGINE ACCESSORY DRIVE BELTS INSPECTION * — Inspect belts. Look for cracks, fraying, wear, and proper tension. Adjust or replace as needed.

21. EVAPORATIVE CONTROL SYSTEM (ECS) INSPECTION * — Check all fuel and vapor lines and hoses for proper hookup, routing, and condition. Check that bowl vent and purge valves work properly. Remove canister, and check for cracks or damage. Replace as needed.

22. SHIELDS AND UNDERHOOD INSULATION INSPECTION ▲ ■ — Inspect shields and underhood insulation for damage or looseness. Adjust or replace as required.

* An Emission Control Service
▲Also a Noise Emission Control Service
■ Applicable only to vehicles sold in the United States
23. **AIR INTAKE SYSTEM INSPECTION** — Check the air intake system installation to see that gaskets are seated properly and all hose connections, fasteners, and other components are tight. Also check to be sure that the air cleaner housing is properly seated, that the cover fits tightly, and the wingnut(s) is tight. Tighten connections and fasteners or replace damaged parts as required.

24. **THERMOSTATICALLY CONTROLLED ENGINE COOLING FAN INSPECTION** — (If so equipped.) With the engine off and below normal operating temperature, check to see that the fan can be rotated by hand on fluid coupling or viscous drives. Replace as necessary.

25. **MANIFOLD HEAT VALVE CHECK** — Some engines are equipped with a manifold heat valve which should be inspected and repaired as necessary to insure free operation.

26. **IDLE SPEED CONTROL DEVICE** — Check that parts work properly. Replace them as needed.

27. **THROTTLE RETURN CONTROL (TRC) SYSTEM INSPECTION** — Inspect hoses for proper connections, cracking, abrasion, or deterioration and replace as necessary. Check for proper operation of system. Check for shorted or broken wires and ensure electrical connectors are fully engaged at distributor, speed switch and vacuum solenoid.

28. **ENGINE IDLE MIXTURE ADJUSTMENT (4.8 L ONLY)** — At designated intervals or in case of a major carburetor overhaul, or when poor idle quality exists, adjust mixture by a mechanical method (lean drop), following the specifications shown on the label under the hood.

29. **GOVERNOR CHECK** — (If so equipped). Check the engine no-load governed speed and reset to specifications as required.

30. **EXHAUST PRESSURE REGULATOR VALVE INSPECTION** — Check that valve works properly. Correct any binding. Inspect hoses for cracks, chafing or decay. Replace parts as needed.

31. **TIRE ROTATION AND WHEEL INSPECTION** — Rotate your tires at the specified maintenance service interval as follows:
   - **Schedule 1 (C)** — Every 6,000 miles (10,000 km).
   - **Schedule 2 (©)** — Every 7,500 miles (12,500 km).

   Inspect tires and wheels for abnormal wear or damage. Refer to Section 5, “Tires” in your Owner’s Manual for further information. For dual wheels, whenever the vehicle, wheels, or fasteners are new, have the wheel fastener torque set at the first 100,1,000, and 6,000 miles (160, 1,600, and 10,000 km).

* An Emission Control Service

**Also a Noise Emission Control Service**

■ Applicable only to vehicles sold in the United States
Listed below are inspections and services which should be made by either you or a qualified technician at the intervals shown to help ensure proper safety, emission performance and dependability of your vehicle. Take any problems promptly to your dealer or another qualified technician for service advice. Whenever repairs are necessary, have them completed at once. For your safety and that of others, any safety-related parts that could have been damaged in an accident should be inspected, and all needed repairs should be done before operating your vehicle. Be sure to use the proper fluids and lubricants as shown in Section E.

**WHILE OPERATING YOUR VEHICLE**

- **Automatic transmission shift indicator operation** — Make sure the indicator points to the gear chosen.
- **Horn operation** — Blow the horn occasionally to make sure it works. Check all button locations.
- **Brake system operation** — Be alert to abnormal sounds, increased brake pedal travel or repeated pulling to one side when braking. Also, if a brake warning light goes on, something may be wrong with part of the brake system.
- **Exhaust system** — Be alert to any changes in the sound of the system or any smell of fumes. These are signs the system may be leaking or overheating. Have it inspected and repaired at once. Also, refer to Section 2 “Engine Exhaust Gas Caution (Carbon Monoxide),” and Section 5 “Catalytic Converter” in your Owner’s Manual.
- **Tire and wheel** — Be alert to a vibration of the steering wheel or seat at normal highway speeds. This may mean a wheel balance is needed. Also, a pull right or left on a straight, level road may show the need for a tire pressure adjustment or wheel alignment.
- **Steering system operation** — Be alert to changes in steering action. An inspection is needed when the steering wheel is harder to turn or has too much free play or if abnormal sounds are noted when turning or parking.
- **Headlight aim** — Take note of the light pattern occasionally. If beam aim doesn’t look right, headlights should be adjusted.

**AT EACH FUEL FILL**

- **Engine oil level check** † — Check engine oil level and add if necessary. Refer to Section 5 of your Owner’s Manual for further details.

† A large loss in these systems may indicate a problem. Have them inspected and repaired at once.
Engine coolant level and condition † — Check engine coolant level in coolant reservoir tank and add if necessary. Replace if dirty or rusty. Refer to Section 5 of your Owner's Manual for further details.

Windshield washer fluid level check — Check washer fluid level in container and add if necessary.

Hood latch operation — When opening hood, note the operation of secondary latch. It should keep hood from opening all the way when primary latch is released. Make sure that hood closes firmly.

**AT LEAST MONTHLY**

Tire pressure check and wheel inspection — Keep pressures as shown on Tire Placard on the driver's door (including spare). Pressure should be checked when tires are cold. Inspect tires and wheels for abnormal wear or damage. Refer to Section 5, "Tires" in your Owner's Manual for further information.

Light operation check — Check operation of license plate light, side marker light, headlights including high beams, parking lights, taillights, brake lights, turn signals, backup lights, instrument panel illumination and hazard warning flashers.

Fluid leak check — After the vehicle has been parked for a while, inspect the surface beneath the vehicle for water, oil, fuel or other fluids. Water dripping from the air conditioning system after use is normal. If you notice fuel leaks or fumes, the cause should be found and corrected at once.

**AT LEAST TWICE A YEAR (FOR EXAMPLE, EVERY SPRING AND FALL)**

Power steering pump level check † — Check power steering pump fluid in accordance with the instructions in Section 5 of your Owner's Manual and add fluid if necessary.

Brake master cylinder reservoir fluid level check † — Check fluid level in accordance with the instructions in Section 5 of your Owner's Manual, and add fluid if necessary. A low fluid level can indicate that worn disc brake pads may need to be serviced.

Clutch pedal free travel (except hydraulic clutch) — Check the clutch pedal free travel. The free travel should be about one inch. Adjust linkage whenever there is little or no free travel.

Key lock cylinder — Lubricate key lock cylinders. Lock deicers which contain alcohol may wash away lubricants. It is recommended that you lubricate the lock cylinder after you have used a deicer of this type. Refer to Section E in this booklet for the proper lubricants.

† A large loss in these systems may indicate a problem. Have them inspected and repaired at once.
Weatherstrip lubrication — Clean surface and then apply a thin film of silicone grease with a clean cloth.

EACH TIME OIL IS CHANGED

Automatic or manual transmission fluid level check † — Check transmission fluid level and add as required. Refer to Section 5 of your Owner's Manual for further details.

Steering and suspension † — Inspect front and rear suspension and steering system for damaged, loose or missing parts, signs of wear or lack of lubrication. Inspect power steering lines and hoses for proper hookup, binding, leaks, cracks, chafing, etc. (On vehicles equipped with manual steering gear, check for seal leakage.) Inspect final drive axle output shaft seals for leaking.

Brake systems inspection — For convenience the following should be done when wheels are removed for rotation: Inspect lines and hoses for proper hookup, binding, leaks, cracks, chafing, etc. Inspect disc brake pads for wear and rotors for surface condition. Also inspect drum brake linings for wear and cracks. Inspect other brake parts, including drums, wheel cylinders, parking brake, etc. at the same time. Check parking brake adjustment. Inspect brakes more often if driving habits or conditions result in frequent braking.

Exhaust system inspection * — Inspect complete system including catalytic converter. Inspect body near the exhaust system. Look for broken, damaged, missing or out-of-position parts, as well as, open seams, holes, loose connections or other conditions which could cause a heat buildup in the floor pan or could let exhaust fumes seep into the passenger compartments.

Throttle linkage inspection — Inspect for interference, binding, damaged or missing parts. Replace parts as needed.

Engine drive belts inspection — Inspect all belts for cracks, fraying, wear and proper tension. Adjust or replace as needed.

Axle rear/front, transfer case (four-wheel drive) — Refer to Section 0 in your Owner's Manual to determine the GVWR for your vehicle. Check fluid level and add if needed.

- **Locking differential - under 8600-lbs. GVWR** — Drain fluid at first oil change and refill. Check fluid level and add as needed at subsequent oil changes. In dusty areas, or trailer towing applications drain fluid at every oil change and refill. †

- **Locking differential - over 8600-lbs. GVWR** — Drain fluid at first oil change and refill. Change fluid at every other oil change and check and add fluid at subsequent oil changes. In dusty areas, or trailer towing applications, drain fluid at every oil change and refill as specified. †

† A large loss in these systems may indicate a problem. Have them inspected and repaired at once.

* An Emission Control Service
• **Standard differential - under 8600-lbs. GVWR** — Check fluid level and add as needed at every oil change. In dusty areas, or trailer towing applications, drain fluid every oil change and refill. †

• **Standard differential - over 8600-lbs. GVWR** — Drain fluid every fourth oil change and refill. Check fluid level and add as needed at every oil change. In dusty areas, or trailer towing applications, drain fluid at every oil change and refill. †

• **Transfer case (four-wheel drive)** — Every 12 months or at oil change intervals, check front axle and transfer case and add lubricant when necessary. Lubricate propeller shaft slip joint, constant velocity universal joint and steering linkage. Oil the control lever pivot point and all exposed control linkage. Oil the control lever pivot point and all exposed control linkage. Check vent hose at transfer case for kinks and proper installation. More frequent lubrication may be required on heavy-duty off-road use. †

**AT LEAST ONCE A YEAR**

Starter safety switch operation —

---

**CAUTION:** Before performing the following safety switch check, be sure to have enough room around the vehicle. Then, firmly apply both the parking brake (see your Owner’s Manual for procedure) and the regular brakes. Do not use the accelerator pedal. If the engine starts, be ready to turn off the ignition promptly. Take these precautions because the vehicle could move without warning and possibly cause personal injury or property damage.

• On automatic transmission vehicles, try to start the engine in each gear. The starter should crank only in “Park” or “Neutral.”

• On manual transmission vehicles place the shift lever in “Neutral,” push the clutch halfway and try to start. The starter should crank only when the clutch is fully depressed.

**Steering column lock operation** — While parked, try to turn key to “Lock” position in each gear range. The key should turn to “Lock” only when gear is in “Park” on automatic or “Reverse” on manual transmission. On vehicles with a key release lever, try to turn the key to “Lock” without depressing the lever. The key should turn to “Lock” only with the key lever depressed. On all vehicles, the key should come out only in “Lock.”

† A large loss in these systems may indicate a problem. Have them inspected and repaired at once.
Parking brake and transmission "Park" mechanism operation—

CAUTION: Before checking the holding ability of the parking brake and automatic transmission "Park" mechanism, park on a fairly steep hill with enough room for movement in the downhill direction; to reduce the risk of personal injury or property damage, be prepared to apply the regular brakes promptly if the vehicle begins to move.

- To check the parking brake with the engine running and transmission shift lever in "Neutral," slowly remove foot pressure from the regular brake pedal until the vehicle is held by only the parking brake.
- To check the automatic transmission "Park" mechanism holding ability, release all brakes after shifting the transmission to "Park."

Lap and shoulder belts condition and operation — Inspect belt system, including: webbing, buckles, latch plates, retractors, guide loops and anchors. Have any defects repaired immediately.

Seatback latch and recliner operation on vehicles equipped with recliner seat — Be sure seatbacks latch on those vehicles with folding seats using mechanical latches. Make sure the recliner is holding by pushing and pulling on the top of the seatback while it is reclined. Refer to Section 1 of your Owner's Manual for seat operating information.

Spare tire and jack storage — Be alert to rattles in the rear of the vehicle. Make sure the spare tire, all jacking equipment, and any covers or doors are securely stowed at all times. Oil the jack ratchet or screw mechanism after each use.

Underbody flushing — At least every spring, flush the underbody with plain water to remove any corrosive materials used for ice and snow removal, and dust control. Take care to thoroughly clean any areas where mud and other debris can collect. Sediment packed in closed areas of the vehicle should be loosened before being flushed.

Engine cooling system service *† — Inspect coolant and freeze protection. If dirty or rusty, drain, flush and refill with new coolant. Keep coolant at the proper mixture as specified in Section 5 of your Owner's Manual. This provides proper freeze protection, corrosion inhibitor level and engine operating temperature. Inspect hoses and replace if cracked, swollen or deteriorated. Tighten hose clamps. Clean outside of radiator and air conditioning condenser. Wash radiator filler cap and neck. To help ensure proper opera-

† A large loss in these systems may indicate a problem. Have them inspected and repaired at once.
tion, a pressure test of both the cooling system and cap is also recommended. See maintenance schedule charts in Section A for the recommended coolant change interval.

**Body Lubrication Service** — Lubricate all body door hinges including the tailgate (if equipped) also lubricate the body hood, fuel door and rear compartment hinges and latches including interior glove box and console doors, and any folding seat hardware.

R/V AND G SERIES HEATERS—DESCRIPTION

Heating components are attached to the right side of the cowl. The blower and air inlet assembly and water hoses are located on the forward side of the cowl panel while the heater core and distributor duct are on the passenger side.

The heater system is an air-mix type system in which outside air is heated and then mixed in varying amounts with cooler outside air to attain the desired air temperature. The system consists of (1) a blower and air inlet assembly, (2) a heater distributor assembly and (3) a heater control assembly.

BLOWER AND AIR INLET ASSEMBLY

The blower and air inlet assembly draws outside air through the outside air inlet grille located forward of the windshield reveal molding and channels the air into the heater distributor assembly. The operation of the blower motor is controlled by the fan switch on the heater control. The motor is connected in series with the fan switch and the blower resistor assembly.

HEATER DISTRIBUTOR ASSEMBLY

The heater distributor assembly houses the heater core and the doors necessary to control mixing and channeling of the air. Since the unit has no water valve, water circulation keeps the core hot at all times. That portion of the air passing through the core receives maximum heat from the core. Air entering the distributor assembly is channeled as follows:

Air entering the distributor can be directed out the purge door opening on the right end of the distributor assembly by the temperature door. If the temperature door is closed, air is directed through and/or around the heater core by the temperature door. Air is then directed into the passenger compartment through the heater (floor) outlets and/or the defroster (dash) outlets by the defroster door. The temperature of the outlet air is dependent on the ratio of heated to unheated air (controlled by the temperature door).

FUNCTIONAL TEST

Perform this test as one operation:
1. For R/V Series, refer to figure 1.
2. For G Series, refer to figure 2.
FUNCTIONAL TEST—R-V SERIES

Perform this test as one operation by one inspector in one station roll-off test.

Hot Air Check

With the mode lever in defrost and the temperature lever in hot, the fan switch in HI, the temperature from the defroster outlet should be above the temperature outside the vehicle.

R/V SERIES AUXILIARY HEATER

DESCRIPTION

An auxiliary heater provides additional heating capacity for the rear of the Suburban model. This unit operates independently of the standard heater, and is regulated through its own controls at the instrument panel.

This system consists of a separate core and fan unit mounted in the rear of the vehicle.

Heater hoses extend from the unit to the front of the vehicle where they are connected to the standard heater hoses with “tees.” An “on-off” vacuum operated valve is installed in the heater core inlet line in the engine compartment. This valve cuts off coolant flow to the auxiliary core during warm weather and eliminates radiant heat (figure 18).

Two control methods are used:

COOLANT-CONTROL VALVE

When heat is desired, and the blower switch is in any position except off, a vacuum operated valve controlled by the switch, opens the coolant line to permit hot coolant circulation through the heater core. In the OFF position the valve is closed to prevent unwanted heat.

BLOWER SWITCH

The three-speed blower switch is located in the instrument panel to the right of the steering column.

**HEATER HOSE ROUTING**

Heater hoses are routed from the thermostat housing or inlet manifold and water pump (radiator on some automatic transmission vehicles) to the core inlet and outlet pipes. Hoses are attached at each end with screw-type clamps. (Refer to figures 20, 21 and 22).

**REPLACEMENT**

When replacing heater hoses, maintain a 13 mm (1/2-inch) minimum clearance between the hose clip and the upper control arm, a 38 mm (1 1/2-inch) minimum clearance between the hoses and the propshaft, and a 32 mm (1 1/4-inch) minimum clearance between the auxiliary heater core lines and the exhaust pipe.

The heater core can be damaged near the tube attachment seams if force is applied on them. If the heater hoses do not come off, cut the hoses forward of the core tubes. Cut the hose on the core tubes to remove.

**Important**

- Draw hoses tight to prevent sagging or rubbing against other components. Route hoses through all clamps as installed originally.

G SERIES AUXILIARY HEATER

DESCRIPTION
An auxiliary heater provides additional heating for the rear area of the vehicle.
It operates independently of the standard heater, and is regulated through its own control at the instrument panel.
This system consists of a separate core fan vent (figures 27 and 28).
Heater hoses extend from the unit to the front of the vehicle where they are connected to the standard heater hoses with "tees."
There are two control methods:

COOLANT-CONTROL VALVE
An "on-off" vacuum-operated, coolant-control valve installed in the heater core inlet in the engine compartment controls coolant flow to the auxiliary heater and eliminates radiant heat during warm weather. To diagnose the vacuum system refer to AIR CONDITIONING (SEC. 1B).

BLOWER SWITCH
For heating, the blower switch is placed in any position except off. The switch opens the coolant-control valve which permits hot coolant to enter the heater core. In the OFF position, the valve is closed to prevent unwanted heat during warm weather.

CCOT A/C SYSTEM

The CCOT (Cycling Clutch Orifice Tube) A/C system performs heating and cooling. Air enters the vehicle and passes through the cooling unit (evaporator) and through (or around) the heating unit. The system is called a "reheat" system. The evaporator cools the air passing through the core when the air conditioning system is in the cooling mode.

On R/V and G series, a pressure sensing switch, located near the top of the accumulator, controls compressor operation. The switch responds to pressure changes to turn the compressor ON or OFF.

System operation:

Outside air or recirculated air enters the system and is forced through the system by the blower. As the air passes through the evaporator core, it receives maximum cooling if the air conditioning controls are positioned for cooling.

From the evaporator, the air enters the heater and air conditioner selector duct assembly where, by means of diverter doors, it passes through or bypasses the heater core in proportions necessary to provide the desired outlet temperature. The air enters the vehicle through either the floor distributor duct or the dash outlets.

During cooling, the air is cooled by the evaporator to below comfort level then warmed by the heater to the desired temperature. During "heating only" the evaporator does not operate, and ambient air is warmed to the desired level in the same manner.

REAR INTERIOR ROOF MOUNTED SYSTEMS (SUBURBAN & G SERIES)

These systems operate with the front system - they do not operate independently. However, control of the rear...
blower motor speed is possible when the front system is OFF. Rear air circulation without the refrigerant function is possible by operating the rear blower control switch.

These self-contained units operate on inside (recirculated) air. Air enters the unit and passes through the evaporator core into the passenger compartment through the air distributor duct. The front system controls the rear system. A three-speed blower switch controls the rear interior roof mounted system.

SYSTEM COMPONENTS

THERMOSTATIC EXPANSION VALVE
Suburban and G rear interior roof mounted and motor home chassis systems use a thermostatic expansion valve (figure 1).

The valve consists of the power element, body, actuating pins, seat and orifice. At the high pressure liquid inlet, a fine mesh screen prevents dirt, filings or other foreign matter from entering the valve orifice.

When the valve is connected in the system, high pressure liquid refrigerant enters the valve through the screen from the receiver-dehydrator or condenser and passes on to the seat and orifice where it changes into a low pressure liquid.

The low pressure liquid leaves the valve and flows into the evaporator core where it absorbs heat from the evaporator core and changes to a low pressure vapor and leaves the evaporator core. The power element bulb is clamped to the low pressure vapor line just beyond the outlet of the evaporator.

ACCUMULATOR R/V & G SERIES
The accumulator is located at the evaporator outlet. It separates liquid retained from vapor, retains the liquid and releases the vapor to the compressor (figure 2).

Flow from the accumulator to the compressor consists of vapor, entrained liquid and liquid flow through the oil bleed hole.

A bag of desiccant (dehydrating agent), located in the accumulator, collects moisture.

There is no sight glass in the accumulator with the CCOT system.

ORIFICE (EXPANSION TUBE) R/V & G SERIES
Pressure differences and sub-cooling determines expansion tube flow. The orifice is located in the evaporator inlet line (figure 3).

CYCLING PRESSURE SWITCH
This switch controls evaporator temperature. It cycles the compressor clutch off when the evaporator temperature gets too low. It cycles the compressor back on after evaporator temperature has increased (figure 4).

Figure 4—Pressure Cycling Switch

The cycling pressure switch provides inherent compressor protection so a separate low pressure switch is not necessary. The switch also acts as an ambient switch since at ambient freezing temperatures it will not allow the compressor to engage. Adjusting the set screw one-half turn left or right will rise or lower the settings 20.7 kPa (3 psi).

PERIODIC MAINTENANCE AND SERVICING
Inspect the system once a year, preferably in the spring before warm weather.
Check refrigerant lines for leaks.
Check refrigerant charge; evaluate and recharge as necessary.

SYSTEM OPERATION — RV & G
For information on selector switch, select valve and fan switch operating characteristic, refer to figures 5 and 6.

FUNCTIONAL TEST—RV & G
To check the operation of the control assembly, perform these tests as one complete operation, refer to figures 7 and 8.

**REMARKS**

A. Detent engagement must be felt in each mode.
B. Blower speed increase must occur from low, medium 1, medium 2, and high.
C. Listen for the reduction of air noise due to recirculation door closing.
D. Check temperature lever for effort.

**NOTE**

Check outlets for:
1. Barrel rotation.
2. Vane operation.
3. Barrel and vanes must hold position in high blower.

**Cold/Hot Air Check**

1. With the mode lever in maximum, the temperature lever in cold, the blower switch in high, the temperature from the center outlet should drop 20° from the temperature outside the vehicle (in room temperature or warmer conditions).
2. With the mode lever in (defrost), the temperature lever in hot, the blower switch in high, the temperature from the defrost outlet should be above the temperature outside the vehicle.

Figure 8—Functional Test — G
REFRIGERANT-12 OPERATING CHARACTERISTICS

SYSTEM COMPONENTS, TEMPERATURE AND PRESSURE RELATIONSHIPS

To review system components and Refrigerant-12 flow, refer to figure 9.
To find the pressure and temperature relationship between Refrigerant-12 and atmospheric pressure, refer to figure 10.

REFRIGERANT AND OIL CAPACITY

The refrigerant system requires refrigerant and oil in quantities listed:
1. Refrigerant-12 —
   R/V Models .................... 1.588 Kg (3 lbs. 8 ozs.)
   G Models ....................... 1.588 Kg (3 lbs. 8 ozs.)
   Rear Interior System
   RA?- Models .................... 2.381 Kg (5 lbs. 4 ozs.)
   G Models ....................... 2.041 Kg (4 lbs. 8 ozs.)
2. 525 Viscosity Oil — 0.284 Kg (10 oz.).

HANDLING REFRIGERANT-12

Air conditioning systems contain Refrigerant-12, a chemical which requires special handling to avoid personal injury.
Always wear goggles and wrap a clean cloth around fittings, valves and connections when opening the system. Work in a ventilated area and do not weld or steam clean near air conditioning lines or components.
Refrigerant-12 drums are shipped with a metal screw cap that protects the valve and safety plug from damage. Replace the cap after each use.
Do not carry a container of Refrigerant-12 in the passenger compartment of a vehicle. Never subject any container to high temperatures. Do not breathe the smoke or fumes produced by burning Refrigerant-12.
If Refrigerant-12 touches exposed flesh do the following:
• Treat the area as if it were frost bitten or frozen.
• Call a doctor or eye specialist and obtain treatment.
• DO NOT RUB THE EYE. Splash the area with cold water to raise temperature above the freezing point.
• Use an antiseptic oil to provide a protective film over the eyeball to reduce the possibility of infection.

HANDLING OF REFRIGERANT LINES AND FITTINGS

Tighten tubing connections to the specified torque (figure 11). Insufficient or excessive torque causes loose joints or deformed joint parts. Either condition can cause refrigerant leakage.
• All metal tubing lines should be free of dents or kinks to prevent loss of system capacity due to a line restriction.

MAINTAINING CHEMICAL STABILITY

The efficient operation of the air conditioning refrigeration system is dependent upon the chemical stability of Refrigerant-12.
Foreign matter can change the stability of Refrigerant-12, cause corrosion and wear. Do the following:
1. Before disconnecting a refrigerant connection, remove dirt or oil at and near the connection. Cap or plug both sides of the connection.
2. Keep tools clean and dry.
3. When adding 525 viscosity refrigerant oil (refer to ADDING OIL in the Discharging, Evacuating, Adding Oil And Charging And Discharging The System.)
   • Cap or tape any line open to atmosphere to prevent dirt and moisture from entering the system.
   • Use proper wrenches when making connections on seal (o-ring) fittings. Use two wrenches to prevent distorting the lines or components.
   • When connecting the flexible hose connections, hold the swaged fitting, the flare nut and the coupling at the same time using three different wrenches to prevent turning the fitting and damaging the ground seat.
   • Use seals (o-rings) in good condition. A burr or piece of dirt may cause a leak.
   • Replace the seal when a connection has been broken. When replacing the seal first dip it in clean 525 viscosity refrigeration oil.
   • When making steel to aluminum connections, use the torque for aluminum tubing. (Refer to figure 11).
4. Have everything ready before opening a line. Do not leave the A/C system open longer than necessary.
5. After opening, evacuate before recharging with Refrigerant-12 according to the “Discharging, Evacuating, Adding Oil, Charging And Discharging The System.”
6. Service parts are dehydrated and seated before shipping. Open just before making connections. Keep at room temperature before uncapping (this prevents moisture from entering the system). If the connections are not made, reseal the parts.
L. "HPV" - High pressure vapor leaving compressor.
M. "HPL" - Vapor is cooled down by condenser air flow and leaves as high pressure liquid.
N. "LPL" - Orifice meters the liquid R-12 into evaporator, reducing its pressure and warm blower air across evaporator core causes boiling off of liquid into vapor.
O. "LPV" - Leaves evaporator as low pressure vapor and returns with the small amount of . . .
P. "LPV/lpi" - Low pressure liquid that didn't boil off completely back to the compressor to be compressed again.

<td>The table below indicates the pressure of Refrigerant - 12 at various temperatures. For instance, a drum of Refrigerant at a temperature of 26.6°C (80°F) will have a pressure of 579.9 kPa (84.1 psi). If it is heated to 51.6°C (125°F), the pressure will increase to 1154.9 kPa (167.5 psi). It also can be used conversely to determine the temperature at which Refrigerant - 12 boils under various pressures. For example, at a pressure of 207.5 kPa (30.1 psi), Refrigerant - 12 boils at 0°C (32°F).</td>

### REFRIGERANT SYSTEM DIAGNOSIS

**NOTICE:** When performing air conditioning diagnosis on vehicles equipped with a catalytic converter, warm the engine to a normal operating temperature before attempting to idle the engine for periods greater than five minutes.

---

### INSUFFICIENT COOLING

**"QUICK-CHECK" PROCEDURE**

Use the following "Hand-Feel" procedure if the system has the proper charge of Refrigerant-12 (providing ambient temperature is above 21°C (70°F)).

1. Engine must be warm and at normal idle speed.
2. Hood and body doors open.
3. Selector (mode) lever set at NORM.
4. Temperature lever at COLD.
5. Blower on HI.
6. "Hand-Feel" the temperature of the evaporator inlet pipe after the orifice and accumulator with the compressor engaged.
   - **BOTH THE SAME TEMPERATURE AND SOME DEGREE COOLER THAN AMBIENT** — Proper condition: check for other problems (refer to A/C System Diagnostic Procedure).
   - **INLET PIPE COOLER THAN ACCUMULATOR SURFACE** indicates a low refrigerant charge.
     - Add amounts 0.113 kg (4 oz.) of refrigerant UNTIL BOTH feel the same temperature. Allow stabilization time between additions.
     - Then add 0.397 kg (.88 lbs.) one can additional refrigerant. The 0.397 kg/14 oz. disposable can of Refrigerant-12 is the equivalent to .88 lbs.

---

### SYSTEM PERFORMANCE TEST

**Tool Required:**
- J-21213-A Four Jack-Dual Range Temperature Tester

1. Open doors or windows.
2. Position the right lever in the "NORM" mode.
3. Place the left lever in the cold (blue) position.
4. Place the blower switch at "HI."
5. Install J-21213-A at the instrument panel right outlet.
7. After one minute, the minimum drop in temperature from the center outlet should be:

<table>

### TESTING THE REFRIGERANT SYSTEM

If a malfunction is suspected due to abnormal system pressures, check the following:

1. Outer radiator and condenser cores for plugging. Check between the condenser and radiator.
2. Restrictions or kinks in evaporator core or condenser core, hoses, tubes, etc.
3. Refrigerant leaks.
4. Air ducts for leaks or restrictions. Air restriction may indicate a plugged (or partially plugged) evaporator core.
5. Compressor clutch slippage.
6. Improper drive belt tension.
INSUFFICIENT COOLING — A/C SYSTEMS WITH CYCLING CLUTCH — EXPANSION TUBE (PRESSURE SENSING)

MOVE THE TEMP. LEVER RAPIDLY BACK AND FORTH FROM HOT TO COLD. LISTEN FOR THE DOOR HITTING AT EACH END.

**LEAK TESTING THE REFRIGERANT SYSTEM**

**J-29547—AUTOBALANCE REFRIGERANT LEAK DETECTOR**

Electronic circuitry detects refrigerant or halogen gas leaks as small as \(\frac{1}{2}\) oz. per year. J-29547 features a slide-type on-off switch that also resets the unit in contaminated areas.

Audible and visual leak detection is provided by a change in signal tone and flashing LED built into the 45.7 cm (18-inch) flexible probe. A 102 cm (40-inch) coiled extension permits detection in hard to reach places.

A green LED battery life monitor glows to indicate sufficient operating voltage when the unit is on. Field service is possible with replacement tips, filters and a sensing element which can be cleaned with common solvent.

**PRESSURE SENSING SWITCH**

A pressure sensing switch located near the top of the accumulator, cycles the compressor clutch on R/V and G series systems. The switch also shuts off the compressor clutch when there is a low refrigerant charge.

The A/C system does not have to be discharged to replace the switch. The pressure switch fitting is equipped with a schrader-type valve.

When replacing the switch, use a new oiled seal (o-ring), and torque to 10 N·m (90 in. lbs.).

Refer to the following trouble shooting charts:
1. Insufficient Cooling Diagnosis (figures 12, 13, 14, and 15).
2. Compressor Diagnosis (figure 16).
Figure 13—Insufficient Cooling Diagnosis — Chart A
Figure 14—Insufficient Cooling Diagnosis — Chart B
Figure 15—Insufficient Cooling Diagnosis — Chart C
Figure 16—Compressor Diagnosis
ELECTRICAL/VACUUM TROUBLE DIAGNOSIS

When diagnosing problems in the electrical and vacuum systems, refer to "System Operation" and "Functional Test." For electrical wiring and vacuum diagrams, refer to figures 17, 18, 19, and 20.

Ports on rotary vacuum valves are illustrated to provide simplicity in following vacuum schematic lines but are numbered in consecutive order on the actual valve.

OPERATIONAL TEST

To determine if the electrical, vacuum and refrigeration systems are operating efficiently, do the following:

1. Operate the blower at four speeds and check the compressor clutch engagement. This indicates that the electrical circuits are working.
2. Check the hand felt temperature of the evaporator inlet pipe and accumulator surface. The same temperature indicates a properly charged system.
3. Operate the A/C control selector (mode) lever to distribute air from the outlets. This will check the vacuum and diaphragm function.

VACUUM SYSTEM DIAGNOSIS

R/V AND G SERIES

Start the engine and allow it to idle. Move the selector lever to each position and refer to the vacuum diagrams and operational charts for airflow, air door functioning and vacuum circuits. If airflow is not out of the proper outlet at each selector lever position do the following:

Inspect

1. The hose connections at the vacuum actuators, control head valve and vacuum tank.
2. The vacuum source circuit:
   • Install a vacuum tee and gage (with restrictor) at the vacuum tank outlet. Idle the engine and read the vacuum (a normal vacuum is equivalent to manifold vacuum) at all selector lever positions.
   • Vacuum less than normal at all positions. Remove the tee and connect the vacuum gage line to the tank - read the vacuum. If still low, then the problem lies in the feed circuit, the feed circuit to the tank or in the tank itself. If vacuum is now normal, then the problem lies downstream.
   • Vacuum less than normal at some positions. If vacuum was low at one or several of the selector lever positions, a leak is indicated in these circuits.

3. Specific vacuum circuit check:
   • Place the selector lever in the malfunctioning position and check for vacuum at the pertinent vacuum actuators.
   • If vacuum exists at the actuator but the door does not move, then the actuator is defective or the door is jammed.
   • If low or no vacuum exits at the actuator determine whether the cause is the vacuum harness or the vacuum valve.
   • Check the vacuum harness first.
4. Vacuum harness circuit check:
   • Disconnect the vacuum harness at the control head.

EVACUATING AND CHARGING PROCEDURES

EVACUATION AND CHARGING PROCEDURES

Before opening any refrigerant hose or component, read the information furnished in:

• Refrigerant-12 Operating Characteristics.
• Discharging, Evacuating, Adding Oil and Charging.

Remove sealing caps from subassemblies before making connections for final assembly. Use a small amount of clean 525 viscosity refrigerant oil on all tube and hose joints.

Use new seal (o-ring) dipped in the clean 525 viscosity refrigerant oil when assembling joints. The oil will aid in assembly and help provide a leak-proof joint.

When tightening joints, use a second wrench to hold the stationary part of the connection.

Tighten all tubing connections (figure 11). Insufficient or excessive torque can cause loose joints or deformed joint parts. Either condition can cause leakage.

DISCHARGING, EVACUATING, ADDING OIL AND CHARGING PROCEDURES

Discharge, evacuate and charge using J-23500-01 air conditioning service Charging Station or the J-5725-04 Manifold Gage Set, and 0.397 kg. (14 oz.) disposable cans of Refrigerant-12 (figures 21 and 22).

Use gage adapters to connect the charging lines from the charging station or manifold and gage set to system service fittings. A straight gage Adapter J-5420 and a 90° angle gage Adapter J-9459 is available.

Wear goggles and wrap a clean cloth around fittings and connections.

• Discharge the system before removing and replacing refrigeration lines or components.
• Use the service valve and pressure gage sets during evacuation and charging procedures.
• Do not charge while the compressor system is hot.
• Always discharge the system at the low side service fitting and perform the evacuation and charging procedure through the low side service fitting.
• Do not connect the high pressure line or any line to the high side service fitting during discharging and charging procedures.

CAUTION: Never remove a gage line from its adapter when the line is connected to the A/C system. Always remove the line adapter from the service fitting to disconnect a line. Do not remove charging hose at gage set while attached to service low side fitting. This will discharge the system due to the depressed schrader valve in service low side fitting and may cause personal injury due to escaping Refrigerant-12.
Before replacing any component, discharge the system.

1. Discharge at the low side service fitting.

2. With the ignition turned OFF, remove the protective cap from LOW SIDE service fitting and connect Charging Station J-23500-01 Gage Set. (Refer to figure 21).
   a. If charging station J-23500-01 is not being used, discharge the system by slowly connecting a gage hose to the low side service fitting on the accumulator and discharge into a bottle (figure 23).
   b. As the hose is SLOWLY tightened down onto the schrader valve, Refrigerant-12 will discharge from the system into the container. If no discharge occurs, check for missing or defective schrader depressor in the hose fitting.

3. With the low side of the system discharged, check the high side system fitting (on the liquid line or muffler) for remaining pressure.

4. If pressure is found, attempt to discharge the high side using the same procedure as used for the low side. (This condition indicates a restriction on the high side. Diagnose and correct before evacuating and charging).

5. After discharging, (no vapor escaping with the hose fully-tightened down), measure and record the amount. If 0.0014 kg. (.05 ounce) or more, add this amount of new 525 viscosity refrigerant oil plus any quantity in removed parts before evacuation and charging with Refrigerant-12 (refer to CCOT Refrigerant Oil Distribution for the quantity of oil normally retained in removed parts).

6. If adding oil is necessary, remove the suction hose at the accumulator outlet pipe connection and pour the correct quantity of refrigerant oil into the hose or pipe and then reconnect the hose or pipe. (Refer to step number 4 and Refrigerant Oil Distribution for specific quantity instructions).

**REFRIGERANT OIL DISTRIBUTION**

- **A-6 COMPRESSOR**—0.284 kg. (10 ounces) of 525 viscosity refrigerant oil.
- **R-4 COMPRESSOR** 0.170 kg. (6 ounces). Add new oil during the following component replacement and conditions:
  1. With no excessive oil leakage, add;
     - Compressor - Remove, drain oil, measure replace the same amount of new oil plus 0.0284 kg. (1 ounce).
     - Evaporator - Add 0.085 kg. (3 ounces).
     - Condenser - Add 0.0284 kg. (1 ounce).
     - Accumulator - R-4 Compressor - Remove drain oil, measure, replace the same amount of new oil plus 0.057 kg. (2 ounces) to compensate for that retained by the original accumulator desiccant.
     - DA-6 Compressor - Remove, drain oil, measure, replace same amount of new oil plus 0.085 kg. (3 ounces) to compensate for that retained by the original accumulator desiccant. If no oil can be drained from old accumulator, add 0.057 kg. (2 ounces) new oil to the new accumulator.
  2. With signs of excessive oil leakage;
     **A-6 COMPRESSOR** Remove Compressor and Accumulator. Drain measure and record total oil from both components. Use new oil.
     - If less than 0.170 kg. (6 ounces), add 180 ml (6 ounces) of new oil to system.
     - If more than 0.170 kg. (6 ounces), add the same amount of new oil as drained.
     - If a new accumulator is installed to A-6 system, add 0.057 kg. (2 ounces) additional oil to compensate for that held/absorbed by the original accumulator desiccant.
     **DA-6 COMPRESSOR**
     Remove the accumulator. Drain, measure and record quantity of oil in accumulator. It is not necessary to remove and drain the DA-6 compressor because the compressor only retains a minimum quantity of oil, it doesn’t have an oil sump area.
     - If less than 0.085 kg. (3 ounces) add 0.085 kg. (3 ounces) of new oil to the system.
     - If more than 0.085 kg. (3 ounces) add the same amount of new oil as drained.
Figure 22—Charging the System with a Disposable Can or Drum

- If a new accumulator is installed add 0.085 kg. (3 ounces) additional oil to compensate for that absorbed by the original accumulator desiccant.

**R-4 COMPRESSOR**

Remove the accumulator. Drain, measure and record quantity of oil in accumulator. It is not necessary to remove and drain the R-4 compressor because the compressor only retains a minimum quantity of oil.

- If less than 0.085 kg. (3 ounces), add 0.085 kg. (3 ounces) of new oil to system.
- If more than 0.085 kg. (3 ounces), add the same amount of new oil as drained.
- If a new accumulator is installed to system, add 0.057 (2 ounces) additional oil to compensate for that retained by the original accumulator desiccant.

Figure 23—Discharging without Charging Station J-23500-01

**EVACUATING AND CHARGING**

Before charging, evacuate the system if Refrigerant-12 is lost or if the system has been opened.

Evacuation and charging is a combined procedure. Purge all gage lines with Refrigerant-12 before charging.

There are three standard Refrigerant-12 evacuate and charge procedures:

- J-23500-01 Charging Station Method
- Disposable Can Method
- Drum Method

**NOTICE:** Do not use alcohol to remove moisture from the system. Alcohol can damage components.
GAGE CALIBRATION
Before evacuation, check the low pressure gage for proper calibration and vacuum system for proper operation. With the gage disconnected from the refrigeration system, be sure that the pointer indicates to the center of "0." Tap the gage to be sure the pointer is not sticking. If necessary, calibrate as follows:
• Remove the cover from the gage.
• Holding the gage pointer adjusting screw with one hand, carefully force the pointer in the proper direction to position the pointer at the "0" position. Tap the gage to be sure the pointer is not sticking. Replace the gage cover.

VACUUM SYSTEM CHECK
Before connecting the vacuum pump to the A/C system run the pump connected to the low pressure gage to determine the vacuum pump capability. If the vacuum system is unable to reach 711.2 - 736.6 mm (28 to 29 inches) or more vacuum check for leaks. If no leaks are found check the vacuum pump.

CHARGING STATION METHOD
Follow the J-23500-01 Charging Station instructions. Use with the following exceptions:
1. Do not connect the high pressure line to the air conditioning system.
2. Keep the high pressure valve on the charging station closed.
3. Perform the evacuate and charge procedure through the accumulator low side pressure service fitting.
4. Following these procedures will prevent high side pressure from damaging the charging station if an error is made during the sequence.

DISPOSABLE CAN OR MULTI-CAN METHOD
Tools Required:
J-6271-01 Single Can Refrigerant Dispensing Valve
J-6272-02 Four Can Refrigerant Dispensing Valve
1. Use tool J-6271-01 for single can or multi-can dispensing unit.
2. Use tool J-6272-02 multi-can open valve. When using disposable cans, close the tapping valve and then attach the can(s) following the instructions included with the tapping valve or tapping manifold adapter.

REFRIGERANT DRUM METHOD
Tool required:
J-23390 Refrigerant Dispensing Valve
1. Use tool J-23390 for a 5.443 kg (12 lb.) can. A 13.608 kg (30 lb.) can has a built in opener-valve. Place the drum on a scale and note weight before charging. During charging, watch the scale to determine the amount used.
CAUTION: Never remove a gage line from its adapter when the line is connected to the A/C system. Always remove the line adapter from the service fitting to disconnect a line. Do NOT remove the charging hose at the gage set while it is attached to the accumulator. This will discharge the system because of the depressed schrader valve in service low side fitting. Also, the escaping Refrigerant-12 may cause personal injury.

6. Replace the protective cap on the accumulator fitting.
7. Turn the engine off.
8. Leak the check system with a J-6084 Leak Detector.
9. Start the engine.
10. With the system charged and leak-checked, operate the system and test for pressures as outlined under Relative Humidity, Temperature and Pressure Relationship of Refrigerant-12 (figure 10).

ACCUMULATOR ASSEMBLY

The accumulator assembly has a service replacement which includes two seals (o-rings for the inlet and outlet connections). The desiccant is NOT serviced separately - it is part of the sealed accumulator assembly. Refer to CCOT Refrigerant Oil and Distribution for presence of refrigerant oil and service conditions when removing the accumulator from the vehicle to measure the oil.

Replace the accumulator assembly when:
1. A physical perforation produces a leak.
2. The (orifice) screen experiences continued or repeated plugging.
3. An evaporator fails because of inside-out internal corrosion.
   DO NOT REPLACE the accumulator assembly where:
1. A dent is found in the outer shell of the accumulator.
2. A vehicle is involved in a collision and there is no perforation to the accumulator. Cap or place a plastic bag around an open refrigerant line.

SPECIFIC COMPONENT DIAGNOSIS

COMPRESSOR

Compressor defects can appear as noise, seizures, leakage or low discharge pressures.

NOTICE: Resonant compressor noises are normal; however, irregular noise or rattles may indicate broken parts or wear. To check seizure, de-energize the magnetic clutch and rotate the drive plate. If rotation is impossible the compressor is seized.

To check for a leak, refer to "Leak Testing The Refrigerant System." A faulty internal seal, a restriction or an insufficient refrigerant charge can cause a low discharge pressure. Check before servicing.

CONDENSER

A condenser may leak or be restricted. A restriction will cause excessive compressor discharge pressure. If a partial restriction is present, ice or frost will form after the restriction as the refrigerant expands after passing through the restriction.

Air flow restrictions through the condenser or radiator can cause high discharge pressures. During normal condenser operation, the outlet pipe will be cooler than the inlet pipe.

EXPANSION VALVE

There are five expansion valve malfunctions: valve stuck open, valve stuck closed, broken power element, a restricted screen or an improperly located or installed power element bulb. To correct the first three conditions, replace the valve; to correct the last two, replace the valve inlet screen and properly install a power element bulb.

Operating the system will indicate valve trouble.

1. Valve stuck open.
   — Noisy compressor.
   — No cooling - freeze up.
2. Valve stuck closed, broken power element or plugged screen.
   — Very low suction pressure.
   — No cooling.
3. Poorly located power element bulb.
   — Normal pressure.
   — Poor cooling.

DIAGNOSIS FOR MALFUNCTIONING VALVE

Use the following procedure to determine a malfunctioning valve.

1. Operate the system at normal idle. If the valve is malfunctioning, the low pressure readings (evaporator pressure) will be above specifications (figure 10).
2. The loss of system performance is not as evident when the compressor head pressure is below 1379 kPa (200 psi). Increase the system head pressure by partially blocking the condenser. Disconnect the blower lead wire and operate the system to determine if the evaporator pressure can be obtained.

EVAPORATOR

An inadequate supply of cool air can cause the evaporator to malfunction. Check for a plugged core, a cracked case or a leaking seal.
REFRIGERANT LINE RESTRICTIONS

There are three refrigerant line restrictions:
1. Suction Line - A restriction will cause low suction pressure at the compressor, low discharge pressure and little or no cooling.
2. Discharge Line - A restriction will cause the pressure relief valve to open.
3. Liquid Line - A restriction will be caused by low discharge and suction pressure, and insufficient cooling.

REFRIGERANT-11 FLUSHING PROCEDURE

Tool Required:
J-33883 Air Conditioning Flushing Kit

Flush the system when:
1. A compressor has failed resulting in debris in the air conditioning system refrigerant components or oil.
2. Inspection of the orifice tube shows the inlet screen to be 25% or more coated with debris.
3. Refrigerant oil is overcharged or contaminated.

Follow the kit's instructions and flush each component separately allowing the Refrigerant-11 to soak in each component for five minutes.

Flushing the system requires approximately 6.804 kg (15 lbs.) of R-11 and 1.814 (4 lbs.) of R-12 and up to 0.312 kg (11 oz.) of 525 viscosity refrigerant oil. The actual quantities of R-11, R-12 and oil depends on the system, the number of components flushed and the amount of debris in each component.

Remove Refrigerant-11 by purging each components with Refrigerant-12 followed by a system evacuation. Refer to “On-Vehicle Service” for removal procedures for the system’s components. Cap or plug all open connections when removing the components.

Remove or Disconnect (Figure 24)
1. Battery ground cable.
2. Refrigerant from the system.
3. Compressor.
4. Accumulator.
5. Orifice tube.
6. Evaporator.

Inspect
• Each component for wear or damage. Replace if necessary.

Clean
• Flush each component with J-38833. Follow the directions included with the kit.

Install or Connect (Figure 24)
1. Evaporator.
2. Orifice tube.
3. Accumulator.
4. Compressor.
5. Refrigerant-12 to the system.
• Evacuate, charge and test the system.
ON VEHICLE SERVICE

COMPRESSOR REPLACEMENT (R/V)

Remove or Disconnect (Figures 25, 26, 27 and 28)

1. Battery negative cable.
2. Refrigerant from the system.
3. Connector attaching bolt.
   - Cap or plug open connections.
5. Electrical lead to the clutch actuating coil.
   - Loosen the bracket and pivot bolts.
7. Compressor.
   - Drain and measure the oil.
   - Check for contamination.

Install or Connect (Figures 25, 26, 27 and 28)

1. Oil to the compressor.
   - Important
   - Replace with fresh oil. If the system was serviced, install a full, fresh charge of refrigeration oil.
2. Compressor.
   - Position to the mounting bracket.
3. Nuts, bolts and spring washer.
4. Connector assembly to the rear of the compressor.
   - Important
   - Use new seals (o-rings) coated with clean refrigeration oil.
5. Electrical lead to the coil.
6. Compressor belt.
7. Battery negative cable.

COMPRESSOR REPLACEMENT (G)

Remove or Disconnect (Figures 29, 30 and 31)

1. Battery ground cable.
2. Compressor clutch connector.
3. Refrigerant from the system.
4. Belt.
   - Loosen the three bolts that hold the idler pulley to the air conditioning support bracket. Refer to ENGINE COOLING (SEC. 6B1).
   - Back off the idler pulley adjustment screw.
5. Engine cover.
6. Air cleaner.
7. Fitting and muffler assembly.
   - Cap or plug all open connections.
8. Compressor bracket.
9. Engine oil tube support bracket bolt and nut.
10. Clutch ground lead.
11. Compressor.

Important

- Drain and measure the oil. Check for contamination.

Install or Connect (Figures 29, 30, and 31)

1. Oil to the compressor.

Important

- Replace with fresh oil. If the system was serviced, install a full, fresh charge of refrigeration oil.
2. Compressor.
   - Position to the mounting bracket.
3. Nuts, bolts and spring washer.
4. Connector assembly to the rear of the compressor.

Adjust

- Tighten the idler pulley adjustment screw. Measure the belt tension with J-23600-B. Refer to ENGINE COOLING (SEC. 6B1).
- Tighten the three bolts that hold the idler pulley bracket to the air conditioning compressor support bracket.

Tighten

- Bolts to 33 N·m (24 ft. lbs.).
- Recheck the belt tension with J-23600-B. Refer to ENGINE COOLING (SEC. 6B1).

7. Battery ground cable.
8. Refrigerant to the system.
   - Evacuate, charge and leak test.

CONDENSER REPLACEMENT

Remove or Disconnect (Figures 32 and 33)

1. Battery ground cable.
2. Refrigerant from the system.
4. Radiator grille center support.
5. Left grille support to upper fender support (2) screws.
6. Condenser inlet and outlet lines, and the outlet tube at the right end of the condenser (figure 32).

Important
- Cap or plug all open connections.
7. Condenser to radiator support screws (figure 33).
8. Bend the left grille support outboard to gain clearance for condenser removal.

Install or Connect (Figures 32 and 33)

1. New condenser.

Important
- Add 30 ml (1 ounce) of clean refrigeration oil to a new condenser.

2. Left grille support.
3. Radiator support screws.
4. Condenser inlet and outlet lines.

Important
- Use new seals (o-rings) coated with clear refrigeration when connecting refrigerant lines.

9. Condenser assembly by pulling it forward and then lowering it from the vehicle.
ACCUMULATOR REPLACEMENT

**Remove or Disconnect (Figures 32 and 34)**
1. Battery ground cable.
2. Compressor clutch connector.
3. Refrigerant from the system.

**Important**
- Cap or plug open connections.
- Drain excess refrigerant oil into a clean container. Measure and add new oil.

**Install or Connect (Figures 32 and 34)**
1. New accumulator.

**Important**
- Add 0.028 kg. (one ounce) of clean refrigerant oil. PLUS an amount equal to that drained.

BLOWER ASSEMBLY REPLACEMENT

**Remove or Disconnect (Figures 32, 34 and 35)**
1. Battery ground cable.
2. Insulator - Diesel Engine (figure 35).
3. Blower motor lead and ground wires (134).

**Figure 34—Evaporator and Blower Assembly**
5. Blower assembly.
   • Case attaching screws.
   • Carefully pry the blower flange away from the case if the sealer acts as an adhesive.
6. Blower wheel from motor shaft.
   • Remove shaft nut.

Install or Connect (Figures 32, 34 and 35)
1. Blower wheel to the motor shaft.
2. Blower assembly.
   • Use a new bead of sealer on the flange.
5. Blower motor lead and ground wires.
6. Battery ground cable.

EVAPORATOR CORE REPLACEMENT

Remove or Disconnect (Figures 32 and 34)
1. Battery ground cable.
2. Discharge the system.
3. Nuts from the selector duct studs projecting through the dash panel.
4. Evaporator case cover (122).
5. Inlet and outlet lines.
   • Cap or inlet open connections.
7. Evaporator core assembly.

Install or Connect (Figures 32 and 34)
1. New core.
   • Add 90 ml (3 ounces) of clean refrigeration oil.
2. Expansion tube.
3. Inlet and outlet lines.
   • Use new seals (o-rings) coated with clean refrigeration oil.
4. Bead of sealer to cover.
   • Remove old sealer before applying new bead of sealer.
5. Evaporator case cover.
6. Nuts to the studs that project into the dash panel.
7. Battery ground cable.
8. Evacuate, charge and check the system.

ORIFICE (EXPANSION TUBE) REPLACEMENT

The expansion tube is located in the evaporator core inlet line.

Remove or Disconnect (Figure 32)
1. Discharge the system.
2. Condenser to the evaporator line at the evaporator inlet (figure 35.)
   • Cap or plug the open line.
3. Expansion tube from the evaporator core inlet line.
   • Use needle-nose pliers to remove the core.
4. Expansion tube seal (o-ring) from the core inlet line.

Install or Connect (Figures 4 and 35)
1. Expansion tube seal (o-ring) to the core inlet line.
   • Use new seal (o-ring) coated with clean refrigeration oil.
   • Insert the short screen and end of the orifice into the evaporator inlet line.
2. Expansion tube to the evaporator core inlet line.
3. Condenser to the evaporator line at the evaporator inlet.
4. Evacuate, charge and check the system.

SELECTOR DUCT AND HEATER CORE REPLACEMENT

Remove or Disconnect (Figures 36 and 37)
1. Battery ground cable.
2. Drain the radiator.
3. Heater hoses from the core tubes (148) (figure 36).
   • Plug the core tubes to prevent spillage.
4. Instrument panel compartment and door.
5. Center duct to the selector duct (200) (figure 37).
6. Center lower and center upper ducts.
7. Temperature door cable.
8. Nuts from the three selector duct studs that project into the dash panel.
9. Selector duct to dash panel screw (inside the vehicle).
10. Selector duct assembly.
    • Pull rearward until the core tubes clear the dash panel.
    • Lower the selector assembly to reach the vacuum and electrical harness.

CONTROL ASSEMBLY REPLACEMENT

Remove or Disconnect (Figure 40)
1. Battery ground cable.
2. Radio. Refer to RADIO (SEC. 9A).
3. Instrument panel bezel.
4. Control from the dash.

- Lower the control to gain access to the control assembly.

Important
- Do not kink the cable.
5. Cable (236) (figure 40).
7. Electrical harness.
8. Control.

Install or Connect (Figure 40)
1. Blower switch to the new control.
2. Electrical harness.
3. Vacuum harness.
4. Cable (236).
5. Control to the dash.
8. Battery ground cable.
Adjust (Figure 41)
1. Remove instrument panel compartment and door.
2. Loosen the cable attaching screw at the selector duct assembly.
   • Make sure the cable is installed in the bracket on the selector duct assembly.
3. Place the temperature lever in full COLD position and hold while tightening the cable attaching screw.
4. Install instrument panel compartment and door.

**BLOWER SWITCH REPLACEMENT**

The blower switch is located on the rear of the control assembly.

++ Remove or Disconnect (Figure 40)
1. Battery ground cable.
2. Instrument panel bezel.
3. Control to instrument panel screws.
   • Set the control on top of the radio.

VACUUM TANK REPLACEMENT

The vacuum tank is mounted to the cowl behind the left front fender.

**Remove or Disconnect (Figures 42, 43 and 44)**
1. Vacuum lines at the tank.
2. Tank to dash panel screws.
3. Tank (251).

**Install or Connect (Figures 42, 43 and 44)**
1. Tank (251).
2. Vacuum hoses.

BLOWER MOTOR RESISTOR REPLACEMENT

The blower motor resistor is located in the blower side of the blower-evaporator case.

**Remove or Disconnect (Figure 32)**
1. Wiring harness at the resistor.
2. Resistor to case attaching screws.
3. Resistor (81).

**Install or Connect (Figure 32)**
1. Resistor (81).

FUSE REPLACEMENT

A 25-amp fuse, located in the junction block, projects the system except for the blower circuit. The fuse for the blower circuit is located in the electrical wiring between the junction block and the blower relay.

VACUUM LINE REPLACEMENT—ENGINE COMPARTMENT

Rubber vacuum hoses can be repaired by cutting the hose at a leak, inserting a connector and pushing the hoses onto the connector.

If the entire hose needs replacing, pull the hose from each connector and thread a new hose into place. Follow the routing of the original hose.

For vacuum line routing, refer to figures 42, 43 and 44.

1. 4.3L engine (figure 42).
2. 5.0L, 5.7L and 7.4L engines (figure 43).
3. 6.2L engine (figure 44).

VACUUM LINE REPLACEMENT—DASH

These lines are molded to a connector which is attached to a vacuum control switch on the control assembly.

Repair a leaking vacuum hose by cutting the hose at the leak, inserting a connector and pushing the hoses onto the connector.

If an entire hose needs replacing, cut the hose off at the connector and attach the hose to the control assembly vacuum switch.

To find the dash vacuum harness and actuator installation, refer to figure 45.

REFRIGERANT-12 HOSE REPLACEMENT

Refrigerant hoses are replaced as a unit. The hose assembly must be removed from the compressor and the condenser.

The hose assembly has “captured” seals (o-rings) which are not replaced. New seals are installed on the new hose assembly. For installation, refer to figures 46, 47 and 48.

Remove or Disconnect (Figures 46, 47 and 48)

1. Refrigerant from the system.
2. Hose plate and bolt from the rear of the compressor (275).
3. Hose connections (97) at the condenser (70) and the accumulator (107).
   • Cap or plug all open connections.

Install or Connect (Figures 46, 47 and 48)

1. Hose connections (97) at the condenser (70).
   • Fittings to 24 N·m (18 ft. lbs.).
2. Hose connection (97) at the accumulator (107).
   • Fittings to 41 N·m (30 ft. lbs.).
3. Hose plate and bolt to the rear of the compressor (275).
   • Bolt to 34 N·m (25 ft. lbs.).
4. Refrigerant to the system.
   • Leak test.

REAR INTERIOR ROOF MOUNTED SYSTEM—SUBURBAN

The rear interior roof mounted system is used with the front air conditioning system. Refer to figures 49, 50 and 51.

REAR DUCT REPLACEMENT

This duct covers the blower-evaporator assembly located at the rear of the vehicle. It has four adjustable air outlets (figure 49).

Remove or Disconnect (Figure 49)
1. Drain tube from the rear duct.
2. Screws securing the duct to the roof panel and rear header brackets.
3. Duct (303).

1. Battery ground cable.
2. Rear duct (303).
3. Blower motor ground strap.
4. Blower motor lead wire.
5. Lower to upper blower-evaporator case screws.

**Important**
- Before removing the case screws, support the lower case to prevent damage to the case or motor assembly.
7. Motor retaining strap.
9. Wheels from the motor shaft.

**Install or Connect (Figure 50)**
1. Wheels to the motor shaft (330).
2. Place the tension springs on the wheel hubs.
3. Motor and wheels to the case.
   - Align the wheels to prevent contact with the case.
4. Motor retaining strap and foam.
5. Lower case and blower motor assembly in the vehicle (336).
6. Lower to upper case screws.
   - Turn the blower wheels to prevent rubbing against the case.
7. Center ground strap.
8. Blower lead wire.
9. Rear duct.
10. Battery ground cable.

**EXPANSION VALVE REPLACEMENT**

This system incorporates an expansion valve which does not utilize and external equalizer line.

**Remove or Disconnect (Figures 50 and 51)**
1. Battery ground cable.
2. Purge the system of refrigerant.
3. Rear duct.
5. Ground wire.
6. Refrigerant lines at the rear of the blower-evaporator assembly (351).
   - Cap or plug the open connections.
7. Blower-evaporator support to roof rail screws.
   - Place the blower-evaporator upside down on a work bench.
9. Lower case assembly.
10. Upper case from the evaporator core.
11. Expansion valve inlet and outlet lines.
   - Cap or plug open connections.
12. Expansion valve capillary bulb from the evaporator outlet line.
13. Valve.
14. Plastic pins that hold the screen to the core.
15. Screen.

**Install or Connect (Figures 50 and 51)**
1. Wire screen to the front of the core.
2. Plastic pins.
3. Expansion valve inlet and outlet lines (341).
   - Use new seals (o-rings) coated with clean refrigeration oil.
4. Sensing bulb to the evaporator outlet line (342).
   - Bulb must make good contact with the line.
   - Add 30 ml (3 ounces) of clean refrigeration oil to new core.
5. Upper case and supports to the core.
6. Lower core case and blower assembly.
7. Blower-evaporator assembly to the roof.
8. Support to roof rail screws.
9. Refrigerant lines to the blower-evaporator unit.
   - Use new seals (o-rings) with clean refrigeration oil.
10. Blower lead wire.
11. Ground wire.
12. Rear duct.
13. Battery ground cable.
14. Evacuate, charge and check the system.
BLOWER MOTOR SWITCH REPLACEMENT

The auxiliary heater and air conditioning blower switches are located to the right of the steering wheel.

Remove or Disconnect (Figure 52)
1. Battery ground cable.
2. Switch retaining screws.
3. Wiring harness.
4. Switch.

Install or Connect (Figure 52)
1. Switch.
2. Wiring harness.
3. Switch retaining screws.
4. Battery ground cable.

FUSE REPLACEMENT

A-25 amp fuse at the junction box protects this system. A 20-amp fuse, located between the junction block and the rear blower motor switch, protects the rear blower high speed circuit.

A/C SYSTEM — G SERIES

CONDENSER REPLACEMENT

Remove or Disconnect (Figure 53)
1. Battery ground cable.
2. Refrigerant from the system.
3. Grille, hood lock, and center hood lock support.
4. Condenser inlet and outlet lines at the condenser (70).
5. Screws attaching the left side condenser bracket to the radiator.
6. Screws attaching the right side condenser bracket to the condenser.
7. Condenser.
8. Left bracket from the condenser.

Install or Connect (Figure 53)
1. Left bracket to condenser.
2. Condenser (70).
   • Add 30 ml (1 ounce) of clean refrigeration oil to a new condenser.
3. Screws attaching the left side of the condenser bracket to the condenser.
4. Screws attaching the right side of the condenser bracket to the condenser.
5. Condenser inlet and outlet lines at the condenser (70).
6. Grille, hood lock and center hood lock support.
7. Refrigerant.
8. Battery ground cable.
9. Evacuate, charge and test the system.

ACCUMULATOR REPLACEMENT

Remove or Disconnect (Figure 53 and 54)
1. Battery ground cable.
2. Compressor clutch cable.
3. Discharge the system.
4. Inlet and outlet lines.

Important
- Cap or plug open connections.
5. Bracket screws.
6. Accumulator.

Important
- Drain excess refrigerant oil into a clean container. Measure and record amount. Use fresh oil.

Install or Connect (Figure 53 and 54)
1. New accumulator.

Important
- Add 30 ml (1 ounce) of clean refrigerant oil PLUS an amount equal to that drained.
2. Bracket screws.
3. Inlet and outlet lines.
4. Compressor clutch connector.
5. Battery ground cable.
6. Evacuate, charge and check the system.
HEATER CORE REPLACEMENT

- - - Remove or Disconnect (Figure 54)
1. Battery ground cable.
2. Engine cover.
3. Steering column to instrument panel.
   - Lower column.
4. Upper and lower instrument panel attaching screws and radio support bracket attaching screw.
5. Raise and support right side of the instrument panel.
6. Right lower instrument panel support bracket.
7. Recirculating air door vacuum actuator.
8. Temperature cable and vacuum hoses at the distributor case.
9. Heater distributor duct.
10. Defroster duct to dash panel attaching screws (below the windshield).

**ORIFICE (EXPANSION TUBE) REPLACEMENT**

The orifice tube is located in the evaporator core inlet line.

**Remove or Disconnect (Figure 53)**

1. Discharge the system.
2. Condenser to the evaporator line at the evaporator inlet.
   - Cap or plug the open line.
3. Expansion tube from the evaporator core inlet line.
   - Use a needle nose pliers to remove the orifice from the tube.
4. Expansion tube seal (o-ring) from the core inlet line.

**Install or Connect (Figure 53)**

1. Expansion tube seal (o-ring) to the core inlet line.
   - Use a new seal (o-ring) coated with clean refrigeration oil.
   - Insert the short screen end of the orifice into the evaporator inlet line.
2. Expansion tube to the evaporator core inlet line.
3. Condenser to the evaporator line at the evaporator inlet.
4. Evacuate, charge and check the system.

**BLOWER MOTOR INSULATION (W/DIESEL) REPLACEMENT**

The 6.2 Liter Diesel Engine has extra insulation around the blower motor on vehicles without air conditioning and around the blower motor and evaporator core with air conditioning option (figure 55).

**Remove or Disconnect (Figure 2 54 and 55)**

1. Parking lamp assembly.
2. Radiator overflow tank.
   - Insulation through the hood opening.
4. Blower motor (482).

**Install or Connect (Figures 54 and 55)**

1. Blower motor (482).
2. Insulation (481).

8. Evaporator inlet line.
9. Three (3) nuts and one (1) screw attaching module to the dash panel.
10. Core case assembly from the vehicle.
11. Screws and separate the case sections.
12. Evaporator core.

**Install or Connect (Figure 54)**

1. New core.
   - Add 90 ml (3 ounces) or 525 viscosity refrigeration oil to a new condenser.
2. Screws and the case sections.
3. Core case assembly to the vehicle.
4. Module to the dash panel.
5. Evaporator inlet line.
6. Accumulator inlet and outlet lines.
7. Two brackets that hold the accumulator to the case.

**BLOWER MOTOR REPLACEMENT**

**Remove or Disconnect (Figure 54)**

1. Battery ground cable.
2. Coolant recovery tank.
3. Power antenna.

4. Blower motor lead wire.
5. Motor and wheel assembly (433).
   - Five blower motor mounting screws.
   - Pry gently on the blower flange if the sealer acts as an adhesive.
6. Blower wheel to motor shaft nut.
7. Separate the wheel and motor assemblies.

**Install or Connect (Figure 54)**

1. Wheel to the blower motor.
   - Assemble the blower wheel to the motor with the open end of the wheel away from the blower motor.
2. Blower wheel to the motor shaft nut.
3. Blower wheel and motor assembly to the vehicle.
   - If the motor mounting flange sealer has hardened or is not intact, remove the old sealer and apply a bead of sealer to the mounting flange.
   - Check blower operations: blower wheel should rotate with no interference.
4. Blower motor lead wire.
5. Coolant recovery tank and power antenna.
6. Battery ground cable.
CONTROL ASSEMBLY REPLACEMENT

Remove or Disconnect (Figures 56, 57, 58 and 59)
1. Battery ground cable.
2. Headlamp switch control knob.
3. Instrument panel bezel.
4. Control (491) (figure 56).
   • Screws.
   • Temperature cable eyelet clip and retainer (499) (figure 57).
   • Control lower right mounting tab through dash opening.
   • Upper tab.
5. Electrical harness (502) (figure 58).
7. Control assembly.

Install or Connect (Figures 56, 57, 58 and 59)
1. Electrical and vacuum connection to the control.
2. Control into the opening in the dash panel.
3. Temperature cable.

Adjust
• Temperature door operation. Refer to "Temperature Door Cable Adjustment."
4. Instrument panel bezel.
5. Headlamp switch control knob.
6. Battery ground cable.

TEMPERATURE DOOR CABLE ADJUSTMENT

Adjust (Figure 56)
1. Remove instrument panel compartment and door.
2. Loosen the cable attaching screw at the selector duct assembly.
   • Make sure the cable is installed in the bracket on the selector duct assembly.
3. Place the temperature lever in full HOT position and hold while tightening the cable attaching screw.
4. Install instrument panel compartment and door.

**DEFROSTER DUCT REPLACEMENT**

To remove the defroster duct mounting, refer to figure 62.

**TEMPERATURE DOOR CABLE REPLACEMENT**

To remove the temperature door cable refer to “Control Assembly Replacement” and figure 57.

**VACUUM TANK REPLACEMENT**

Remove or Disconnect (Figures 63, 64 and 65)

1. Raise the hood.
2. Vacuum harness at the tank (552).
3. Tank attaching screws.
4. Tank (551).

Install or Connect (Figures 63, 64 and 65)

1. Tank (551).
2. Vacuum harness.
3. Lower the hood.

**VACUUM LINES — ENGINE COMPARTMENT**

For vacuum line assemblies, refer to figures:

**R/V AND P MODEL FRAMES**

**DESCRIPTION**

The models covered under this part of the section include R/V, and P. The service information for the G model will be found in the underbody portion of this section.

Proper frame alignment is important to assure normal life and functioning of many other parts of the vehicle. If the vehicle has been involved in a fire, collision, or has been overloaded, there is cause to check the frame alignment. If, for any other reason, alignment is suspected it should be checked. A procedure for this is described later in this section under "Checking Frame Alignment."

It is possible that certain conditions make the frame appear to be out of alignment when, in fact, it is not. These conditions are also described under "Checking Frame Alignment."

Terms used later in this section are briefly defined below:

1. **SECTION MODULUS**—This is a measure of the strength of a frame, based on height, width, thickness and shape of the side rails. It does not account for the strength of the material used in the frame.

2. **YIELD STRENGTH**—This is a measure of the strength of the material from which the frame is made. It is the maximum load measured in kPa (psi) that can be placed on a material and still have it return to its original shape.

3. **RESISTANCE TO BENDING MOMENT (RBM)**—This is a single measure of frame strength that accounts for both the section modulus and the strength of the material used. It is the product of section modulus and yield strength.

4. **SAG**—This refers to a frame or side rail that is bent down from where it should be.

5. **BUCKLE**—This refers to a frame or side rail that is bent up from where it should be.

6. **DIAMOND**—This refers to the condition where one entire frame rail is moved forward from, or to the rear of, its correct alignment with the other rail.

7. **TWIST**—This refers to the condition where the entire frame has been twisted. One rail will basically slope up while the other rail will basically slope down.

8. **SIDESWAY**—This refers to a side rail that is bent to the side of where it should be.

9. **TRACKING**—This refers to the alignment of the vehicle axles with each other. A misaligned frame can cause improper tracking. If the vehicle is tracking correctly, all axles will be parallel to each other and perpendicular to the center line of frame.

10. **WEB**—The vertical part of a channel-type frame rail.

MINIMIZING FRAME SERVICE

Generally, frame service can be minimized or eliminated by minimizing the concentration of stress in small areas of the frame.

1. Vehicles should be used only for those purposes for which they were designed.
   - They should not be overloaded.
   - They should be loaded evenly; localized loads should be avoided.
   - Do not operate the vehicle on extremely rough terrain.
   - Take into account the forces that will be placed on a frame from the operation of equipment such as snow plows when picking a frame for a new vehicle or reinforcing a frame.

2. Follow recommended practices when repairing a frame or when mounting a body or equipment on a frame.
   - Avoid sudden changes in the section modulus.
   - Do not cut holes in the frame rail flanges.
   - Space holes in the web section of a rail at least 13 mm (1/2-inch) from one another.
   - Use existing holes whenever possible.
   - Do not drill holes with a torch.
   - Do not overload the frame rails.
   - Avoid welding on the flanges.
   - Do not allow four or more holes to exist on the same vertical line of the web.
   - Holes made in a reinforcement should be placed a distance of at least two times the material thickness from the edge of the reinforcement.

CHECKING FRAME ALIGNMENT

The main parts of a frame are the side rails and crossmembers. The rails carry the load and the crossmembers stabilize the rails.

Types of frame misalignment can be divided into five groups. The five groups are sag, buckle, diamond, sidesways, and twist. For a brief definition of these terms, refer to “Description” at the beginning of this section.

A misaligned frame rail may have moved forward from, up or down from, or to the side of where it should be. These possibilities must be checked.

The easiest way to check frame alignment is with gages made for this purpose. Detailed instructions are normally supplied with gages at the time of purchase. Therefore, instructions for gage use are not given in this manual.

It is possible to check certain portions of frame alignment without the proper gages. The procedure is described later in this section.

Whether alignment is checked with or without gages, the vehicle must be parked on a level section of floor.

Certain conditions call for preliminary checks before actually checking the frame. Suspension or axle problems may make it appear that the vehicle frame is out of alignment. If an axle has shifted, "Diamond" or "Sidesway" may appear to exist when, in fact, they do not. A weak spring may make the vehicle appear to have a twisted frame.

A visual inspection of the top and bottom flanges of each rail may reveal the specific area where sag or buckle exists. In the case of sag, wrinkles may appear on the top
of the upper flange; such wrinkles are definite evidence of sag. Wrinkles on the bottom of the lower flange are definite evidence of buckle.

DETERMINING THE FRAME CENTERLINE (Figure 1)
1. Move the vehicle to a level, well-lighted section of the floor.
2. Make a diagram of the frame on the floor beneath the vehicle as follows:
   a. Using a plumb bob, transfer points 1, 2, 11, 12 from the inside of the web to the floor. Mark the points (figure 1).
   b. Using a plumb bob, transfer the remaining points from the outside of the web to the floor. Mark the points. Be sure to use points from the same place on both the right and left frame rail.
3. Move the vehicle away from the points on the floor.
4. Measure the distance between points 1 and 2. This distance should be 704.85 mm (27.75-inch) for the standard front axle, and 847.25 mm (33.75-inch) if equipped with a 5000# I-Beam Front Axle.
5. Measure the distance between points 11 and 12. This distance should be 847.25 mm (33.75-inch). If both the measurements in steps 4 and 5 were correct, continue the procedure. If the measurements are not correct, refer to “Horizontal Check” step 2, and mark the centerline through the intersection of two sets of diagonals that have equal measurements.
6. Make a mark on the floor exactly halfway between points 1 and 2. Make a similar mark between points 11 and 12.
7. Use a chalk line to mark a line through the points. This is the centerline of the frame.

HORIZONTAL CHECK
1. Measure the distance between the frame rails, and the centerline at points 3-10. Each pair of corresponding points should be an equal distance from the centerline within 3 mm (1/8-inch). Example: Points 3 and 4 should measure equally from the centerline as should points 5 and 6, 7 and 8, and points 9 and 10.
2. Measure diagonally from point 1 to point 6, and from point 2 to point 5. Mark the floor where the diagonals pass the centerline. The diagonals should measure the same distance within 5 mm (1/16-inch), and should cross at the centerline. If the frame is within specifications, the frame within these points is properly aligned.
3. Repeat step 2 on other pairs of diagonals until the entire frame has been checked. Example: Point 3 to point 10 and point 4 to point 9 or point 5 to point 12 and point 6 to point 11, etc.
4. Refer to “Straightening Frames” to repair any damage that is found.

STRAIGHTENING FRAMES
Frame straightening can be complicated and usually requires special equipment. It should be attempted by competent personnel only.
A complete analysis of the condition of the frame should be made before any steps are taken to straighten it. Analyzing the cause of failure will help determine the correct sequence of steps in the repair. (Refer to

REPAIRING CRACKS
Two common types of cracks are shown in figure 2. The straight crack will normally start from the edge of a flange. It will go across the flange and through the web section of a rail. Finally, it will continue through the other flange. This type of crack may result from high concentrations of stress in small areas of the frame, excessive bending moment, and torsional loading. (Refer to “Minimizing Frame Service,” previously outlined in this section).
Sunburst crack(s) will radiate out from a hole in the web section of a rail or crossmember. They are caused by high loads being applied at a mounting bracket or crossmember which is not securely or properly attached to the rail.

If cracks occur to both the rail and reinforcement at a particular area of the frame, they must be repaired separately. The flanges must react independently to prevent localized stress concentration. Use a copper spacer between the flanges of cracked base rail flanges and reinforcement flanges.

Crossmember mounting flange cracks may be repaired in the same manner as side rail cracks. However, weld bead should be built up to provide a good smooth radius. If a crossmember is greatly damaged replace it.

It may be necessary to align the frame and level the rails before repairing the frame.
1. Remove any equipment that will interfere with access to the crack.
2. Locate the extreme end of the crack and drill a 6 mm (0.25-inch) hole.
3. "V" grind the entire length of the crack from the starting point to the 6 mm (0.25-inch) hole at the extreme end.
4. Open up the bottom of the crack 2 mm (¥4-inch) to allow good penetration of the weld. (A hack-saw blade may be used for this).
5. Weld with proper electrode and proper welding techniques. Refer to "Welding" outlined later in this section for tips on welding.
6. Grind the weld smooth on both the inside and the outside of the rail or crossmember. Be extremely careful to eliminate weld build-up or notches on the edge of the flange.

WELDING

Improper welding techniques are the cause of many weld and/or frame failures. The following information points out potential areas of difficulty and provides some general guidelines for successful frame welding.

Most weld failures occur at the end of the weld in areas of the frame that are under high stress. By eliminating the ends of a weld, failures can be reduced; this can be done by making a hole or slot in the part to be attached and then using a fillet weld around a slot or plug weld. Do not leave a notch at the end of a weld.

Over-welding can be harmful, especially if it is in an area of the frame that receives high concentrations of stress.

Small cracks in a crossmember may be welded. (Refer to "Repairing Cracks" previously outlined in this section).

When welding:
1. Do not use oxyacetylene welding equipment.
2. Whenever possible, use smaller diameter electrodes and make several passes; this is preferred to using a large diameter electrode and making fewer passes.
3. Do not use more heat than is necessary to give good penetration.
4. Do not run more passes than necessary.
5. Make sure the weld is free from craters and undercuts.
6. Make sure scale is removed from each successive pass.
7. If repairing a crack, grind the surface of the weld flush with the parent material.
8. When mounting accessories, do not weld across the flanges.
9. When mounting accessories, do not weld within 19 mm (¥4-inch) of a flange.
10. Do not weld up to the edge of a part being welded to a frame. Leave 6 mm (0.25-inch) between the end of the weld and the edge of the part.
11. Do not weld cast brackets to the frame.
12. Do not weld the flanges of cracked reinforcements and base rails together.
13. Connect the welding machine ground cables as close to the working area as possible.
14. Avoid direct contact between the welding cables and any part of the vehicle.
15. Do not get the welding cables near the vehicle wiring.

G MODEL UNDERBODY

DESCRIPTION

The G Model incorporates a unitized body design comprised of side rails, cross sills, and outriggers which are all part of the welded underbody.

A misaligned underbody can affect the operation of many vehicle components. It is essential that underbody alignment be exact to within 1.6 mm (¥1e-inch).

UNDERBODY ALIGNMENT

To determine the alignment of the underbody it is necessary to use a good quality traming gage. This gage must be capable of measuring all points of the underbody up to three quarters of the body length.

Following the instructions given by the manufacturer of your gage, measure the horizontal and vertical points as shown in figure 3. Compare each measurement with the specifications given in the figure to determine the damaged areas and the extend of the damage. When repairing the underbody it will be necessary to return the underbody to these original specifications within 1.6 mm (¥1e-inch).

Many different types and brands of unibody repair equipment are available; each system may be slightly different. A multiple pull system is most desirable in order to correct the damage in the same direction in which it was created. When making multiple pulls use the last in, first out procedure. This means that you correct the damage in the reverse sequence by which it was created. It is also important to correct the damage in the opposite direction in which the damage was created.

**Remove or Disconnect**

1. Brace to bumper nuts (52) (figure 1).
2. Bracket to bumper nuts (53).
3. Bumper from the vehicle.
4. Guard assemblies (where used) (figure 5).
5. Rub strips from the bumper and guards (where used) (figure 6).
   - From the rear of the bumper, press the tangs of the rub strip together, and push the strip from the bumper and/or guard.
6. Bumper bolts (56 and/or 58).
7. Brace bolts and washers (67 and 68) (figure 7) from the inside of the frame rail.
   - Braces (54).
8. Bracket bolts, washers, and nuts (66, 65 and 64) from the frame.
9. Tow hooks (70) (where used).

**Install or Connect (Figures 4-8)**

1. Brackets and tow hooks (where used) to the frame rails.
   - On vehicles without tow hooks, install the bolts and washers through the brackets and through the outside of the frame rail.
   - On vehicles with tow hooks, install the tow hook bolts and washers from inside the frame rail, then through the brackets and the tow hooks. Install the top bracket bolts and washers through the bracket, and into the top rail flange.
2. Washers and nuts to the bolts.
3. Brace bolts and washers (67 and 68) through the frame rails and into the braces.
   - Nuts to 95 N·m (70 ft. lbs.).
4. Bumper bolts (56) onto the bumper.
5. Rub strips to the bumper and guards (where used).
   - Place the tangs of the strips onto the slots in the bumper or guard. Using a rubber mallet, set the tangs in place starting at the center of the strip, and working toward each end.
6. Guard assemblies (where used).
7. Bumper to the vehicle.

**SECTION 2B**

**SHEET METAL**

NOTICE: All hood latch fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number of with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of all parts.

**HOOD REPLACEMENT**

**Remove or Disconnect (Figure 1)**
- Raise and support the hood at front and rear.
- Place protective coverings over the cowl and the fenders.
- Mark the position of the hinge on the hood.
1. Spring assembly to hood bolts (4).
2. Hood hinge to hood bolts (5).
3. Hood from the vehicle.

**Install or Connect (Figure 1)**
1. Hood to the vehicle.
2. Hood hinge to hood bolts (5).
3. Hood from the vehicle.

**SPRING ASSEMBLY REPLACEMENT**

**Remove or Disconnect (Figure 1)**
- Raise and support the hood at front and rear.
1. Spring assembly to hood bolts (4).
2. Spring assembly to fender bolts (1).
3. Spring assembly from the vehicle.

**Install or Connect (Figure 1)**
1. Spring assembly to the vehicle.
2. Spring assembly to fender bolts (1).

**Tighten**
- Bolts to 25 N·m (18 ft. lbs.).
3. Spring assembly to hood bolts (4).

**Tighten**
- Bolts to 25 N·m (18 ft. lbs.).

**HOOD HINGE REPLACEMENT**

**Remove or Disconnect (Figure 1)**
- Raise and support the hood at front and rear.
1. Cowl vent grille. Refer to “Cowl Vent Grille Replacement.”
2. Hinge to hood bolts (5).
3. Hinge to cowl bolts (6).
4. Hinge from the vehicle.

**Install or Connect (Figure 1)**
1. Hinge to the vehicle.
2. Hinge to cowl bolts (6).

**Tighten**
- Bolts to 43 N·m (32 ft. lbs.).
3. Hinge to hood bolts (5).

**Tighten**
- Bolts to 25 N·m (18 ft. lbs.).
4. Cowl vent grille. Refer to “Cowl Vent Grille Replacement.”

**PRIMARY HOOD LATCH REPLACEMENT**

**Remove or Disconnect (Figure 2)**
- Raise the hood.
1. Hood latch release cable from the latch. Refer to “Hood Release Cable Replacement.”
2. Bracket to hood latch bolts (9).
3. Hood latch from the vehicle.
4. Bracket to radiator support bolts (10).
5. Bracket from the vehicle.

**Adjust**
- Front hood bumpers, so that the top of the hood is flush with the fenders.
Install or Connect (Figure 2)
1. Bracket to the radiator support.
2. Bracket to support bolts (10) loosely.
3. Primary hood latch to the bracket.
4. Latch to bracket bolts (9) loosely.
5. Hood latch release cable to the latch.

Adjust

NOTICE: For Steps 1 and 2 refer to “Notice” on page 2B-1.
1. Hood latch bracket left and right until the striker in the hood easily engages the primary latch.
   - Raise the hood.

Tighten
- Bracket to radiator support bolts to 27 N·m (20 ft. lbs.).

2. Hood latch height so that when the hood is closed, the hood is held securely against the front hood bumpers. Mark this height.
   - Raise the hood.

NOTICE: Refer to “Notice” on page 2C-1 of this section.

Tighten
- Bracket to hood latch bolts to 27 N·m (20 ft. lbs.).

SECONDARY HOOD LATCH AND SPRING REPLACEMENT

Remove or Disconnect (Figure 3)
- Mark the position of the secondary hood latch on the hood.
1. Secondary hood latch to hood bolts (18).
2. Secondary hood latch from the vehicle.
3. Spring from the hood.
   - Twist the spring from the reinforcement.

Install or Connect (Figure 3)
1. Spring to the hood.
   - Twist the spring into the reinforcement.
2. Secondary hood latch to the vehicle.

Tighten
- Bolts to 27 N·m (20 ft. lbs.).

HOOD RELEASE CABLE REPLACEMENT

Remove or Disconnect (Figure 4)
- If the cable is broken, release the hood by pressing the primary latch tab on the right side of the lock assembly. Use a rod to press the tab.
- Raise the hood.
1. Cable from the primary latch.
Install or Connect (Figure 4)
1. New cable to the vehicle.
2. Cable through the drivers side of the cowl.
   - Push the grommet into the drivers side of the cowl.
3. Cable bolts through the cable handle, and into the air vent bezel.
4. Cable through the wheelhouse retaining strap, and the radiator support.
5. Cable to the primary latch.

HOOD ORNAMENT REPLACEMENT

Remove or Disconnect (Figure 5)
1. Raise hood.
   1. Hood ornament nuts (21).
   2. Hood ornament from the hood.
   3. Seal from the hood.

Install or Connect (Figure 5)
1. Hood seal to the ornament.
2. Hood ornament to the hood.
3. Hood ornament nuts (21).

COWL VENT GRILLE REPLACEMENT

Remove or Disconnect (Figure 6)
1. Wiper arms.
2. Cowl vent grille panel screws.
3. Cowl vent grille plastic fasteners from the windshield frame.
4. Cowl vent grille from the vehicle.
**Install or Connect (Figure 6)**

1. Cowl vent grille to the vehicle.
2. Cowl vent grille plastic fasteners to the windshield frame.
3. Cowl vent grille panel screws.
4. Wiper arms.

**GRILLE AND MOLDING REPLACEMENT**

**Remove or Disconnect (Figure 7)**

1. Lower radiator grille to grille bolt (39).
2. Radiator support to grille bolts (30).
3. Grille from the vehicle.
   - Slide the bottom of the grille from the vehicle, and then lower the grille from the vehicle.
5. Headlamp assemblies.
6. Molding assembly to fender, radiator support, and lower grille panel nuts (33, 34 and 37).
7. Molding assembly from the vehicle.
8. Right and left moldings from the upper and lower moldings.
9. Clips from the moldings.
10. Lower radiator grille to fender bolts (38).
11. Lower radiator grille to the sheet metal support bolts (40).
12. Lower radiator grille from the vehicle.

**Install or Connect (Figure 7)**

1. Lower radiator grille to the vehicle.
2. Lower radiator grille to the sheet metal support bolts (40).
3. Lower radiator grille to fender bolts (38).
4. Upper molding to the radiator support with clips (44), and nuts (33).
   - Assemble loosely.
5. Lower molding to the radiator support with clips (44), and nuts (37).
   - Assemble loosely.
6. Right and left moldings to the fenders.
   - The moldings must butt against the upper and lower moldings, and be joined to those moldings by the clips.
7. Right and left molding nuts (34).
   - Tighten upper and lower molding nuts (33 and 37).
8. Headlamp assemblies.
10. Grille to the vehicle.
    - Insert the top of the grille to the underside of the radiator support, and then slide the bottom of the grille into place.
11. Lower radiator grille to grille bolt (39).
12. Radiator support to grille bolts (30).

**FRONT FENDER REPLACEMENT**

**Remove or Disconnect (Figures 7, 8 and 9)**

Tool Required:
- J-24595-B Door Trim Pad Remover.
- Raise and support the hood.
1. Head lamp bezel.
2. Head lamp.
3. Right or left radiator grille molding nuts (34).
4. Upper and lower molding clip nuts (33 and 37).
5. Right or left radiator grille molding (36).
6. Lower radiator grille to fender bolts (38).
7. Cowl vent grille. Refer to "Cowl Vent Grille Replacement."
8. Hood spring assembly. Refer to "Spring Assembly Replacement."
9. Radiator support to fender bolts (119).
10. Wheelhouse panel to shield bolts.
11. Shield to underbody retainers using J-24595-B.
12. Shield from the vehicle.
13. Wheelhouse panel to fender bolts (50).
14. Lower door pillar to fender bolt (45) and shim(s) (46).
15. Fender to cowl bolt (47) and shim(s) (46).
   - Open the front door.
16. Upper fender to door pillar bolt (48) and shim(s) (46).
17. Fender from the vehicle.
18. Insulator from the fender.

Install or Connect (Figures 8 and 9)

1. Insulator to the fender.
2. Fender to the vehicle.
Tighten
• Bolts to 17 N·m (13 ft. lbs.).
7. Wheelhouse to fender bolts (50).

Tighten
• Wheelhouse to fender bolts (50) to 17 N·m (13 ft. lbs.).
• Lower door pillar to fender bolt to 43 N·m (31 ft. lbs.).
8. Shield to the vehicle.
9. Shield to underbody retainers.
10. Wheelhouse panel to shield bolts.

Tighten
• Fender to cowl bolt (47) to 43 N·m (31 ft. lbs.).
• Upper fender to door pillar bolt to 43 N·m (31 ft. lbs.).
11. Hood spring assembly. Refer to "Spring Assembly Replacement."
12. Cowl vent grille. Refer to "Cowl Vent Grille Replacement."
13. Lower radiator grille to fender bolts (38).
14. Right or left radiator grille molding (36).
15. Upper and lower molding clip nuts (33 and 37).
16. Right or left radiator grille molding nuts (34).
17. Head lamp.
18. Head lamp bezel.

WHEELHOUSE PANEL REPLACEMENT

RIGHT PANEL REPLACEMENT

Remove or Disconnect (Figure 9)
1. Jack handle.
2. Lug wrench.
3. Coolant recovery reservoir.
4. Air conditioning line retainers (if equipped).
• Raise and support the vehicle.
5. Right front wheel.
6. Wheelhouse panel to radiator support bolts (49).
7. Wheelhouse panel to underbody shield bolts.
8. Wheelhouse panel reinforcement to underbody bolts (52) and (53).
9. Wheelhouse panel to fender bolts (50).
10. Wheelhouse panel from the vehicle.
• Slide the panel forward to clear the lower back side of the fender well.
• Tilt the wheelhouse panel out of the vehicle.

Install or Connect (Figure 9)
1. Wheelhouse panel to the vehicle.
• Tilt the wheelhouse panel into the vehicle.
• Slide the panel into position.
2. Wheelhouse panel to fender bolts (50).

Tighten
• Bolts to 17 N·m (13 ft. lbs.).
3. Wheelhouse panel reinforcement to underbody bolts (52) and (53).
Tighten
• Bolts (52) to 17 N·m (13 ft. lbs.).
• Bolt (53) to 47 N·m (35 ft. lbs.).
4. Wheelhouse panel to underbody shield bolts.
5. Wheelhouse panel to radiator support bolts (49).

Tighten
• Bolts to 17 N·m (13 ft. lbs.).
6. Right front wheel.
• Lower the vehicle.
7. Air conditioning line retainers (if equipped).
8. Coolant recovery reservoir.
10. Jack handle.

LEFT PANEL REPLACEMENT

Remove or Disconnect (Figure 9)
1. Jack.
2. Windshield washer fluid reservoir.
3. Wiring harness.
4. Hood release cable.
5. Air conditioning hose bracket (if equipped).
• Raise and support the vehicle.
6. Left front wheel.
7. Wheelhouse panel to radiator support bolts (49).
8. Wheelhouse panel to underbody shield bolts.
9. Wheelhouse panel reinforcement to underbody bolts (52) and (53).
10. Wheelhouse panel to fender bolts (50).
11. Wheelhouse panel from the vehicle.
• Slide the panel forward to clear the lower back side of the fender well.
• Tilt the wheelhouse panel out of the vehicle.

Install or Connect (Figure 9)
1. Wheelhouse panel to the vehicle.
• Tilt the wheelhouse panel into the vehicle.
• Slide the panel into position.
2. Wheelhouse panel to fender bolts (50).

Tighten
• Bolts to 17 N·m (13 ft. lbs.).
3. Wheelhouse panel reinforcement to underbody bolts (52) and (53).

REAR FENDER REPLACEMENT

STEPSIDE MODEL FENDER REPLACEMENT

Remove or Disconnect (Figure 10)
1. Parking lamp wiring from the fender.
2. Brace to fender bolts (59).
3. Side panel to fender bolts (56).
4. Fender from the vehicle.
5. Side panel to brace bolt (56).
7. Cross sill to brace bolt (63).
9. Sealer from the fender and the side panel.

Install or Connect (Figure 10)
1. A medium bodied sealer onto the fender to side panel flange.
2. Brace (62).
3. Cross sill to brace bolt (63).
• Assemble loosely.
4. Brace (58) to the vehicle.
5. Side panel to brace bolt (56).
• Assemble loosely.
6. Fender to the vehicle.
7. Side panel to fender bolts (56).
• Assemble loosely.
8. Brace to fender bolts (59).

Tighten
• Brace to fender bolts to 17 N·m (13 ft. lbs.).
• Side panel to fender bolts to 10 N·m (7 ft. lbs.).
• Cross sill to brace bolt to 17 N·m (13 ft. lbs.).
9. Parking lamp wiring to the fender.
• Clean excess sealant from the fender.

DUAL REAR WHEEL MODEL FENDER REPLACEMENT

Remove or Disconnect (Figure 11)
1. Parking lamp wiring from the fender.
2. Fender to brace bolts (71).
3. Fender to side panel bolts (72 and 69) and nuts (68).
4. Side panel to fender nuts (66).
5. Fender from the vehicle.
6. Sealer from the side panel and fender.

Install or Connect (Figure 11)
1. A medium bodied sealer onto the fender to side panel flange.
2. Fender to the vehicle.
3. Side panel to fender nuts (66).
• Assemble loosely.
4. Fender to side panel bolts (72 and 69) and nuts (68).
• Assemble loosely.
5. Fender to brace bolts (71).

Tighten
• All of the nuts and bolts to 17 N·m (13 ft. lbs.).
6. Parking lamp wiring to the fender.
• Clean excess sealant from the fender.

SHEET METAL UNIT REPLACEMENT

Tool Required:
J-24595-B Door Trim Pad Remover.

Remove or Disconnect
1. Hood.
- Refer to "Hood Replacement" earlier in this section.
2. Battery.
- Refer to ENGINE ELECTRICAL (SEC. 6D).
3. Radiator.
- Refer to ENGINE COOLING (SEC. 6B).

18. Radiator support to frame nuts (80), lower retainers (79), lower cushions (78), upper cushions (76), retainers (75), bolts (73), and washers (74) (figure 12).
- With the aid of a helper, lift the sheet metal onto the chassis.

Install or Connect
1. Sheet metal assembly.
- With the aid of a helper, lift the sheet metal onto the chassis.
2. Radiator support to frame washers (74), bolts (73), retainers (75), upper cushions (76), lower cushions (78), lower retainers (79), and nuts (80) (figure 12).
3. Lower fender to door pillar bolts (45) (figure 8).

SHEET METAL ADJUSTMENTS

In order to have the proper operation and appearance of sheet metal components, it is important that certain fits and gaps between components be maintained. The gaps given in this procedure are suggested as the best alignment for these components (figure 13).

In aligning sheet metal, it is best to start with the rearmost component, and work forward.
1. Starting with the fenders, align the rear edge of each fender to the rocker panel, and the door. The gap between these components should be 5 mm ± 2.3 mm (0.19-inch ± 0.09-inch). This adjustment should be accomplished by moving the fender forward or rearward. The surface of the fender should be flush with the rocker panel and the door. Add or remove shims to perform this adjustment.
2. Align the fender to the cowl vent grille to obtain a gap of 4.6 mm ± 1 mm (0.18-inch ± 0.03-inch). The surface of the cowl vent grille should be flush with the fender surface.
82. Hood
83. Fender
84. Door
85. Cowl Vent Grille
86. Rocker Panel
87. Radiator Support Upper Panel

A. Flush Fit
B. Flush ± 1 mm (0.03-inch)
C. Flush +0.00 mm or -1.5 mm (+0.00-inch or -0.06-inch)
D. 4.6 mm ± 1 mm (0.18-inch ± 0.03-inch)
E. 8 mm ± 1 mm (0.31-inch ± 0.03-inch)
F. 5 mm ± 2.3 mm (0.19-inch ± 0.09-inch)
3. Align the hood with the cowl vent grille, so that there is a gap of 8 mm ± 1 mm (0.31-inch ± 0.03-inch) between the rear edge of the hood and the front edge of the cowl vent grille. The hood surface should be flush with the cowl vent grille surface within +0.0-1.5 mm (+ 0.00 -0.06-inch).

4. Align the left and right edges of the hood so that a gap of 4.6 mm ±1 mm (0.18-inch ± 0.03-inch) exists between the hood and the fenders. The hood surface should be flush with the fender surface within +0.0, -1.5 mm (+ 0.00 -0.06-inch). If this gap is difficult to obtain, and the hood appears to be cocked in between the fenders, the radiator support may need to be shifted. By shifting the radiator support, the entire front end sheet metal can be aligned as a unit. Loosen the support to the frame bolts, and shift the radiator support to obtain the proper gaps. Then, while holding the support in position, retighten the radiator support to frame bolts.

5. Align the front face of the hood to obtain a gap of 4.6 mm ±1 mm (0.18-inch ± 0.03-inch) between the hood and the radiator support upper panel. The hood bumpers on the top of the radiator support upper panel should be adjusted to give the proper support to hood gap. The surface of the hood should be flush with the radiator support upper panel (not the grille molding).

G MODELS

**HOOD REPLACEMENT**

**Remove or Disconnect (Figure 14)**
- Raise and support the hood. Place a protective covering over the fenders, and the cowl vent grille.
- Mark the position of the hinges on the hood.
  1. Hood hinge to hood bolts (89).
  2. Hood from the vehicle.

**Install or Connect (Figure 14)**
- Hood to the vehicle.
- Hood hinge to hood bolts (89).
- Align the hood with the previously made marks.
- Tighten
  - Bolts to 17 N·m (13 ft. lbs.).
  - Remove the protective coverings, and lower the hood.

**HOOD HINGE REPLACEMENT**

**Remove or Disconnect (Figure 14)**
- Raise and support the hood. Also support the rear corner of the hood.
- Mark the position of the hinge on the hood and the cowl.
  1. Hood hinge to hood bolts (89).
  2. Hood hinge to cowl bolts (90).
  3. Hood hinge from the vehicle.

**Install or Connect (Figure 14)**
- Hood hinge to the vehicle.
- Hood hinge to cowl bolts (90).
- Hood hinge to hood bolts (89).
- Align the hinge with the previously made marks.
- Tighten
  - Bolts to 17 N·m (13 ft. lbs.).

**PRIMARY HOOD LATCH REPLACEMENT**

**Remove or Disconnect (Figure 15)**
- Raise and support the hood.
  1. Hood latch release cable from the latch.
  2. Bracket to hood latch bolts (94).
  3. Hood latch from the vehicle.
  4. Bracket to the sheet metal cross panel bolts (91).
  5. Bracket from the vehicle.
Adjust
- Front hood bumpers, so that the top of the hood is flush with the fenders.

Install or Connect (Figure 15)
1. Bracket to the sheet metal cross panel.
2. Bracket to cross panel bolts (91) loosely.
3. Primary hood latch to the bracket.
4. Latch to bracket bolts (94) loosely.
5. Hood latch release cable to the latch.

NOTICE: For Steps 1 and 2 refer to "Notice" on page 2B-1.

Adjust
1. Hood latch bracket left and right until the striker in the hood easily engages the primary latch.
- Raise and support the hood.

Tighten
- Bracket to radiator support bolts to 27 N·m (20 ft. lbs.)
2. Hood latch height so that when the hood is closed, the hood is held securely against the front hood bumpers.
- Raise and support the hood.

Tighten
- Bracket to hood latch bolts to 27 N·m (20 ft. lbs.).

SECONDARY HOOD LATCH AND SPRING REPLACEMENT

Remove or Disconnect (Figure 16)
- Mark the position of the secondary hood latch on the hood.
1. Secondary hood latch to hood bolts (97).
2. Secondary hood latch from the vehicle.
3. Spring from the hood.
- Twist the spring from the reinforcement.

Install or Connect (Figure 16)
1. Spring to the hood.
- Twist the spring into the reinforcement.
2. Secondary hood latch to the vehicle.
3. Secondary hood latch to hood bolts (97).

Tighten
- Bolts to 27 N·m (20 ft. lbs.).
HOOD RELEASE CABLE REPLACEMENT

remove or Disconnect (Figure 17)

- If the cable is broken, release the hood by pressing the primary latch tab on the right side of the lock assembly. Use a rod to press the tab.
- Raise and support the hood.
  1. Cable from the primary latch.
     - Insert a screwdriver into the clip, and lift the cable from the lock. Then, carefully pry the cable grommet from the lock flange.
  2. Cable from the sheet metal cross panel clip.
  3. Grommet from the cowl.
     - Cut the grommet down to the cable casing on the engine side of the cowl.
     - Push the cable and the grommet through the cowl.

**CAB MOUNTS**

**CAB MOUNT REPLACEMENT**

When changing cab mounts, it is important to properly support the frame while changing the mount. If only one mount is to be changed, the entire side on which the mount is placed must be lowered enough to provide clearance for the mount.

** Remove or Disconnect (Figures 24 through 26)**

- Raise the vehicle slightly on the hoist.
- Place jack stands under the body on the side of the vehicle where the mounts will be replaced.

FRONT END ALIGNMENT

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology: "NOTICE": See ‘Notice’ on page 3A-1 on this section.”

NOTICE: Front end alignment fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of all parts.

"Front End Alignment" refers to the angular relationship between the front wheels, the front suspension attaching parts and the ground.

Proper front end alignment must be maintained in order to insure efficient steering, good directional stability and to prevent abnormal tire wear.

The most important factors of front end alignment are wheel toe-in, wheel camber, and axle caster (Figure 1).

**DEFINITION OF TERMS**

**CAMBER**

Camber is the inward or outward tilting of the front wheels from the vertical. When the wheels tilt outward at the top, the camber is positive (+). When the wheels tilt inward at the top, the camber is negative (−). The amount of tilt measured in degrees from the vertical is called the camber angle. Camber is designed into the front axle assembly of all four-wheel drive vehicles and is non-adjustable.

If camber is extreme or unequal between the wheels, improper steering and excessive tire wear will result. Negative camber causes wear on the inside tire, while positive camber causes wear to the outside.

**CASTER (Figure 1)**

Caster is the tilting of the wheel axis either forward or backward from the vertical (when viewed from the side of the vehicle). A backward tilt is positive (+) and a forward tilt is negative (−).

On the short and long arm type suspension you cannot see a caster angle without a special instrument, but if you look straight down from the top of the upper control arm to the ground, the ball joints do not line up (fore and aft) when a caster angle other than 0 degree is present. With a positive angle, the lower ball joint would be slightly ahead (toward the front of the vehicle) of the upper ball joint center line. Caster is designed into the front axle assembly on all four-wheel drive vehicles, and is non-adjustable.

**TOE-IN**

Toe-in is the turning of the front wheels. The actual amount of toe-in is normally a fraction of a degree. Toe-in is measured from the center of the tire treads or from the inside of the tires. The purpose of toe-in is to insure parallel rolling of the front wheels and to offset any small deflections of the wheel support system which occurs when the vehicle is rolling forward. Incorrect toe-in results in excessive toe-in and unstable steering. Toe-in is the last alignment to be set in the front end alignment procedure.

### ON-VEHICLE SERVICE

#### INSPECTION

Before making any adjustments affecting caster, camber or toe-in, the following front end inspection should be made:

1. **Inspect (Figure 2)**
   1. Tires for proper inflation pressure. Refer to WHEELS AND TIRES (SEC. 3E).
   2. Front wheel bearing for proper adjustment. Refer to FRONT SUSPENSION (SEC. 3C).
   3. Ball joints, tie rod ends, and relay rods. If excessive looseness is noted, correct before adjusting. Refer to STEERING LINKAGE (SEC. 3B1).
   4. Wheels and tires for run-out. Refer to WHEELS AND TIRES (SEC. 3E).
   5. Dimension "BC" in (figure 2). If not within specifications, the correction must be made before adjusting caster.
   6. Steering gear for looseness at the frame.
   7. Shock absorbers for leaks or any noticeable noise. Refer to FRONT SUSPENSION (SEC. 3C).
   8. Control arms or stabilizer bar attachments for looseness. Refer to FRONT SUSPENSION (SEC. 3C).
   9. Alignment equipment. Follow the manufacturer’s instructions.
   10. Level of the vehicle. The vehicle must be on a level surface fore and aft and transversely.

#### FRONT END ALIGNMENT REQUIREMENTS

Satisfactory vehicle operation may occur over a wide range of front end alignment settings. If the settings vary beyond certain tolerances, adjustments are advisable. The “Specifications” at the back of this section is a guideline for vehicle diagnosis or for repairs.

Set the front end alignment to specifications while the vehicle is in its normally loaded condition. Vehicles which are consistently operated with heavy loads should have toe-in adjusted with the vehicle under heavy load. This procedure should result in longer tire life.
A. Dimension “BC”  
B. Jounce Bumper Bracket  
C. Crossmember

D. A “DOWN IN REAR” frame angle must be SUBTRACTED from a POSITIVE caster reading.

![Diagram showing horizontal frame angle of 1° down with corresponding caster angle reading and actual (corrected) caster angle calculation.]

E. A “UP IN REAR” frame angle must be ADDED to a POSITIVE caster reading.

![Diagram showing horizontal frame angle of 1° up with corresponding caster angle reading and actual (corrected) caster angle calculation.]

F. A “DOWN IN REAR” frame angle must be ADDED to a NEGATIVE caster reading.

![Diagram showing horizontal frame angle of 1° down with corresponding caster angle reading and actual (corrected) caster angle calculation.]

G. An “UP IN REAR” frame angle must be SUBTRACTED from a NEGATIVE caster reading.

![Diagram showing horizontal frame angle of 1° up with corresponding caster angle reading and actual (corrected) caster angle calculation.]

**ALIGNMENT ADJUSTMENTS**

A normal shim pack will leave at least two threads of the bolt exposed beyond the nut. If two threads cannot be obtained, check for control arms and related parts. The difference between front and rear shim packs must not exceed 7.62 mm (0.03 inch). Front shim pack must be at least 2.54 mm (0.10 inch).

**ACCESS TO SHIM PACKS**

**Models with ¾-Inch Nut**

Jack up the frame to raise the wheel off the ground. This will allow the proper upper control arm to drop down far enough to use a socket on the nuts and permit shim adjustment. Torque to specifications, refer to FRONT SUSPENSION AND AXLE (SEC. 3C).

**Models with 7/8-Inch Nut**

Remove the upper control arm bumper; then follow the same procedure as with ¾-inch Nut. Torque to specifications. Reinstall the upper control arm bumper when alignment is completed. Refer to FRONT SUSPENSION AND AXLE (SEC. 3C).

**CASTER**

All caster specifications are given with a frame angle of zero. Therefore, it will be necessary to know the angle of the frame (whether “up” in rear or “down” in rear) before a corrected caster reading can be determined. Camber and toe-in can be read “as is” from the alignment equipment.

**How To Determine Caster (Figure 2 and 3)**

All caster specifications are given with vehicle frame angle of zero.

1. Position the vehicle on a smooth level surface.
2. Use a bubble protractor or inclinometer to measure the frame angle. Frame angle is the degree of tilt in the frame from the level position.
3. Determine whether the frame angle is “up in rear” or “down in rear.”
4. Determine the caster angle reading from the alignment equipment.
5. Refer to figure 3. To determine an “actual (corrected) caster reading” with various frame angles and caster readings, one of the following rules apply:
a. A "DOWN IN REAR" frame angle must be **SUBTRACTED** from a **POSITIVE** caster reading.
b. An "UP IN REAR" frame angle must be **ADDED** to a **POSITIVE** caster reading.
c. A "DOWN IN REAR" frame angle must be **ADDED** to a **NEGATIVE** caster reading.
d. An "UP IN REAR" frame angle must be **SUBTRACTED** from a **NEGATIVE** caster reading.

6. Dimension "BC" measured 90 degrees from the lower surface of the crossmember (C) and to the inboard rear corner of the jounce bumper bracket (B).
7. Using dimension "BC" and the caster, camber, wheel toe-in chart sheet, find the recommended caster angle.
8. If the actual (corrected) caster cycle (Step 5) is not within the recommended caster angle (Step 7) make the necessary shim changes.

**CAMBER**

1. Determine the camber angle from the alignment equipment.
2. Add or subtract shims from both the front and rear bolts to affect a change.

**TOE-IN**

1. Determine the toe-in from the alignment equipment.
2. Change the length of both tie rod sleeves to affect a toe change. Toe-in can be increased or decreased by changing the length of the tie rod ends. A threaded sleeve is provided for this purpose. When the tie rod ends are mounted ahead of the steering knuckle they must be decreased in length in order to increase toe-in. When the tie rod ends are mounted behind the steering knuckle they must be lengthened in order to increase toe-in. Refer to STEERING LINKAGE (SEC. 3B1) for clamping instructions.

STEERING LINKAGE

The following “Notice” applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology: “NOTICE: See ‘Notice’ on page 3B1-1 of this section.”

NOTICE: All steering linkage fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of all parts.

DESCRIPTION

The steering linkage for the R, G, and P20 + 30(42) model is composed of a pitman arm, idler arm, relay rod, two adjustable tie rods and a steering shock absorber (G-model). When the steering wheel is turned, the gear rotates the pitman arm which forces the relay rod to one side. The tie rods, which are connected to the relay rod by ball studs, transfers the steering force to the wheels. The tie rods are adjustable and are used for toe-in adjustments. The relay rod is supported by the pitman arm and idler arm. The idler arm pivots on a support attached to the frame rail. On the G-model the steering shock absorber is attached to a relay rod and a mounting bracket to steering gear.

The P30(32) Motorhome model steering linkage has a similar adjustable tie rod assembly as described above. When the steering wheel is turned, the gear rotates the pitman arm which forces the nonadjustable connecting rod and relay arm to move the relay rod to one side. The relay arm and idler arm are attached to the frame by support assemblies. The support assemblies are adjustable for shaft end play. The steering shock absorber is attached to the frame and relay arm (figures 1 through 3).

The V model has a front driving axle assembly and the P30(00) with RPO-FS3 has an I-Beam axle assembly. The steering linkage consists of an adjustable connecting rod, steering shock absorber, pitman arm and a tie rod which connects the two steering knuckles together (figures 7 and 8).

The overall condition of the steering linkage affects steering performance. If parts are bent, damaged, worn or poorly lubricated, improper and possibly dangerous steering action will result.

Whenever any steering linkage components are repaired or replaced, check the steering geometry and front end alignment. Refer to FRONT END ALIGNMENT (SEC. 3A).
DIAGNOSIS OF STEERING LINKAGE

Refer to MANUAL STEERING (SEC. 3B2) or POWER STEERING (SEC. 3B3) in this manual, depending on vehicle equipment.

ON-VEHICLE SERVICE

1. Idler Arm
2. Relay Rod
3. Tie Rod Assembly
4. Steering Knuckle
5. Pitman Arm
6. Steering Gear

IDLER ARM INSPECTION

Inspect (Figures 4 and 5)

1. Raise the vehicle. Allow the front wheels to rotate freely and the steering mechanism freedom to turn. Position the wheels in a straight ahead position.

2. Place a spring scale near the relay rod end of the idler arm. Exert a 110 N (25 lb.) force upward and then downward (G model the force is forward and rearward) while measuring the total distance the arm moves. The allowable deflection is ± 3.18mm (1/8 inch) for a total of 6.35mm (1/4 inch) (figures 4 and 5). Replace the idler arm if it fails this test with the exception of the P model motorhome. Refer to “Idler Arm Adjustment (P30(32) Motorhome),” in this section.

Important

- Jerking the right wheel and tire assembly back and forth, causing an up and down movement of the idler arm, is NOT an acceptable testing procedure. There is no control on the amount of force being applied to the idler arm.

- Care should be used whenever shimmy complaints are suspected of being caused by loose idler arms. Before suspecting suspension or steering components, technicians should consider areas such as dynamic imbalance, runout or force variation of wheel and tire assemblies and road surface irregularities. Refer to WHEELS AND TIRES (SEC. 3E).

IDLER ARM ADJUSTMENT (P30(32) MOTORHOME)

The frame mounted idler support assembly (10) is adjustable for support shaft end play. Check for idler arm movement as described in “Idler Arm Inspection.” If the idler arm fails this test, adjust the support shaft end-play.

Adjust (Figure 3)

1. Loosen the support assembly jam nut.
2. Tighten the adjuster plug to metal-to-metal contact.
3. Back off the adjuster plug 1/8 of a turn (1/2 of a flat on the square nut).
**IDLER ARM REPLACEMENT**

**Important**
- Do not attempt to free the ball stud by using a pickle fork or wedge type tool, because seal or bushing damage could result (figure 6). Use the proper tool to separate all ball joints.

**Remove or Disconnect (Figures 1 and 2)**

- Raise the vehicle.
- 1. Idler arm frame bolts.
- 2. Nut from the idler arm ball stud.
- 3. Idler arm (1) from the relay rod (2). Use J-24319-01.

**Inspect**
- Ball stud threads for damage.
- Ball stud seal for cuts or other damage.

**Clean**
- Threads on the ball stud and in the ball stud nut.

**Install or Connect (Figures 1 and 2)**

- Position the idler arm (1) on the frame.
- 1. Frame bolts to the idler arm.
- 2. Relay rod (2) to the idler arm ball stud. Make certain the seal is on the stud. Tighten tool J-29193 or J-29194 to 54 N·m (40 ft. lbs.) to seat the tapers. Remove the tool.
- 3. Prevailing torque nut to the idler arm ball stud.

**Tighten**
- 1. Jam nut to 40 N·m (30 ft. lbs.). The adjusting plug should not rotate.
- Notice: For steps 1 and 3 see “Notice” on page 3B1-1 of this section.
- Position the idler arm (1) on the frame.
- Bolts to “Specifications” at the end of this section.
- Nut to “Specifications” at the end of this section.
- Lower the vehicle.
- Toe-in if necessary. Refer to FRONT END ALIGNMENT (SEC. 3A) in this manual.

**RELAY ROD REPLACEMENT**

Important
• Use the proper tool to separate all tie rod and ball joints.

Remove or Disconnect (Figures 1 through 3)

Tool Required:
J-24319-01 Steering Linkage Puller.

• Raise the vehicle.
1. Inner tie rod (3) from the relay rod (2). Refer to “Tie Rod Replacement” in this section.
2. Nuts from the idler arm (1) and pitman arm (5) or relay arm (11) ball studs at the relay rod (2).
3. Relay rod (2) from the idler arm (1). Use J-24319-01.
4. Relay rod (2) from the pitman arm (5) or relay arm (11). Use J-24319-01.

Inspect
• Threads on the tie rod and the tie rod end for damage.
• Ball stud threads for damage.
• Ball stud seals for excessive wear.
1. Relay rod (2) to the idler arm (1) and the pitman arm (5) or relay arm (11) ball stud. Make certain the seal is on the stud. Tighten J-29193 or J-29194 to 54 N·m (40 ft. lbs.) to seat the tapers. Remove the tool.

**NOTICE:** See "Notice" on page 3B1-1 of this section.

2. Nuts to the idler arm and the pitman arm or relay arm ball stud.

   - **Tighten**
     - Nuts to "Specifications" at the end of this section.

3. Inner tie rod (3) to the relay rod. Refer to "Tie Rod Replacement."

   - Lower the vehicle.

### PITMAN ARM REPLACEMENT

**Important**
- Use the proper tool to separate all ball joints.

**Remove or Disconnect (Figures 1, 2, 3, 7 and 8)**

**Tools Required:**
- J-24319-01 Steering Linkage Puller.
- J-29107 Pitman Arm Puller.
- J-6632-01 Pitman Arm Remover.

- Raise the vehicle.

1. Relay rod nut or connecting rod nut and cotter pin from the pitman arm ball stud.

2. Relay rod (2) or connecting rod (8) from the pitman arm (5). Use J-24319-01.

3. Pitman arm nut and washer.
   - Mark the pitman arm and the pitman shaft. This will permit proper alignment at assembly.

   **NOTICE:** Do not hammer on pitman arm, pitman shaft, or puller. Damage to pitman arm or steering gear may result.

**Inspect**
- Ball stud threads for damage.
- Ball stud seals for excessive wear.

**Clean**
- Threads on the ball stud and ball stud nut.

**Install or Connect (Figures 1, 2, 3, 7 and 8)**

**Tools Required:**
- J-29193 Steering Linkage Installer (12mm).
- J-29194 Steering Linkage Installer (14mm).
3. Tie Rod Assembly
4. Steering Knuckle
5. Pitman Arm
6. Steering Gear
7. Shock Absorber
8. Connecting Rod Assembly

NOTICE: For steps 2 and 4 see “Notice” on page 3B1-1 of this section.

NOTICE: If a clamp type pitman arm is used, spread the pitman arm just enough, with a wedge, to slip the arm onto the pitman shaft. Do not spread the pitman arm more than required to slip over the pitman shaft with hand pressure. Do not hammer, or damage to the steering gear may result.

1. Pitman arm (5) on the pitman shaft. Line up the marks made at removal.
2. Pitman arm washer and nut.
   - Pitman arm nut to “Specifications” at the end of this section.
3. Relay rod (2) or connecting rod (8) to the pitman arm ball stud. Make certain the seal is on the stud. Tighten tool J-29193 or J-29194 to 54 N·m (40 ft. lbs.) to seat the tapers. Remove the tool.
4. Relay rod nut or the connecting rod castellated nut and cotter pin to the pitman arm ball stud.
   - Castellated nut to “Specifications” as instructed at the end of this section.
   - Lower the vehicle.

STEERING SHOCK ABSORBER INSPECTION

Steering shock absorbers are a sealed assembly and are nonrepairable. Replace the complete assembly if damaged.

Inspect (Figures 2, 3, 7 and 8)

1. Shock absorber for fluid leakage. A slight film of fluid is allowable near the shaft seal. If there is excessive fluid leakage, be sure it’s from the shock absorber and then replace the shock absorber.
2. Shock absorber bushing for excessive wear. Replace the shock absorber if necessary.
3. Test the shock absorber.
   - Disconnect the shock absorber from the frame or axle end.
   - Extend and compress the shock absorber using as much travel as possible. Resistance should be smooth and constant for each stroking rate. Replace the shock absorber if any binding or unusual noises are present.
   - Install the end of the shock absorber. Torque to specifications.
STEERING SHOCK ABSORBER REPLACEMENT

Remove or Disconnect

1. Shock absorber mounting nuts and washers.
   - Washer (12) and grommet (13) (P30(32) model).
2. Cotter pin and castellated nut.
3. Shock absorber (7).

Inspect

- Shock absorber for leaks and damage.
- Shock absorber bushings for wear and damage.
- Grommet (13) for wear.

Install or Connect

NOTICE: For steps 2 and 3 see “Notice” on page 3B1-1 of this section.

1. Shock absorber with bushings to the axle bracket.
   - Washer (12) and grommet (13) (P30(32) model).
2. Shock absorber mounting nuts and washers.

Tighten

- Shock absorber nuts to “Specifications” at the end of this section.
3. Castellated nut and cotter pin.

Tighten

- Castellated nut to “Specifications” as instructed at the end of this section.

TIE ROD REPLACEMENT (R, G, P20 AND 30(42) MODELS)

There are two tie rod assemblies. Each assembly is of a five piece construction, consisting of an adjuster tube, two clamps and two tie rod ends. The ends are threaded into the sleeve and secured with the clamps. Right and left hand threads are used for toe-in adjustments and steering gear centering. The tie rod ends should be replaced when
excessive up and down motion is present, or when excessive end play or loss of motion at the ball stud exists.

Before servicing, note the position of the tie rod adjuster tube and the direction the bolts are installed. The tie rod adjuster tube components may be rusted. If the torque required to remove the nut from bolt exceeds 9 N·m (7 ft. lbs.) discard the nuts and bolts. Apply penetrating oil between the clamp and tube and rotate the clamps until they move freely. Install all parts, with the correct part number, in the proper position.

**Important**

- Use the proper tool to separate all tie rod and ball joints.

**Remove or Disconnect (Figures 1, 2, 3, and 9)**

Tool Required:
- J-6627-A Wheel Stud Remover and Tie Rod Remover.
- Raise the vehicle.
- Cotter pins and castellated nuts from the outer tie rod ball stud.
- Outer tie rod ball studs from the steering knuckle (4). Use J-6627-A (Figure 9).
- Inner tie rod ball stud from the relay rod (2). Use J-6627-A.
- Tie rod ends from the adjuster tube. Loosen the clamp bolts and unscrew the end assemblies.

**Inspect**

- Tie rod end for damage.
- Tie rod end seals for excessive wear.
- Threads on the tie rod and tie rod end for damage.
- Ball stud threads for damage.
- Adjuster tube for bending or damaged threads.

**Clean**

- The tapered surfaces.
- Threads on the ball stud and in the ball stud nut.

**Install or Connect (Figures 1 through 3)**

Tools Required:
- J-29193 Steering Linkage Installer (12mm).
- J-29194 Steering Linkage Installer (14mm).

**NOTICE:** For steps 3 and 5 see "Notice" on page 3B1-1 of this section.

- If the rod ends were removed, lubricate the tie rod threads with chassis lubricant.
- 1. Tie rod ends to the adjuster tube. The number of threads on both the inner and outer rod ends must be equal within three threads.
- 2. Inner tie rod ball studs to the relay rod (2). The seal must be on the stud. Tighten J-29193 or J-29194 to 54 N·m (40 ft. lbs.) to seat the tapers. Remove the tool.
- 3. Prevailing torque nut to the inner tie rod ball stud.

**Tighten**

- Nut to "Specifications" at the end of this section.
- Outer tie rod ball studs to the steering knuckle.
- Castellated nuts to "Specifications" as instructed at the end of this section.

**Adjust (Figures 10, 11, and 12)**

- Toe-in. Refer to FRONT END ALIGNMENT (SEC. 3A) in this manual.
- Adjuster tube clamp bolts (figures 10, 11 and 12). Before tightening the clamp bolts, be sure the following conditions have been met:
  - The clamp must be positioned between the locating dimples at either end of the adjuster tube.
  - The clamps must be positioned within the angular travel shown in figures 10, 11 or 12.
  - Both inner and outer tie rod ends must rotate for their full travel. The position of each tie rod end must be maintained as the clamps are tightened to ensure free movement of each joint.
  - The clamp ends may touch when nuts are torqued to specification, but the gap next to the adjuster tube must NOT be less than the minimum dimension shown in figures 10, 11 or 12.

**Tighten**

- Adjuster tube clamp bolts to "Specifications" at the end of this section.

**TIE ROD REPLACEMENT (V AND P30(00)FS3 MODELS)**

**Remove or Disconnect (Figures 7 and 8)**

Tool Required:
- J-6627-A Wheel Stud Remover and Tie Rod Remover.
4. Steering Knuckle
C. Clamps Must Be Between And Clear Of Dimples Before Torquing Nuts
D. Adjuster Tube Slot
E. Slot In Adjuster Tube Must Not Be Within This Area Of Clamp Jaws.
F. Rearward Rotation
G. Clamp Ends May Touch When Nuts Are Torqued To Specifications.
   But The Gap Next To The Adjuster Tube Must Be Visible. Minimum Gap Is 0.127 mm (0.005 Inch).

1. Cotter pins and castellated nuts from the rod assembly (3).
2. Shock absorber (7) from the tie rod assembly (3).
3. The rod ball studs from the steering knuckle (4). Use J-6627-A.
4. Tie rod end bodies. Count the number of turns needed to remove the tie rod end bodies.
5. Tie rod ends from the adjuster tube. On V30 models, note the position of the adjuster tube, and the direction from which the bolts are installed.

Inspect
- Tie rod for bending or damaged threads.
- Tie rod end seals for wear.
- Ball stud threads for damage.
- Adjuster tube for bending or damaged threads (V30).

Clean
- The tapered surfaces.
- Threads on the ball stud and in the ball stud nut.

Install or Connect (Figures 7 and 8)
- If the tie rod ends were removed, lubricate the tie rod threads with chassis lubricant.
1. Tie rod end bodies to the tie rod (if removed). Screw the rod assembly on the same number of turns as when removed.
- Tie rod ends to the adjuster tube (V30).
2. Outer tie rod ball studs to the steering knuckle (4).
3. Shock absorber (7) to the tie rod assembly.

NOTICE: See "Notice" on page 3B1-1 of this section.
4. Castellated nuts and cotter pins to the tie rod assembly.

Tighten
- Castellated nuts to "Specifications" as instructed at the end of this section.

Adjust
- Toe-in. Refer to FRONT END ALIGNMENT (SEC. 3A) in this manual.

Tighten
- Jam nut at the tie rod end bodies to "Specifications" at the end of this section.
- Adjuster tube clamp bolts to "Specifications" at the end of this section (V30).

CONNECTING ROD REPLACEMENT (V AND P30(00)FS3 MODEL)
The adjustable connecting rod is used for centering the steering gear with the front axle. Replace the connecting rod if the rod is bent or if the ball stud is loose.

Important
- Use the proper tool to separate all ball joints.

Remove or Disconnect (Figures 7 and 8)
Tool Required:
- J-24319-01 Steering Linkage Puller.
1. Raise the vehicle.
- Castellated nuts and cotter pins from the connecting rod (8).
2. Connecting rod (8) from the pitman arm (5). Use J-24319-01.

Important
- Before removing the connecting rod adjuster tube, note the position of the tube and the direction from which the bolts are installed.
4. Connecting rod ends from the adjuster tube. Loosen the clamp bolts and unscrew the end assemblies.
- The connecting rod adjuster tube components may be rusted. If the torque required to remove the nut from the bolt exceeds 9 N·m (7 ft. lbs.) discard the nuts and bolts.
- Apply penetrating oil between the clamps and the tube. Rotate the clamps until they move freely.

Inspect
- Ball stud threads for damage.
- Ball stud seals for wear.
- Adjuster tube for bending or damaged threads.

Clean
- Threads on the ball stud and ball stud nut.

Install or Connect (Figures 7, 8, 13, and 14)
NOTICE: For steps 3 and 5 see "Notice" on page 3B1-1 of this section.
- If the connecting rod ends were removed, lubricate the connecting rod threads with chassis lubrication.
1. Connecting rod ends to the adjuster tube. The number of threads on both the inner and outer connecting rod ends must be equal within three threads.
2. Inner connecting rod (8) ball stud to the pitman arm (5) (on V models install the short end). Make certain the seal is on the stud.
3. Castellated nut and cotter pin to the inner connecting rod ball stud.

Tighten
- Castellated nut to "Specifications" as instructed at the end of this section.
4. Outer connecting rod ball stud to the steering knuckle (4).
5. Castellated nut and cotter pin to the outer connecting rod ball stud.

Tighten
- Castellated nut to "Specifications" as instructed at the end of this section.
The connecting rod ends to the pitman arm and steering knuckle must be in correct relationship to each other after adjustment within ± 2 degrees (V model).

**Adjust**
- Steering gear high point centering. Refer to POWER STEERING (SEC. 3B3) in this manual.

6. Adjuster tube clamp bolts (figures 13 and 14). Before tightening the clamp bolts, be sure the following conditions have been met.
- The clamps must be positioned between the locating dimples at either end of the adjuster tube.
- The clamps must be positioned within the angular travel shown in figures 13 and 14.
- The clamp ends may touch when nuts are torqued to specification, but the gap adjacent to adjuster tube must NOT be less than minimum dimension shown in figures 13 and 14.
- Both inner and outer connecting rod ends must rotate for their full travel. The position of each connecting rod end must be maintained as the clamps are tightened to ensure free movement of each joint.

**Tighten**
- Adjuster tube bolts to "Specifications" at the end of this section.
- Lower the vehicle.

**CONNECTING ROD REPLACEMENT (P30(32) MOTORHOME)**

The non-adjustable connecting rod is used to connect the pitman arm to the relay arm. Replace the connecting rod if the rod is bent or the ball stud is loose.

**Important**
- Use the proper tool to separate the ball joints.

**Remove or Disconnect (Figure 3)**

Tool Required:
- J-24319-01 Steering Linkage Puller.
- Raise the vehicle.
1. Castellated nuts and cotter pins from the connecting rod (8).
2. Connecting rod (8) from the pitman arm (5). Use J-24319-01.

**Inspect**
- Ball stud threads for damage.
- Ball stud seals for excessive wear.

**Clean**
- Threads on the ball stud and ball stud nut.

MANUAL STEERING GEAR

The following notice applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology "NOTICE: See 'Notice' on page 3B2-1 of this Section."

NOTICE: These fasteners are important attaching parts in that they could affect the performance of vital components and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of these parts.

DESCRIPTION

The steering gear is the recirculating ball nut and worm type. The worm is located on the lower end of the steering shaft. The ball nut is mounted on the worm and the steel balls act as a rolling thread between the worm and nut to provide a low friction drive between them.

Teeth on the ball nut engage teeth on the pitman shaft sector. The teeth on the ball nut are made so that a tighter fit exists between the ball nut and pitman shaft sector teeth when the front wheels are in the straight ahead position. The sector teeth are slightly tapered so that a proper preload may be obtained by moving the pitman shaft endways by means of a preload adjuster screw which extends through the gear housing side cover. The head of the preload adjuster and a selectively fitted shim fit snugly into a T-slot in the end of the pitman shaft, so that the screw also controls the end play of the shaft (figure 1).

</table>
| **Rattle Or Chuckle In The Steering Gear** | 1. Insufficient or improper lubricant in the steering gear.  
2. Pitman arm loose on the shaft or the steering gear mounting bolts loose.  
3. Loose or worn steering shaft bearing.  
4. Excessive over-center lash or worm thrust bearings adjusted too loose. On turns a slight rattle may occur, due to the increased lash between ball nut and pitman shaft as gear moves off the center of “high point” position. This is normal and lash must not be reduced to eliminate this slight rattle. | 1. Add specified lube.  
2. Tighten to specified torque.  
3. Replace steering shaft bearing.  
4. Adjust steering gear to specified preloads. |
| **Poor Return Of The Steering Wheel**   | 1. Steering column misaligned.  
2. Insufficient or improper lubricant in the steering gear or front suspension.  
3. Steering gear adjusted too tight.  
4. Front wheel alignment incorrect (Caster). | 1. Align the column.  
2. Lubricate as specified.  
3. Adjust over-center and thrust bearing preload to specifications.  
4. Adjust to specifications. |
| **Excessive Play Or Looseness In The Steering System** | 1. Front wheel bearings loosely adjusted.  
2. Steering system out of alignment.  
3. Worn upper ball joints. | 1. Adjust bearings or replace with new parts as necessary.  
2. Align caster, camber, and toe-in.  
3. Check and replace ball joints if necessary. |

5. Check the alignment and correct as necessary. |

### ON-VEHICLE SERVICE

#### MAINTENANCE

The steering gear is factory-filled with steering gear lubricant. Seasonal change of the lubricant should not be performed and the housing should not be drained. No additional lubrication is required for the life of the steering gear.

At intervals specified in MAINTENANCE AND LUBRICATION (SEC. 0B) of this manual, the gear should be inspected for seal leakage (actual solid grease — not just oily film). If a seal is replaced or the gear is overhauled, the gear housing should be refilled with Steering Gear Lubricant meeting GM specification 1051052 (or equivalent).

**NOTICE:** DO NOT USE EP Chassis Lube to lubricate the gear. DO NOT OVER-FILL the gear housing, or damage may occur.

#### STEERING GEAR REPLACEMENT

**+++ Remove or Disconnect (Figure 1, 2 and 3)**

**Tools Required:**
- J-6632-01 Pitman Arm Remover
- J-29107 Pitman Arm Puller
- Place the front wheels in a straight ahead position.

1. Flexible coupling to steering shaft nuts (9) (R-Models).

2. Lower universal joint pinch bolt (6) (G-Models). Mark the relationship of the clamp (20) to the wormshaft (11).  
   - Mark the relationship of the pitman arm (12) to the pitman shaft (21).  
3. Pitman shaft nut (13) and washer (14).  
4. Pitman arm (12) from the pitman shaft (21). Use J-6632-01 or J-29107 (figure 3).  
5. Frame bolts (1) and washers (2).  
6. Pinch bolt (6) and coupling (7) from the wormshaft (11) (C-Models).  
7. Gear assembly.  

**+++ Install or Connect (Figure 1 and 2)**

**NOTICE:** See “Notice” on page 3B2-1 of this section for steps 3, 5 and 8.

#### C-Models

1. Flexible coupling (7) onto the steering gear wormshaft (11).  
   - Align the flat in the coupling with the flat on the shaft.  
   - Push the coupling onto the shaft until the wormshaft bottoms on the coupling reinforcement.

2. Pinch bolt (6) and torque to 41 N·m (30 ft. lbs.). The bolt must pass through the shaft undercut.  
   - Place the steering gear in position, guiding the coupling bolt into the shaft flange.

3. Steering gear to frame bolts (1) and torque to 100 N·m (75 ft. lbs.).
Figure 2—Steering Gear - G Models

- Important
  - If flexible coupling alignment pin plastic spacers were used, make sure they are bottomed on the pins.
  - If flexible coupling alignment pin plastic spacers were not used, center the pins in the slots in the steering shaft flange.

4. Washer (8) and nut (9) onto the coupling bolts.

PITMAN SHAFT SEAL REPLACEMENT

The pitman shaft seal may be replaced without removing the steering gear. Remove the pitman arm as outlined under "Steering Gear Replacement" or refer to STEERING LINKAGE (SEC. 3B1).

Remove or Disconnect (Figure 4)

• Rotate the steering wheel from stop to stop, counting the total number of turns. Then turn back exactly halfway, placing the gear on center (the wormshaft flat (27) should be at the 12 o'clock position).
1. Side cover bolts (25).
2. Pitman shaft (21) and side cover (26) assembly from the housing.

3. Pitman shaft seal from the gear housing using a screwdriver. Be careful not to damage the housing bore.
4. Jam nut (5).
5. Side cover (26) from the pitman shaft assembly. Turn the adjuster screw (4) clockwise.

Inspect

• Gear lubricant for contamination. If contaminated, the gear must be removed and overhauled.

Install or Connect (Figure 4 and 5)

• Lubricate the new pitman shaft seal with steering gear lubricant.
1. Pitman shaft seal. Position the seal in the pitman shaft bore and tap into position using a 25 mm (1 inch) pipe or socket (figure 5).
• Place the pitman shaft (21) in the steering gear so that the center tooth of the pitman shaft sector enters the center tooth space of the ball nut.
• Fill the steering gear housing with Steering Gear Lubricant meeting GM Specification 1051052 (or equivalent).
2. New gasket onto the gear housing.
3. Side cover (26) onto the adjuster screw (4). Reach through the threaded hole in the side cover with a small screwdriver and turn the adjuster screw counterclockwise until it bottoms and turns back in 1/4 turn.
4. Side cover bolts (25) and torque to specifications.
5. Jam nut (5).

Adjust

• Steering gear as outlined under "Steering Gear Adjustments."
6. Pitman arm.
STEERING GEAR ADJUSTMENTS

Before any adjustments are made to the steering gear, in an attempt to correct such conditions as shimmy, loose or hard steering etc., a careful inspection should be made of the front end alignment, shock absorbers, wheel balance and tire pressure for the possible steering system problem.

Correct adjustment of the steering gear is very important. Perform adjustments following the sequence listed below.

Remove or Disconnect (Figures 1, 2, 3 and 4)

Tools Required:
J-6632-01 Pitman Arm Remover
J-29107 Pitman Arm Puller

1. Battery ground cable.
2. Pitman arm nut (13) and washer (14).
3. Pitman arm using J-6632-01 or J-5504-D (figure 2).
4. Horn cap or cover.

**Notice: Do not turn the steering wheel hard against the stops when the steering linkage is disconnected from the gear as damage to the ball guides could result.**

Measure (Figure 6)

- "Bearing drag" by applying a torque wrench with the socket on the steering wheel nut and rotate through a 90 degree arc. Do not use a torque wrench having a maximum torque reading of more than 6 N·m (50 in. lbs.).

Adjust (Figure 4)

- Thrust bearing preload as follows:
  1. Tighten the adjuster plug (16) until the proper "loading preload" is 0.6-1 N·m (5-8 in. lbs.).

  **Notice: See "Notice" on page 3B2-1 of this section.**

  2. Tighten the adjuster nut (15) to 115 N·m (85 ft. lbs.).

  3. If the gear feels "lumpy" after adjustment, there is probably damage in the bearings due to severe impact or improper adjustment; the gear must be disassembled for replacement of damaged parts.

- Over-center preload as follows:
  1. Turn the steering wheel gently from one stop all the way to the other carefully counting the total number of turns. Turn the wheel back exactly half-way to the center position.

  2. Turn the over center adjuster screw (4) clockwise to take out all lash between the ball nut and pitman shaft sector teeth and then tighten the jam nut (5).

  **Important**
  - If maximum torque is exceeded, turn over center adjuster screw (4) counterclockwise, then come up on adjustment by turning the jam nut (5) in a clockwise motion.

Tighten

- Jam nut (5) to 30 N·m (22 ft. lbs.).

3. Check the torque at the steering wheel, taking the highest reading as the wheel is turned through center position. Refer to "Specifications" for the proper over-center preload.

4. If necessary, loosen jam nut (5) and adjust over center adjuster screw (4) to obtain proper torque. Tighten the jam nut (5) and recheck torque reading through center of travel.

Remove or Disconnect (Figures 1 and 2)

1. Pitman arm (12) onto the pitman shaft (21). Line up the marks made during disassembly.

  **Notice:See "Notice" on page 3B2-1 of this section.**

2. Washer (14) and nut (13).

Tighten

- Nut to 250 N·m (185 ft. lbs.).

3. Horn cap or cover.

- Lower the vehicle to the floor.

4. Battery ground cable.
STEERING GEAR HIGH POINT CENTERING

1. Set the front wheels in the straight ahead position. This can be checked by driving the vehicle a short distance on a flat surface.
2. With the front wheels set straight ahead, check the position of the mark on the wormshaft designating the steering gear high point. This mark should be at the top side of the shaft at 12 o'clock position and lined up with the mark in the coupling lower clamp.

3. If the gear has been moved off high point when setting wheel in straight ahead position, loosen adjusting sleeve clamp on both left and right hand tie rods. Then turn both sleeves an equal number of turns in the same direction to bring gear back on high point.

   **Important**
   - Turning the sleeves an unequal number of turns or in different directions will disturb the toe-in setting of the wheels.
4. Adjust toe-in as outlined in FRONT END ALIGNMENT (SEC. 3A) (if necessary).
5. Orient sleeves and clamps when fastening and torquing clamps to specifications. Refer to STEERING LINKAGE (SEC. 3B1).

DESCRIPTION

The hydraulic power steering system consists of a pump, an oil reservoir, a steering gear, a pressure hose, and a return hose (figure 1).

INTEGRAL POWER STEERING GEAR

The power steering gear (figure 2) has a recirculating ball system which acts as a rolling thread between the worm shaft and the rack piston. The worm shaft is supported by a thrust bearing preload and two conical thrust races at the lower end, and a bearing assembly in the adjuster plug at the upper end. When the worm shaft is turned right, the rack piston moves up in gear. Turning the worm shaft left moves the rack piston down in gear. The rack piston teeth mesh with the sector, which is part of the pitman shaft. Turning the worm shaft turns the pitman shaft, which turns the wheels through the steering linkage.

HYDRAULIC PUMPS

The hydraulic pump is a vane-type design. There are two types, submerged and nonsubmerged. Submerged pump (P models) have a housing and internal parts that are inside the reservoir and operate submerged in oil. The nonsubmerged pump (TC models with or without reservoir) function the same as the submerged pump except that the reservoir is separate from the housing and internal parts (figure 3).

There are two bore openings at the rear of the pump housing. The larger opening contains the cam ring, pressure plate, thrust plate, rotor and vane assembly, and
end plate. The smaller opening contains the pressure line union, flow control valve, and spring. The flow control orifice is part of the pressure line union. The pressure relief valve inside the flow control valve limits the pump pressure (figure 4).

<td>Objectionable &quot;Hiss&quot;</td>
<td>1. Noisy relief valve in the hydraulic pump.</td>
<td>1. There is some noise in all power steering systems. One of the most common is a hissing sound most evident at standstill parking. Hiss is a high frequency noise. The noise is present in every valve and results from high velocity fluid passing valve orifice edges. There is no relationship between this noise and performance of the steering. &quot;Hiss&quot; may be expected when steering wheel is at end of travel or when slowly turning at standstill. **OIL LEAK CHECK**

1. With the vehicle's engine off, wipe the complete power steering system dry (gear, pump, hoses, and connections).

2. Check the oil level in the pump’s reservoir and adjust as directed. Refer to “Fluid Level Adjustment” in this section.

3. Start the engine and turn the steering wheel from stop to stop several times. Do not hold the wheel against the stops as this may damage the pump.

4. Find the exact areas of leakage and use the recommended method of repair as shown in figure 5.

**POWER STEERING SYSTEM TEST**

The power steering system may be tested using either J-5176-D, Power Steering Gage, or with J-25323, Power Steering Analyzer. J-25323 will measure the flow rate in addition to the pressure (figure 6).

The power steering system test is a method used to identify and isolate hydraulic circuit difficulties. Prior to performing this test the following inspection, and corrections if necessary, must be made.

1. Inspect
   - Pump reservoir for proper fluid level.
   - Pump belt for proper tension.
   - Tires for correct air pressure.
   - Power steering system, replacing parts as necessary.
60. Replace the drive shaft seal. Make certain that the drive shaft is clean and free of pitting in the seal area.
61. Replace the reservoir O-ring seal.
62. Torque hose fitting nut to 35 N-m (25 ft. lbs.). If leakage persists, replace the O-ring seal.
63. Torque fitting to 75 N-m (55 ft. lbs.). If leakage persists, replace the O-ring seal.
64. Torque hose fitting nut to 48 N-m (35 ft. lbs.). If leakage persists, replace the brass connector and reface the tube flare. If nut threads are damaged, replace the nut.
65. Replace the O-ring seal.
66. If leakage is observed at (A), following manufacturer’s directions apply Loctite 75559 solvent and Loctite 290 adhesive, or equivalent, to tube-housing connection. If leakage is coming from (B), replace the return tube. If coming from (C), replace the hose or clamp.
67. Seat the plug in the housing. Following manufacturer’s directions apply Loctite 75559 solvent and Loctite 290 adhesive, or equivalent, to plug-housing area.
68. Seat the ball in the housing with a blunt punch. Following manufacturer’s directions apply Loctite 75559 solvent and Loctite 290 adhesive, or equivalent, to area.
69. Check the oil level; if leakage persists with the level correct and cap tight, replace the cap.
70. If a cracked or bent reservoir is detected, replace the reservoir.
71. Torque jam nut to 48 N-m (35 ft. lbs.). Replace the nut if leakage persists.
72. Torque side cover bolts to 60 N-m (45 ft. lbs.). Replace the side cover seal if leakage persists.
73. Torque hose fitting nut to 27 N-m (20 ft. lbs.). If leakage persists, replace the O-ring seal.
74. Check for seepage between the torsion bar and stub shaft. Replace the rotary valve assembly.
75. Seat the ball in the housing with a blunt punch. Apply Loctite 75559 solvent and Loctite 290 adhesive, or equivalent, to the ball area.
76. Replace the adjuster plug seals.
77. Replace both pitman shaft seals.
78. Replace end plug O-ring seal.
Figure 6—Tools for Power Steering System Test

**Important**

- All tests are made with the engine idling at normal operating temperature. Check the idle adjustment and if necessary adjust the engine idle speed to the correct specification. Refer to FUEL SYSTEMS (SEC. 6C).

**Test With J-5176-D**

1. Place a container under the steering gear or pump to catch the fluid when disconnecting or connecting the hoses.
2. With the engine NOT running, disconnect the pressure hose at the steering gear or power steering pump and install J-5176-D to both hoses using adapter fitting J-5176-20. The gage must be between the shut-off valve and pump. Open the shut-off valve.
3. Remove the filter cap from the pump reservoir and check the fluid level. Fill the pump reservoir, with power steering fluid, to the full mark on the dipstick. Start the engine and, momentarily holding steering wheel against stop, check the connections at J-5176-D for leakage.
4. Bleed the system. Refer to “Bleeding the Power Steering System.”
5. Insert thermometer J-5421-02 in the reservoir filler opening. Move the steering wheel from stop to stop several times until the thermometer indicates that the hydraulic fluid in the reservoir has reached a temperature of 65° to 77°C (150° to 170°F).

**Important**

- To prevent scrubbing flat spots on the tires, do not turn the steering wheel more than five times without rolling the vehicle to change the tire-to-floor contact area.
6. Start the engine and check the pump’s fluid level. Add power steering fluid if required. When the engine is at normal operating temperature, the initial pressure read on the gage (valve open) should be in the 550-860 kPa (80-125 psi) range. Should this pressure be in excess of 1380 kPa (200 psi) — check the hoses for restrictions and the poppet valve for proper assembly.

**NOTICE:** Do not leave valve fully closed for more than 5 seconds as the pump could be damaged internally.

7. Close the gate valve fully 3 times. Record the highest pressures attained each time.
   - If the pressures recorded are within the specifications at the end of this section, and the range of readings is within 345 kPa (50 psi), the pump is functioning within its specifications.
   - If the pressures recorded are high, but do not repeat within 345 kPa (50 psi), the flow controlling valve is sticking. Remove the valve, clean it and remove any burrs using crocus cloth or fine hone. If the system contains some dirt, flush it. If it is exceptionally dirty, both the pump and gear must be completely disassembled, cleaned, flushed and reassembled before further usage.
   - If the pressures recorded are constant but more than 690 kPa (100 psi), below the minimum listed specification, replace the flow control valve and recheck. If the pressures are still low, replace the rotating group in the pump.
8. If the pump checks within specifications, leave the valve open and turn (or have turned) the steering wheel into both corners. Record the highest pressures and compare with the maximum pump pressure recorded. If this pressure cannot be built in either (or one) side of the gear, the gear is leaking internally and must be disassembled and repaired.
9. Shut the engine off, remove the testing gage, reconnect the pressure hose, check the fluid level and/or make the needed repairs.
10. If the problem still exists, the steering and front suspension must be thoroughly examined. Refer to “Diagnosis of Power Steering System.”
Test With J-25323
1. Place a container under the steering gear or pump to catch the fluid when disconnecting or connecting the hoses.
2. With the engine NOT running, disconnect the pressure hose at the steering gear or power steering pump. Thread J-29525 female adapter into the pressure hose and the male adapter into the gear or pump. Connect J-25323 analyzer hoses to the adapters.
3. If the analyzer has never been used, it will be necessary to bleed the power steering system to remove all the air. Refer to “Bleeding the Power Steering System” in this section. The analyzer gate must be open during this procedure.
4. Add power steering fluid to the pump if required.
5. Run the engine at idle speed with the gate valve open and record flow (A) and pressure (B).
   - If the flow is below 7.4 L/min. (2 gpm), the pump appears to be in need of repair, but continue the test.
   - If the pressure is above 1035 kPa (150 psi), check the hoses for restriction and check the steering gear.
6. Partially close the gate valve to build 4278 kPa (620 psi). Record the flow (C).
   - If the flow (C) drops more than 3.7 L/min. (1 gpm) under flow (A), disassemble the pump and replace the ring, rotor, and vanes. If the pressure plates are worn or cracked, replace them. Replace all O-ring seals when reassembling the pump. Continue the test.
7. Completely close and partially open the gate valve three times (do not allow the valve to remain closed for more than 5 seconds). Record the “gate closed” pressure (D).
8. Check the pressure specifications, at the end of this section for the correct pump model, and if the pump pressure recorded is 690 kPa (100 psi) lower than the minimum specification listed, replace the flow control valve in the pump. If the pressure recorded is above the maximum specification listed, the flow control valve in the pump should be removed and cleaned or replaced. If the system is exceptionally dirty, both the steering gear and pump must be completely disassembled and cleaned before reassembly.
9. Increase the engine speed from idle to about 1500 rpm. Record the flow (E).
   - If flow (E) varies more than 1 gpm from flow (A), then the flow control valve should be removed and cleaned or replaced, the same as in step B.
10. Have the steering wheel turned into the left and then right corner tightly against the wheel stops. Record the pressure and flow (F).
   - Pressures developed in both corners should be nearly the same as the maximum pump output (D). At the same time the flow should drop below 1.85 L/min. (0.5 gpm).
   - If the pressure does not reach maximum output or the flow does not drop below the specified value, excessive internal leakage is occurring. Remove and disassemble the steering gear and remove the control valve. Repair the steering gear as outlined in the Unit Repair Manual.
11. Have the steering wheel turned slightly in both directions and release quickly while watching the pressure gage. The needle should move from the normal back pressure reading and snap back as the wheel is released. If it comes back slowly, or sticks, the rotary valve in the steering gear is sticking. Remove, disassemble and clean the rotary valve. If the system contains a lot of dirt and foreign material, disassemble the pump, gear, clean and reassemble.
12. If the problem still exists, the steering and front suspension must be thoroughly examined. Refer to “Diagnosis of Power Steering System” in this section.

POWER STEERING SYSTEM ON-VEHICLE SERVICE

MAINTENANCE

The hydraulic system should be kept clean and at regular intervals the pump steering fluid level in the reservoir should be checked and fluid added when required. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B) of this manual for type of fluid to be used and intervals for filling.

If the system contains some dirt, flush it as detailed later in this section. If it is exceptionally dirty, both the pump and the gear must be completely disassembled before further usage.

All tubes, hoses, and fittings should be inspected for leakage at regular intervals. Fittings must be tight. Make sure the clips, clamps and supporting tubes and hoses are in place and properly secured.

Inspect the hoses with the wheels in the straight-ahead position, then turn the wheels fully to the left and right, while observing the movement of the hoses. Correct any hose contact with other parts of the vehicle that could cause chafing or wear.

Power steering hoses and lines must not be twisted, kinked or tightly bent. The hoses should have sufficient natural curvature in the routing to absorb movement and hose shortening during vehicle operation.

Air in the system will cause spongy action and noisy operation. When a hose is disconnected or when fluid is lost, for any reason, the system must be bled after refilling. Refer to “Bleeding the Power Steering System” in this section.

PUMP BELT TENSION ADJUSTMENT

When adjusting a power steering pump belt, never pry against the pump reservoir or pull against the filler neck. Two systems are used for belt adjustment. On some models, the pump is loosened from the bracket and
moved outward to increase the tension. On other models, a half-inch square drive hole is located in the bracket, and this hole is used to rotate the pump-and-bracket assembly outward to increase belt tension.

Adjust

Tool Required:
J-23600-B Belt Tension Gage.
1. Place belt tension gage, J-23600-B or equivalent, midway between the pulleys on drive belts being checked.
   • Power steering pump driven by a single belt.
     - Loosen the pump attaching bolts and adjust the belt to correct tension by moving the pump outward, away from the engine.
     - Tighten finger tight all pump mounting bolts and remove the pry bar.
     - Tighten all pump mounting bolts. Refer to “Power Steering Pump Replacement” in this section.
   • Inspect belt tension and remove the belt tension gage.
2. Loosen the pivot bolt and pump brace adjusting nuts.

NOTICE: Do not move the pump by prying against the reservoir or by pulling on the filler neck, or damage may occur.
3. Move the pump, with the belt in place until the belt is tensioned to specifications. Refer to ENGINE COOLING (SEC. 6B1).
4. Tighten the pump bracket adjusting nut and the pivot bolt nut. Refer to “Power Steering Pump Replacement” in this section.
5. Inspect the belt tension and remove the belt tension gage.

FLUID LEVEL ADJUSTMENT

1. Run the engine until the power steering fluid reaches normal operating temperature, about 80°C (170°F), then shut the engine off.
2. Remove the reservoir cap and check the fluid level on the dipstick. On models equipped with a remote reservoir, the fluid level should be about 12.7 to 25.4 mm (1/2 to 1-inch) from the top when the wheels are in full left turn position.
3. If the fluid level is low, add power steering fluid (GM #1050017 or equivalent) to the proper level and install the reservoir cap.
4. When checking the fluid level after the steering system has been serviced, air must be bled from the system. Refer to “Bleeding the Power Steering System” in this section.

BLEEDING THE POWER STEERING SYSTEM

When a power steering pump or gear has been installed, or an oil line has been disconnected, the air that has entered the system must be bled out before the vehicle is operated. If air is allowed to remain in the power steering fluid system, noisy and unsatisfactory operation of the system may result. Bleed air from the hydraulic system as follows:

- When bleeding the system, and any time fluid is added to the power steering system, be sure to use only power steering fluid as specified in MAINTENANCE AND LUBRICATION (SEC. 0B).
1. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
2. Start the engine and let it run for a few seconds. Then turn the engine off.
3. Add fluid if necessary.
4. Repeat the above procedure until the fluid level remains constant after running the engine.
5. Raise the front end of the vehicle so that the wheels are off the ground.
6. Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops.
7. Add power steering fluid if necessary.
8. Lower the vehicle and turn the steering wheel slowly from lock to lock.
9. Stop the engine. Check the fluid level and refill as required.
10. If the fluid is extremely foamy, allow the vehicle to stand a few minutes and repeat the above procedure.

Inspect

- Belt for tightness.
- Pulley for looseness or damage. The pulley should not wobble with the engine running.
- Hoses so they are not touching any other parts of the vehicle.
- Fluid level and fill to the proper level.
- Fluid for air and if present attempt to bleed the system.

FLUSHING THE POWER STEERING SYSTEM

1. Raise the front end of the vehicle off the ground until the wheels are free to turn.
2. Remove the fluid return line at the pump inlet connector and plug the connector port on the pump. Position the line towards a large container to catch the draining fluid.
3. While an assistant is filling the reservoir with new power steering fluid, run the engine at idle. Turn the steering wheel from stop to stop. DO NOT contact wheel stops or hold the wheel in a corner or fluid will stop and the pump will be in pressure relief mode. A sudden overflow from the reservoir may develop if the wheel is held at a stop.
4. Install all the lines, hoses and components (if removed) on the vehicle. Fill the system with new power steering fluid and bleed the system as described in “Bleeding The Power Steering System.” Operate the engine for about 15 minutes. Remove the pump return line at the pump inlet and plug the connection on the pump. While refilling the reservoir, check the draining fluid for contamination. If foreign material is still evident, replace all lines,
disassemble and clean or replace the power steering system components. Do not re-use any drained power steering fluid.

**STEERING GEAR HIGH POINT CENTERING**

1. Set the front wheels in the straight ahead position. This can be checked by driving the vehicle a short distance on a flat surface.
2. With the front wheels set straight ahead, check the position of the mark on the wormshaft designating steering gear high point. This mark should be at the top side of the shaft at the 12 o'clock position and lined up with the mark in the coupling lower clamp.
3. On R, G and P models except P30(00)FS3, if the steering gear has been moved off high point when setting the wheel in the straight ahead position, loosen the adjuster tube clamps on both the left and right hand tie rods. Then turn both adjuster tubes an equal number of turns in the same direction to bring the gear back on high point.

**R, V And P300(32) Models**

- **Install or Connect (Figures 7, 8, 10, 11, and 12)**

  **NOTICE:** For steps 2, 3 and 4 see “Notice” on page 3B3-1.

  1. Flexible coupling onto the steering gear stub shaft.
     - Align the flat in the coupling with the flat on the shaft.
     - Push the coupling onto the stub shaft until the coupling reinforcement bottoms against the end of the shaft.
  2. Pinch bolt into the split clamp. The pinch bolt must pass through the shaft undercut.

  **Tighten**
  - Pinch bolt to 42 N·m (31 ft. lbs.).
  - Place the steering gear into position, guiding the coupling bolts into the proper holes in the shaft flange.

  3. Steering gear to frame bolts. Torque to “Specifications” at the end of this section.
  4. Coupling flange nuts and washers. The coupling alignment pins should be centered in the flange slots.

  **Tighten**
  - Coupling flange nuts to 27 N·m (20 ft. lbs.). Maintain a coupling to flange dimension of 6.4 to 9.5 mm (0.250 to 0.375-inch).

  5. Pitman arm. Refer to STEERING LINKAGE (SEC. 3B1). Remove the plugs and caps from the steering gear and hoses.
  6. Hoses to the steering gear. Torque hose fittings to “Specifications” at the end of this section.

**G And P Models**

- **Install or Connect (Figures 9, 10, 11, and 12)**

  **Install or Connect (Figures 9, 10, 11, and 12)**

  **POWER STEERING GEAR REPLACEMENT**

- **Remove or Disconnect (Figures 7, 8, 9, 10, 11, and 12)**
  - Place a drain pan below the steering gear.
  1. Battery ground cable.
  2. Hoses from the steering gear. Raise the hose up to prevent oil drainage. Cap or tape the ends of the hose and gear fittings to prevent the entrance of dirt.
  - Remove the flexible coupling to steering shaft flange bolts (C, K and P300(32) models).
  - Remove the lower universal joint pinch bolt. Mark the relationship of the universal yoke to the stub shaft (G and P models).
  3. Pitman arm. Refer to STEERING LINKAGE (SEC. 3B1).
  4. Steering gear frame bolts and the steering gear.
  - Tap lightly, using a soft mallet, on the flexible coupling to remove the coupling from the steering gear stub shaft (R, V, and P300(32) models).
**PITMAN SHAFT SEAL REPLACEMENT**

**Remove or Disconnect**

Tools Required:
- J-29107 Pitman Arm Puller.
- J-4245 Internal Snap Ring Pliers.

1. Mark the position of the pitman arm to the pitman shaft. Remove the pitman arm using J-29107. Refer to STEERING LINKAGE (SEC. 3B1).
2. Position a drain pan under the steering gear.
3. Start the engine and full turn the steering wheel to the left-turn position for one or two seconds at a time. This will force the pitman shaft seals and washers out of the housing.
4. Stop the engine.
5. Pitman shaft seals and washers from the pitman shaft.

**Inspect**
- Pitman shaft seal surfaces for roughness or pitting. If pitted, replace the shaft.
- Housing for burrs. Remove the burrs before installing the new seals.

**Clean**
- Pitman shaft and seal areas using a crocus cloth.

**Install or Connect**

Tools Required:
- J-6219 Steering Gear Pitman Shaft Oil Seal Installer.
- J-4245 Internal Snap Ring Pliers.

- Lubricate the new seals with power steering fluid.
- Apply a single layer of tape to the pitman arm shaft to avoid damaging the seals.

1. Single lip seal and washer use J-6219. Install far enough to provide clearance for the remaining seal, washer and retaining ring. DO NOT allow the seal to bottom on the end of the counter bore.
2. Double lip seal and washer use J-21553.
4. Pitman arm. Refer to STEERING LINKAGE (SEC. 3B1).

**STEERING GEAR ADJUSTMENTS**

**Important**
- Before any adjustments are made to the steering gear, refer to "Diagnosis of Power Steering System" for reviewing the possible steering system problems.

The steering gear adjustment is made only as a correction and not as a periodic adjustment. Adjusting the steering gear in the vehicle is NOT recommended for two reasons:

1. The complexity involved in adjusting the worm thrust bearing preload.
2. The friction effect provided by the hydraulic fluid in the steering gear.

For proper adjustment, remove the steering gear from the vehicle. Drain the power steering fluid from the gear. Mount the gear in a vise and make the following adjustments.

The steering gear requires two adjustments which are: the worm thrust bearing preload and the pitman shaft over-center preload adjustment.

The worm thrust bearing preload is controlled by the amount of compression force exerted on the conical worm bearing thrust races by the adjuster plug.

The pitman shaft over-center preload is controlled by the pitman shaft adjuster screw which determines the clearance between the rack piston and the pitman shaft sector teeth.

**Important**
- Adjust the worm thrust bearing preload first, then adjust the pitman shaft over-center preload.

**Worm Bearing Preload**

**Adjust (Figures 1, 2, 13, 14, 15, 16, and 17)**

- Tool Required:
  - J-7624 Adjustable Spanner Wrench.

1. Loosen and remove the adjuster plug nut (6) (figure 13).
2. Turn the adjuster plug (3) in (clockwise), using J-7624, until the plug and thrust bearing are firmly bottomed in the housing.

**Tighten**
- Adjuster plug to 27 N·m (20 ft. lbs.).
3. Place an index mark on the housing even with one of the holes in the adjust plug (figure 14).
4. Measure back (counterclockwise) 4.7-6.3 mm (3/16-1/4-inch) from the index mark and mark the housing (figure 15).

5. Rotate the adjuster plug back (counterclockwise) until the hole in the plug is aligned with the second mark on the housing (figure 16).
6. Install the adjuster plug nut (6).
Tighten

- Nut to 110 N·m (81 ft. lbs.). Be sure the adjuster plug does not turn when tightening the nut.

7. Use a inch-pound torque wrench and a 12-point deep socket to measure the required torque to turn the stub shaft (4). Take the reading with the handle of the torque wrench near the vertical position. Turn the stub shaft to the right stop and then back (counterclockwise) ¼ turn at an even rate (figure 17). Record the torque reading.

8. The torque required to turn the stub shaft should be 0.45-1.13 N·m (4-10 in. lbs.). If the reading is above or below the specified torque; the adjuster plug may not be tightened properly or may have turned when the adjuster plug nut was tightened, or the thrust bearings and races (22) may be damaged.
5. Adjust over-center drag torque by loosening the adjuster screw jam nut (17) and turning the pitman shaft adjuster screw (79) clockwise until the correct drag torque is obtained.

- On new steering gears (under 400 miles), add 0.6-1.2 N·m (6-10 in. lbs.) torque to the previously measured worm bearing preload torque but do not exceed a total steering gear preload of 2 N·m (18 in. lbs.).
- On used steering gears (400 miles or more) add 0.5-0.6 N·m (4-5 in. lbs.) torque to the previously measured worm bearing preload torque but do not exceed a total steering gear preload of 1.5 N·m (14 in. lbs.).

Tighten
- Adjuster screw jam nut (17) to 47 N·m (35 ft. lbs.).

6. Install the steering gear. Refer to “Steering Gear Installation” in this section.

7. Fill the pump reservoir with power steering fluid and bleed the system. Refer to “Bleeding the Power Steering System” in this section.

POWER STEERING PUMP REPLACEMENT

Remove or Disconnect (Figures 21, 22, 23, 24, 25, 26, 27, and 28)

Tool Required:

- Place a drain pan below the pump.
- Battery ground cable.
- Hoses at the pump. Raise the hose up to prevent drainage of the oil. Cap or tape the ends of the hose and pump to prevent the entrance of dirt.
- On models with remote reservoir, disconnect the reservoir hose at the pump. Cap the hose pump fittings.
- Loosen the pump adjusting bolts and nuts.
- Pump belt.

4. Pump adjusting bolts, nuts and brackets.
5. Pump assembly.
6. Pulley from the pump.
   - Install J-29785-A. Be sure the pilot bolt bottoms in the pump shaft by turning the nut to the top of the pilot bolt.
   - Hold the pilot bolt and turn the nut counterclockwise (figure 28).

Install or Connect (Figures 21, 22, 23, 24, 25, 26, 27, and 28)

Tool Required:
- J-25033-B Power Steering Pump Pulley Installer.

1. Brackets to the pump.
2. Pulley to the pump.
   - Place pulley on the end of the pump shaft and install J-25033-B. Be sure the pilot bolt bottoms in the shaft by turning the nut to the top of the pilot bolt.
   - Hold the pilot bolt and turn the nut clockwise (figure 28).

- On models equipped with a remote power steering pump reservoir fill the pump housing with as much fluid as possible before mounting.
3. Pump assembly and attaching parts loosely to the engine.
4. Power steering hoses to the pump. Hoses installed out of position may be subjected to chafing or other abuses during sharp turns. Refer to “Power Steering Hoses” in this section.

Important
- Do not start the engine with any power steering hose disconnected. After connecting the power steering hoses make sure there is clearance between the hoses and the drive belt, sheet metal or any other components where hose rub or interference could result.
- Fill the reservoir. Bleed the pump by turning the pulley backwards (counter-clockwise as viewed from the front) until the air bubbles cease to appear.

5. Pump belt over the pulley.

Adjust
- Belt tension. Refer to “Pump Belt Tension Adjustment” in this section.
- Fill and bleed the system. Refer to “Bleeding the Power Steering System” in this section.

POWER STEERING HOSES

When either a hose is reinstalled or replaced, the following points are essential:
- Route hoses in the same position they were in before removal (figures 29 through 36).
- Route hoses smoothly, avoid sharp bends and kinking.
- Tighten the pump end hose fitting, gear line fitting, and booster line fitting to specifications. Refer to “Specifications” at the end of this section.
After hoses are installed, check for leaks while the system is being bled. Refer to “Bleeding the Power Steering System” in this section.

**NOTICE:** Do not start the engine with any power steering hose disconnected, or damage to the components could occur.

STEERING COLUMN

The following “Notice” applies to one or more steps in the assembly procedure of components in this portion of this manual as indicated at appropriate locations by the terminology “See NOTICE on page 3B4–1 of this section.”

NOTICE: All steering column fasteners are important attaching parts in that they could affect the performance of vital components and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Torque values must be used as specified during reassembly to assure proper retention of all parts.

DESCRIPTION

The locking energy absorbing steering column includes three important features in addition to the steering function:

1. The column is energy absorbing, designed to compress in a front-end collision to minimize the possibility of injury to the driver of the vehicle.
2. The ignition switch and lock are mounted on the column.
3. With the column mounted lock, the ignition, steering and gearshifting operation can be locked to inhibit theft of the vehicle.

The column may be disassembled and reassembled. To insure the energy absorbing action, it is important that the specified screws, bolts and nuts be used only as designated and that they are tightened to the specified torque.

When the column is removed from the vehicle, such actions as a sharp blow on the end of the steering shaft or shift lever, leaning on the column assembly, or dropping of the assembly could shear or loosen the plastic fasteners that maintain column rigidity.

| Steering Column Will Not Lock In Any Tilt Position (Tilt Column) | 1. Lock shoe grooves may have burrs or dirt.  
2. Lock shoe spring is weak or broken.  
3. Lock shoe seized on its pivot pin. | 1. Replace lock shoes and clean the grooves.  
2. Replace the spring.  
3. Replace both lock shoes. |
| Noise When Tilting The Column (Tilt Column) | 1. Tilt spring rubbing in the housing.  
2. Tilt bumpers are worn. | 1. Lubricate.  
2. Replace the tilt bumpers. |
| Steering Wheel Fails To Return To The Top Tilt Position (Tilt Column) | 1. Pivot pins are bound up.  
2. Wheel tilt spring is faulty.  
3. The turn signal switch wires are too tight. | 1. Replace the pivot pins.  
2. Replace the spring.  
3. Reposition the wires. |

| **Hazard Signal Lights Will Not Flash—Turn Signal Functions Normally** | 1. Blown fuse.  
2. Inoperative hazard warning flasher.  
3. Loose chassis to column connection.  
4. Disconnect column to chassis connector. Connect new switch into system without removing old. Depress the hazard warning button and observe the hazard warning lights. If they now work normally, the turn signal switch is faulty.  
5. If the lights do not flash, check wiring harness “K” lead (brown) for open between hazard flasher and harmonica connector. If open, fuse block is faulty. | 1. Replace fuse and check operation.  
2. Replace the hazard warning flasher.  
3. Connect securely and check operation.  
4. Replace the turn signal switch.  
5. Replace fuse block. Refer to SEC. 8B (CHASSIS ELECTRICAL) in this manual. |
| **Tone Alarm Does Not Sound With Key Fully Inserted In Lock Cylinder With Driver’s Door Open** | 1. Loose connection at the tone alarm.  
2. Voltage not available to the tone alarm.  
3. Faulty tone alarm.  
4. Door jamb switch on the driver’s side is maladjusted or inoperative.  
5. Short in the chassis wiring.  
6. Short or fault in the signal switch wiring.  
7. Chips, burrs, foreign material is preventing actuator tip function. NOTICE: Key must be removed or the cylinder in the “run” position before removing the lock cylinder.  
8. Faulty lock cylinder.  
9. Chips, foreign material affecting the tone alarm switch operation.  
10. Damaged or broken tone alarm switch.  
11. Inoperative tone alarm switch (switch appears good but will not make the tone alarm switch function check).  
12. Tone alarm switch contact gap is too large. | 1. Connect securely.  
2. Check the continuity of the chassis wiring and repair as required.  
3. Replace the tone alarm.  
4. Adjust or replace as required.  
5. Check by separating chassis to column connector. Connect E and F female contacts on the chassis side (bent paper clip will work). If tone alarm sounds, continue diagnosis. If not, locate and repair chassis wiring.  
6. Connect male E and F contacts of connector with the jumper. Check buzzer switch pads with the ohmmeter. If contact is made, function is normal. If not, replace the signal switch.  
7. Remove chips and burrs. Reassemble and check.  
8. With the lock cylinder out (refer to “Notice” under step 7), fully insert and remove the key. The actuator should extend and retract smoothly. Total expansion of tip should be 1.25 mm (0.050 inch). If not, replace the lock cylinder.  
9. Remove and clean as required—reassemble and check.  
10. Replace the tone alarm switch.  
11. Connect the ohmmeter leads to the tone alarm switch probes. Press on the actuator pad until the interior points contact. If contact is not made, replace the tone alarm switch.  
12. Reset the contact gap. |

If the fault has not yet been isolated and repaired, connect ohmmeter to the tone alarm switch probes. Fully insert and remove the key from the lock cylinder. If contact is made with the key in, and is broken with it out, the function is normal. Retrace the diagnostic steps. If contact is not made, the fault is in the lock cylinder or tone alarm switch.</td>
<td>13. With the fault isolated in the column, disassemble the upper end of the column until the signal switch mounting screws have been removed. Lift the switch and check the probes of the tone alarm switch to ensure good contact with the pads in the signal switch. Bend the probes, if required, then reseat the signal switch and install the three screws. Check the function. 14. Setting the contact gap. Press a 0.75 mm (0.030 inch) wire type spark plug gap wire with flat piece of stock on the actuator pad. If contact is not made, adjust switch until positive contact is made (use ohmmeter). With positive contact at 0.75 mm (0.030 inch) use a 0.65 mm (0.025 inch) plug gap wire beneath the flat stock. No contact should occur. Adjust. When the switch will make contact with the 0.75 mm (0.030 inch) wire and not with the 0.65 mm (0.025 inch) wire, the tone alarm switch is set at the low limit.</td>

SHIFTER SHAFT
Separation of the shifter shaft sections will be internal and cannot be visually identified. Hold lower end of the "shifter shaft" and move the "shift lever" on the column through its ranges and up and down. If there is little or no movement of the "shifter shaft," the plastic joints are sheared.

STEERING SHAFT
If the steering shaft plastic pins have been sheared, the shaft will rattle when struck lightly from the side and some lash may be felt when rotating the steering wheel while holding the rag joint. If the steering shaft pins are sheared due to minor collision without serious damage to other components, the vehicle can be safely steered; however, steering shaft replacement is recommended.

COLUMN JACKET
Inspect the jacket section of the column for looseness, and/or bends.

COLUMN SUPPORT BRACKET
Damage in this area will be indicated by separation of the mounting capsules from the bracket. The bracket will have moved forward toward the entire compartment and will usually result in collapsing of the jacket section of the steering column.

STEERING COLUMN FOR ACCIDENT DAMAGE
NOTICE: Vehicles involved in accidents resulting in frame damage, major body or sheet metal damage, or where the steering column has been impacted may also have a damaged or misaligned steering column.

Inspect (Figures 1 through 3)
1. Capsules on the steering column bracket assembly. The capsules must be within 1.59 (1/8 inch) from the bottom of the slots (figure 1). If not, the bracket should be replaced.

A. Capsules must be within 1.59 mm (1/8") from bottom of slots. If not, replace bracket assembly.
B. The bolt head must not contact surface "B." If contact is made, the capsule shear load will be increased—Replace bracket.

Figure 1—Steering Column Collapse Inspection
2. Contact surface (figure 1). The bolthead must not contact surface "B" or the shear load would be increased. If contact is made, replace the bracket.
3. Shift lever operation on vehicles with automatic transmission and column shift. If the shift lever is able to move to the "Park" position without raising the lever, the upper shift tube plastic bearing is broken.
4. Jacket collapse. Measure the jacket collapse dimensions, depending on the vehicle and steering column, in either of the following ways (figure 2):
   • Measure from the end of the bearing assembly to the lower edge of the upper jacket (C).
C. 346.7 mm (13.64 inches) RV MODEL (Tilt Column)
D. 72 mm (2.8 inches) RV MODEL (Standard Column-Column Shift)
E. 353 mm (14 inches) RV MODEL (Standard Column-Floor Shift)
F. 81.7 mm (3.21 inches) G MODEL (Tilt Column-Column Shift)
G. 144.9 mm (5.70 inches) G MODEL (Tilt Column-4 Speed)
H. 192 mm (7.5 inches) G MODEL (Standard Column-Column Shift)
J. 80 mm (3.1 inches) G MODEL (Tilt Column-Floor Shift)
K. Inspect for sheared injected plastic in the shift tube.
L. Inspect for sheared injected plastic in the steering shaft.

Figure 3—Steering Column Collapse Inspection

- Measure from the collar on the toe plate flange to the lower edge of the upper jacket (E, G and H).
- Measure from the edge of the back-up switch window to the lower edge of the upper jacket (D, F and J).

If the jacket dimensions are not within specifications, a new jacket must be installed.
- Visually inspect for sheared injected plastic in the shift tube, and the steering shaft (figure 3). If either one or both are sheared, replace with new parts.

5. Any frame damage that could cause a bent steering shaft must have the steering shaft runout checked in the following manner: Remove intermediate shaft. Hold a ruler against the lower end of steering shaft and have the steering wheel rotated. The runout must not exceed 1.59 mm (⅜ inch). A dial indicator may be used instead of a ruler.

STEERING WHEEL REPLACEMENT

Remove or Disconnect (Figure 4)

Tools Required:
J-1859-03 Steering Wheel Puller
1. Battery ground cable.
2. Horn button cap.
3. Retainer and steering wheel nut.
4. Horn lead assembly (some models).
- Mark the relationship of the steering wheel to the steering shaft.
5. Steering wheel. Use J-1859-03 (figure 4). Do not hammer on the puller, or damage could result to the steering column.

Install or Connect (Figure 5)

NOTICE: For step 3 see “Notice” on page 3B4-1.

• Do not misalign the steering wheel more than 25.4 mm (1 inch) from the horizontal centerline (figure 5).
2. Horn lead assembly (some models).
3. Steering wheel nut.
4. Retainer.
5. Horn button cap.
6. Battery ground cable.
FLEXIBLE COUPLING REPLACEMENT

Remove or Disconnect (Figure 6)
1. Coupling to flange bolt nuts and washers (2).
2. Clamp bolt (1).
3. Steering gear frame bolts. Lower the steering gear far enough to remove the flexible coupling.
4. Flexible coupling from the steering gear wormshaft. Tap lightly with a soft mallet.

Install or Connect (Figure 6)

NOTICE: For steps 2, 3 and 4 see "Notice" on page 3B4-1.

1. Flexible coupling onto the steering gear wormshaft. Align the flat on the shaft with the flat in the coupling.
   - Push the coupling onto the wormshaft until the coupling reinforcement bottoms against the end of the worm.
2. Clamp bolt (1) into the split clamp. The bolt must pass through the shaft undercut.

Tighten
- Bolt to 42 N·m (31 ft. lbs.).
- Place the steering gear into position, guiding the flexible coupling bolts into the proper holes in the steering shaft flange.

3. Steering gear and frame bolts.

Tighten
- Bolts to "Specifications" at the end of this section.
4. Coupling to flange bolt nuts and washers (2).
   - The coupling alignment pins should be centered in the flange slots.

Tighten
- Nuts to 27 N·m (20 ft. lbs.).

4. Nuts (10) and clamp (11).
5. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
6. Steering column harness at the connector.
   - Disconnect the neutral-start switch and back-up lamp switch connectors (some models). Refer to SEC. 8B (CHASSIS ELECTRICAL) in this manual.
7. Transmission indicator cable (some models).
8. Screws (6), upper cover (3), lower cover (5), and seal (4).
9. Screws (7), nuts (8) and bracket (9).
10. Steering column assembly. Rotate the column so the shift lever clears the dash opening.

Install or Connect (Figure 9)

NOTICE: For steps 4 and 12 see "Notice" on page 3B4-1.

1. Plastic spacers onto the flexible coupling alignment pins.
2. Lower end of the steering column through the dash opening.
3. Lower steering shaft flange onto the flexible coupling (13).
4. Flange to coupling washers and nuts (1).

Tighten
- Nuts to 27 N·m (20 ft. lbs.).
- The flexible coupling (13) on manual steering must be installed prior to column installation.
5. Screws (7) and (8) and bracket (9) loosely. Tighten screws and nuts finger tight.
6. Clamp (11) and nuts (10).

Tighten
- Nuts (10) to 24 N·m (18 ft. lbs.).
- Screws (7) and nuts (8) to 30 N·m (22 ft. lbs.).
7. Seal (4) and covers (3, 5) to the dash.
8. Screws (6).
   - Remove plastic spacers from the flexible coupling pins.

Measure
- Pot joint (12) operating angle must not exceed 12 degrees.
- Flexible coupling (13) must not be distorted greater than ±1.5 mm (0.06 inch) due to pot joint bottoming, in either direction.
9. Transmission indicator cable (some models).
10. Transmission control linkage.
11. Connectors to the steering column harness.
   - Connect the neutral-start switch and back-up lamp switch connectors (some models). Refer to SEC. 8B (CHASSIS ELECTRICAL) in this manual.
12. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
14. Battery ground cable.

TURN SIGNAL SWITCH REPLACEMENT

Remove or Disconnect (Figures 11 through 13)

Tools Required:
- J-23653-A Lock Plate Compressor
1. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
2. Instrument panel trim cover.
   - Position a screwdriver blade into the steering shaft lock plate cover slot. Pry up and out to free the cover from the lock plate.
   - Screw the center post of J-23653-A onto the steering shaft as far as it will go. Compress the lock plate by turning the center post nut clockwise. Pry the retaining ring out of the shaft (figure 11). Remove J-23653-A.
Figure 12—Turn Signal Wire Protector Removal

Important

- If the column is being disassembled on a bench, the shaft could slide out of the end of the mast jacket when the snap ring is removed.

3. Lock plate.
4. Turn signal lever screw and lever.
6. Hazard warning knob. Press the knob inward and then unscrew.
7. Turn signal mounting screws.
- Pull the switch connector out of the bracket on the jacket and feed switch connector through column support bracket and pull switch straight up, guiding the wiring harness through the column housing and protector.
8. Wire protector. Pull downward out of the column with pliers using the tab provided (figure 12).
- Position the turn signal and shifter housing in the "low" position. Remove the harness cover by pulling toward the lower end of the column, be careful not to damage the wires (tilt column).
9. Turn signal switch. Pull the switch straight up, guiding the wiring harness and cover through the column housing (figure 13).

Install or Connect (Figure 14)

Tools Required:
J-23653-A Lock Plate Compressor

Figure 14—Retaining Ring Installation

Important

- Use only the specified screws, bolts and nuts at assembly. The use of overlength screws could prevent a portion of the assembly from compressing under impact.
- On non-tilt columns, be sure the wiring harness is on the protector. Feed the connector and cover down through the housing and under the mounting bracket.
- On tilt columns, feed the connector down through the housing and under the mounting bracket. Install the cover on the harness.
1. Turn signal mounting screws.
- Clip the connector to the bracket on the jacket.
2. Instrument panel trim plate.
3. Hazard warning knob.
4. Turn signal lever and screws.
- Put the turn signal switch in the "Neutral" position. Pull "out" on the hazard warning knob.
5. Washer, upper bearing preload spring and cancelling cam onto the upper end of the shaft.
6. Lock plate onto the end of the shaft.
- Screw the center post of J-23653-A onto the steering shaft as far as it will go. Place a NEW retaining ring over the center post. Place the "C" bar over the center post and then compress the lock plate by turning the nut clockwise. Slide the new retaining ring down the tapered center post and into the shaft groove (figure 14). Remove J-23653-A.
7. Cover on the lock plate and snap into position.
8. Steering wheel. Refer to "Steering Wheel Replacement" in this section.

LOCK CYLINDER REPLACEMENT

Remove or Disconnect (Figure 15)

- Place the lock cylinder in the "Run" position.
1. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
2. Turn signal switch. Refer to "Turn Signal Switch Replacement" in this section.
**3B4-18 STEERING COLUMN**

### TONE ALARM SWITCH REPLACEMENT

**Remove or Disconnect**

1. **Steering wheel.** Refer to "Steering Wheel Replacement" in this section.
   - Pull the turn signal switch up far enough to allow access to the tone alarm switch. Refer to "Turn Signal Switch Replacement" in this section.
   - The tone alarm switch may be removed without removing the lock cylinder. The lock cylinder must be in the "Run" position.

2. **Tone alarm switch assembly.**
   - Pull the tone alarm switch straight out of the housing using a paper clip or similar tool. A flat spring wedges the switch toward the lock cylinder.

**Important**

- Be careful not to let the flat spring fall down into the housing and do not pull on the switch contacts or plastic material of the switch when removing.

**Install or Connect**

1. **Tone alarm switch to the spring clip with the formed end of the clip around the lower end of the switch.** The spring is bowed away from the switch.
   - Lay the spring on the switch opposite the contacts.

2. **Tone alarm switch and spring into the hole with the contacts toward the lock cylinder bore.**

3. **Turn signal switch.** Refer to "Turn Signal Switch Replacement" in this section.

4. **Steering Wheel.** Refer to "Steering Wheel Replacement" in this section.

### IGNITION SWITCH REPLACEMENT

The ignition switch is mounted on top of the column jacket near the front of the dash. For anti-theft reasons, the switch is located inside the channel section of the brake pedal support.

The switch is actuated by a rod and rack assembly. A portion of the rack is toothed and engages a gear on the end of the lock cylinder. This enables the rod and rack to be moved axially (with respect to the column) to actuate the switch when the lock cylinder is rotated.

**Remove or Disconnect**

- Lower the steering column. Refer to "CK Model or G Model Steering Column Replacement" in this section. It is not necessary to remove the steering wheel.

**Important**

- Properly support the steering column if it is not removed from the vehicle.

- Put the ignition switch in the "Lock" position.
• If the lock cylinder was removed, the actuating rod to the switch should be pulled up until there is a definite stop, then moved down one detent, which is the “Lock” position.

1. Two ignition switch screws.
2. Ignition switch assembly.

Install or Connect (Figure 16)
• Put the ignition switch in the “Lock” position (figure 16).
1. Activating rod into the ignition switch.
2. Ignition switch and screws to the column.
3. Steering column assembly. Refer to “Steering Column Replacement” in this section.

STANDARD STEERING COLUMN UNIT REPAIR (R, V AND G MODELS)

Remove or Disconnect
• Steering column assembly. Refer to “RV or G Model Steering Column Replacement” in this section.

Disassemble (Figures 17 through 25)
1. Dash panel bracket and screws from the column.
2. Clamp the steering column in a vise.
   • Clamp at the lower end of the jacket.
3. Steering wheel. Refer to “Steering Wheel Replacement” in this section.
4. Turn signal switch. Refer to “Turn Signal Switch Replacement” in this section.
5. Lock cylinder. Refer to “Lock Cylinder Replacement” in this section.
6. Tone alarm switch, if it needs to be serviced. Refer to “Tone Alarm Switch Replacement” in this section.

Important
• The buzzer switch does not have to be removed to remove the upper bearing housing.
7. Ignition switch. Refer to “Ignition Switch Replacement” in this section.
8. Shift lever pivot pin and lever. (Column Shift Models).
10. Screws attaching the turn signal and ignition lock housing.
11. Housing assembly (figure 23).
12. Bushing and retainer from the lower side of the housing.
13. Ignition switch actuating rod, rack assembly, rack preload spring, shaft lock bolt and spring assembly from the housing.

15. Ignition switch actuator sector through the lock cylinder hole by pushing firmly on the block tooth of the sector with a blunt punch or screwdriver (figure 24).
16. Gear shift lever housing and shroud from the jacket assembly.
   • On floor shift models remove the transmission control lock tube housing and shroud.
17. Shift lever spring from the gear shift lever housing.
   • On floor shift models remove the lock tube spring.
18. Steering shaft from the lower end of the jacket assembly.
20. Lower bearing retaining clip (figure 25).

Assemble (Figures 17 through 22, 26 and 27)
• Apply a thin coat of lithium grease to all friction surfaces.

**Figure 18—Standard Steering Column—Column Shift (RV Model)**

1. Sector into the turn signal and lock cylinder housing.
   - Install the sector in the lock cylinder hole over the sector shaft with the tang end to the outside of the hole.
   - Press the sector over the shaft with a blunt tool.

2. Shift lever detent plate onto the housing.

3. Rack preload spring into the housing from the bottom side. The long section should be toward the handwheel and hooks onto the edge of the housing (figure 26).

4. Locking bolt onto the crossover arm on the rack and insert the rack and lock bolt assembly into the housing from the bottom with the teeth up (toward handwheel) and toward the centerline of the column.
   - Align the first tooth on the sector with the first tooth on the rack; if aligned properly, the block teeth will line up when the rack assembly is pushed all the way in.

5. Retainer and bushing.

6. Gear shift housing lower bearing. Insert the bearing from the very end of the jacket.
   - Align the indentations in the bearing with the projections on the jacket (figure 27). If the bearing is not installed correctly, it will not rest on the stops provided.

7. Shift lever spring into the gear shift lever (or lock tube) housing.

8. Housing and shroud assemblies onto the upper end of the mast jacket.
   - Rotate the housing to be sure it is seated in the bearing.

9. Turn signal and lock cylinder housing onto the jacket.
   - The gear shift housing should be in the “Park” position and the rack pulled downward.
   - Seat the turn signal housing and install the four screws.

10. Lower bearing into the adapter assembly.

11. Shift tube assembly into the lower end of the jacket. Rotate until the upper shift tube key slides into the housing keyway.
   - On Automatic and Floor Shift Columns
     - Install the spring and lower bearing adapter assembly into the bottom of the jacket.
     - Hold the adapter in place and install the lower bearing reinforcement and retainer clip. The clip snaps into the jacket and reinforcement slots.

   - On Manual Transmission (Column Shift)
     - Loosely attach the three screws in the jacket and shift tube bearing.
     - Assemble the first reverse lever, lower bearing and adapter assembly into the bottom of the jacket.
     - Hold the adapter in place and install the bearing reinforcement and retaining clip. The clip snaps into the jacket and reinforcement slots.
     - Adjust the lower bearing. Refer to the “Manual Transmission (Column Shift) Lower Bearing Adjustment” in this section.

13. Steering shaft into the column.

15. Ignition switch. Refer to “Ignition Switch Replacement” in this section.

16. Tone alarm switch, if removed. Refer to “Tone Alarm Switch Replacement” in this section.

17. Lock cylinder. Refer to “Lock Cylinder Replacement” in this section.

18. Turn signal switch. Refer to “Turn Signal Switch Replacement” in this section.

19. Steering wheel. Refer to “Steering Wheel Replacement” in this section.

20. Shift lever and pivot pin.
   • Remove the column from the vise.

21. Dash panel bracket and screws to the column.

Install or Connect
• Steering column assembly. Refer to “RV or G Model Steering Column Replacement” in this section.

STANDARD STEERING COLUMN
LOWER BEARING ADJUSTMENT

MANUAL TRANSMISSION (COLUMN SHIFT)

Adjust (Figure 28)

1. Put the transmission in neutral and disconnect the transmission rods.

2. Test for rotational drag by turning the shift lever through the 2–3 shift arc. The drag measured must not be more than 9N (2 lbs.).

3. Loosen the three clamping screws.
   • Increase clearance by sliding the clamping screws in the direction of arrow “B” until the first reverse lever is free of drag (figure 28).
   • Decrease clearance by sliding the clamping screws in the direction of arrow “A” until a slight drag is felt at the first reverse shift lever (figure 28).

4. Install a 0.13 mm (0.005 inch) thick shim between the space and either of the shift levers.

5. Slide the clamping screws in the direction of arrow “B” until the system is loose. Slide the screws in the opposite direction until a drag is felt at the first reverse shift lever.

6. Tighten the clamping screws.

7. Remove the shim.

8. Install the transmission rods.

TILT STEERING COLUMN UNIT REPAIR
(R, V AND G MODELS)

 <+> Remove or Disconnect

- Steering column assembly. Refer to "RV or G Model Steering Column Replacement" in this section.

 <+> Disassemble (Figures 29 through 36)

Tools Required:
- J-22635 Lock Shoe and Release Lever Pin Remover and Installer
- J-21854-01 Pivot Pin Remover
- J-23072 Shift Tube Remover

1. Dash panel bracket and screws from the column.
2. Clamp the steering column in a vise.
- Clamp at the lower end of the jacket.
3. Turn signal switch. Refer to "Turn Signal Switch Replacement" in this section.
4. Lock cylinder. Refer to "Lock Cylinder Replacement" in this section.
5. Tone alarm switch, if it needs to be serviced. Refer to "Tone Alarm Switch Replacement" in this section.

 Important

- The tone alarm switch does not have to be removed to remove the upper bearing housing.
6. Ignition switch. Refer to "Ignition Switch Replacement" in this section.
7. Tilt release lever.
8. Shift lever pivot pin and lever.
9. Housing cover screws and housing cover.
- Install the tilt release lever and place the column in the "up" position.
10. Tilt lever spring retainer, spring and guide. Use a screwdriver to turn the retainer until it aligns with the grooves in the housing then remove the retainer.
11. Pot joint to steering shaft clamp bolt and remove the intermediate shaft and pot joint assembly (RV Model).
12. Upper bearing inner race and seat. Push the upper steering shaft in enough to remove the race and seat.
13. Lower bearing retainer clip.
14. Bearing reinforcement, bearing and bearing adapter assembly from the lower end of the mast jacket.
15. Upper bearing housing pivot pins. Use J-21854-01 (figure 33).
   • Install the tilt release lever and disengage the lock shoes.
16. Bearing housing by pulling upward to extend the rack full down, and then moving the housing to the left to disengage the ignition switch rack from the actuator rod.
17. Steering shaft assembly from the upper end of the column.
18. Steering shaft by removing the centering spheres and the anti-lash spring.
19. Transmission indicator wire, if so equipped.
20. Bearing housing support to gearshift housing screws and remove the bearing housing support.
21. Ignition switch actuator rod.
22. Shift tube retaining ring and washer.

**NOTICE:** When removing the shift tube, be sure to guide the lower end through the slotted opening in the mast jacket. If the tube is allowed to interfere with the jacket in any way, damage to the tube and jacket could result.

• Install J-23072 into the lock plate, making sure that the tool screws have good thread engagement in the lock plate. Then, turning the center screw clockwise, force the shift tube from the housing (Figure 34). Remove the shift tube (transmission control lock tube on floor shift models) from the lower end of the mast jacket. Remove J-23072.

23. Lock plate and washer.
   • Slide the lock plate out of the jacket notches by tipping it down toward the housing hub and sliding it under the jacket opening.
24. Shift lever housing from the mast jacket. (Transmission control lock tube housing on floor shift models).
   • Disassemble the bearing housing as follows:
25. Tilt lever opening shield.
26. Lock bolt spring. Remove the retaining screws and move the spring clockwise to remove it from the bolt (figure 35).
27. Snap ring from the sector drive shaft.
   • With a small punch, lightly tap the drive shaft from the sector (figure 36).
28. Drive shaft, sector and lock bolt.
29. Rack and rack spring.
30. Tilt release lever pin. Use J-22635.
31. Release lever and spring.

**Important**

• To relieve the load on the release lever, hold the shoes inward and wedge a block between the top of the shoes (over slots) and bearing housing.
32. Lock shoe retaining pin. Use J-22635.
33. Lock shoes and springs.
34. Bearings from the bearing housing only if they are to be replaced.
   • Remove the separator and balls from the bearings.

• Place the housing on a work bench and with a pointed punch against the back surface of the race, carefully hammer the race out of the housing until a bearing puller can be used. Repeat for the other race.

**Assemble (Figures 29 through 39)**
Tools Required:
J-23073-01 Shift Tube Installer
J-22635 Lock Shoe and Release Lever Pin Remover and Installer

• If the bearing housing was disassembled, repeat steps 1–9.
• Apply a thin coat of lithium grease to all friction surfaces.
1. Bearings into the bearing housing, if removed.
2. Lock shoe springs, lock shoes and shoe pin in the bearing housing. Use J-22635 or a 4.5 mm (0.180 inch) diameter rod to line up the shoes for pin installation.
3. Release lever, spring and pin.

**Important**

• To relieve the load on the release lever, hold the shoes inward and wedge a block between the top of the shoes (over slots) and bearing housing.
4. Sector drive shaft into the housing.
   • Lightly tap the sector onto the shaft far enough to install the snap ring.
5. Snap ring.
7. Rack and spring. The block tooth on the rack should engage the block tooth on the sector (figure 37).
8. Tilt release lever.
9. Lock bolt spring and retaining screw.

**Tighten**

• Screw to 4 N·m (35 in. lbs.).
10. Shift lever spring into the housing. Wind the spring up with pliers and push it into the housing.
   • On floor shift models, install the plunger and slide the gearshift lever housing onto the mast jacket.
11. Washer and lock plate. Slide the lock plate into the notches in the jacket.

**NOTICE:** Do not push or tap on the end of the shift tube. Be sure that the shift tube lever is aligned with the slotted opening at the lower end of the mast jacket or damage to the shift tube and mast jacket could result.

12. Shift tube into the lower end of the mast jacket.
   • Align the keyway in the tube with the key in the shift lever housing.
   • Install the wobble plate end of J-23073-01 into the upper end of the shift tube far enough to reach the enlarged portion of the tube.
   • Install the adapter over the end of the tool, seating it against the lock plate.

- Place the nut on the threaded end of the tool and pull the shift tube into the housing (figure 38).
- Remove J-23073-01.

13. Bearing support washer and retaining ring. Pull the shift lever housing up far enough to compress the lock plate washer.
14. Bearing support. Align the "V" in the support with the "V" in the jacket.
15. Screws through the support and into the lock plate.
   - Screws to 68 N-m (60 in. lbs.).
   - Align the lower bearing adapter with the notches in the jacket.
16. Adapter into the lower end of the jacket.
17. Lower bearing, bearing reinforcement and retaining clip.
   - Align the retaining clip with the slots in the reinforcement, jacket and adapter.
18. Centering spheres and anti-lash spring in the upper shaft.
19. Lower shaft from the same side of the spheres that the spring ends protrude.
20. Steering shaft assembly into the shift tube from the upper end. Carefully guide the shaft through the shift tube and bearing.
21. Ignition switch actuator rod through the shift lever housing and insert it in the slot in the bearing support.
   - Extend the rack downward from the bearing housing.
22. Bearing housing over the steering shaft.
   - Engage the rack over the end of the actuator rod (figure 39).
   - With the release lever installed, hold the lock shoes in the disengaged positions.
23. Bearing housing over the steering shaft until the pivot pin holes line up.
24. Pivot pins.
   - Place the bearing in the full "up" position.
25. Tilt lever spring guide, spring and retainer.
   - With a suitable screwdriver, push the retainer in and turn clockwise to engage it in the housing.
26. Tilt lever opening shield.
   - Remove the tilt release lever.
27. Turn signal housing and retaining screws.
   - Screws to 5 N-m (45 in. lbs.).
28. Tilt release lever and shift lever.
29. Ignition switch. Refer to "Ignition Switch Replacement" in this section.
30. Tone alarm switch, if removed. Refer to "Tone Alarm Switch Replacement" in this section.
31. Lock cylinder. Refer to "Lock Cylinder Replacement" in this section.
32. Turn signal switch. Refer to "Turn Signal Switch Replacement" in this section.
   - Remove the column from the vise.
   - Align the groove across the upper end of the pot joint with the flat on the steering shaft. Install the pot joint and intermediate shaft assembly to the upper shaft (RV Model).

Tighten

- Screws to 5 N-m (45 in. lbs.).

TURN SIGNAL SWITCH REPLACEMENT

Remove or Disconnect (Figure 40)

Tools Required:
J-22727 Electrical Terminal Remover

1. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
2. Cancelling cam and spring (standard columns).
3. Instrument panel trim plate (some models).
4. Turn signal switch wiring harness at the half-moon connector.
   - Pry the wiring harness protector out of the column retaining slots.
   - Mark the location of each wire in the half-moon connector and then remove each individual wire from the connector. Use J-22727 (figure 40). Insert the tool into the lower end of the connector and push in until the tool bottoms on the connector. Remove the tool and then pull the wire from the connector.
5. Turn signal lever screw and lever.
   - On tilt columns.
     - Remove the PRNDL dial screws, dial and indicator needle. Remove the cap and dial illumination bulb from the housing cover (Automatic Transmission Model).
     - Unscrew and remove the tilt release lever.
     - Remove the turn signal housing cover, using a pulley remover with reversed jaws.
7. Turn signal switch mounting screws.
8. Turn signal switch assembly from the column. Guide the wiring harness through the opening in the shift lever housing.

Install or Connect

- Wrap the ends of the turn signal switch wires with tape and then guide them through the opening at

the lower left hand side of the bearing housing (tilt columns) out the lower end of the shift lever housing and under the dash seal.
- Place the turn signal switch in position.
1. Turn signal switch mounting screws.

Tighten

- Screws to 2.8 N·m (25 in. lbs.).
- On tilt columns.
  - Align the openings in the turn signal switch cover with the proper lever positions. Tap the cover into place using a plastic hammer.
  - Install the tilt release lever.
  - Install the PRNDL dial, pointer, dial illumination bulb and cap (Automatic Transmission Models).

2. Turn signal switch lever and screws.
3. Hazard warning knob.
   - Bend the wire retaining tabs, on each wire in the wiring harness, enough to provide proper retention of the wire in the half-moon connector.
4. Each wire in its marked location in the half-moon connector. Push in until the square part of the clip is flush with the bottom side of the connector.
5. Turn signal switch wiring harness.
6. Wiring harness protector into the column retaining slots.
7. Cancelling cam and spring (non-tilt column).

NOTICE: For step 8 see "Notice" on page 3B4-1.

8. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
9. Instrument panel trim plate (some models).

TILT STEERING COLUMN REPLACEMENT

Remove or Disconnect (Figure 41)

1. Battery ground cable.
2. Transmission control linkage from the column shift tube levers.
3. Nuts and washers that secure the flanged end of the steering shaft to the flexible coupling.
4. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
5. Turn signal wiring harness.
   - On an automatic transmission, disconnect the single wire at the fuse block and unclip it from the parking brake bracket.
6. Screws from the cover of the dash and toe panel assembly.
7. Screws (211) and clamp (210) from the column support bracket.
8. Steering column assembly.
• Lower and then withdraw the column assembly. Rotate the column so the shift lever clears the dash and toe panel assembly.

**Install or Connect (Figures 41 and 42)**

**NOTICE: For steps 4 and 8 see “Notice” on page 3B4-1.**

- Adjust the lower bearing preload. Refer to "Steering Column Lower Bearing Adjustment" in this section.

1. Plastic spacers onto the flexible coupling alignment pins.
2. Lower end of the steering column through the toe panel opening.
3. Lower steering shaft flange onto the flexible coupling.
4. Flange to coupling nuts.
5. Nuts to 27 N·m (20 ft. lbs.).
Align the index slot in the steering column jacket with the protrusion on the column support bracket. Clamp (210) and screws (211) to the column support bracket. Tighten bolts finger tight.
Push the column down until the steering shaft flange bottoms on the plastic spacers on the flexible coupling.

6. Screws (211) to 25 N·m (18 ft. lbs.).
Remove the plastic spacer from the alignment pins.

7. Measure
Coupling assembly dimensions (figure 42).
Raise or lower steering column if necessary.

6. Cover and mounting screws to the dash and toe panel assembly.

7. Turn signal switch wiring harness.
On an automatic transmission, connect the single wire to the fuse block and clip it to the parking bracket.

8. Steering wheel. Refer to "Steering Wheel Replacement" in this section.

10. Battery ground cable.

TILT STEERING COLUMN BEARING HOUSING REPLACEMENT

Remove or Disconnect (Figures 43 through 47)

Tools Required:
J-22635 Lock Shoe and Release Lever Pin Remover and Installer
J-21854-01 Pivot Pin Remover
J-5822 Steering Gear Shaft Main Bearing Cup Remover
J-2619-01 Slide Hammer

1. Battery ground cable.
2. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
3. Turn signal switch. Refer to "Turn Signal Switch Replacement" in this section.
4. On column shift models, use a suitable size punch to drive out the shift lever pivot and remove the shift lever.
5. Install the tilt release lever and place the column in the "up" position.
6. Retainer (230) and spring (232). Use a screwdriver to turn the retainer until it aligns with the grooves in the housing, then remove the retainer and spring.
7. Upper bearing nut (233).
8. Seat (254) and race (255).
9. Housing pivot pins (221). Use J-21854-01 (figure 45).
10. Bearing housing (219). Pull up on the tilt release lever, this will disengage the shoes (224), and remove the housing.
11. Upper and lower bearings (218, 220).
   • Remove the bearing races using J-5822 and J-2619-01 (figure 46).
12. Tilt release lever.

Install or Connect (Figures 43 and 44)

NOTICE: For steps 4 and 11 see "Notice" on page 3B4-1.

• Lubricate the ID of the bearing housing support and install the support and screws.
1. Steering shaft assembly.
   • Lubricate and assemble the centering spheres and spring.
   • Install the spheres into the upper (short) shaft and rotate 90 degrees.
   • Install the lower shaft 90 degrees to the upper shaft and over the centering spheres. Slowly straighten the shafts while compressing the spring.
2. Steering shaft assembly into the housing from the upper end.
3. Lower steering column shaft to the intermediate shaft (pot joint) assembly (269).
4. Clamp (262) bolt (261) and nut (263). The bolt must pass through the shaft undercut.
   • Tighten
   • Bolt to 60 N·m (44 ft. lbs.).
5. Bearing housing (219) assembly.
   • Press the new upper and lower bearing races into the bearing housing.
   • Lubricate and install the bearings into the bearing races.
   • Place the shoe springs in position in the housing. Install each shoe in place and compress the spring in position. Once the shoes are in place, drive in the shoe retaining pin (226).
   • Install the shoe release lever (229), spring (227) and pivot pin (228).
   • Install the tilt release lever.
   • Lubricate the shoes and release lever.
6. Bearing housing assembly to the support (233).
Figure 43—Tilt Steering Column—P(32) Model
• Hold the tilt release lever in the “up” position until the shoes have fully engaged the support.

• Lubricate and install the bearing housing pivot pins (221). Press the pins in flush with the housing.

• Place the housing in the “up” position.

Figure 44—Tilt Steering Column—P(32) Model

7. Spring (232) and retainer (230). Push the retainer into the housing about 5 mm (5/6 inch) and rotate counterclockwise 1/6 turn.

• Lubricate the upper bearing race (255), seat (254) and nut (253).

8. Race (255), seat (254) and nut (253).

• Remove the tilt release lever.

9. Turn signal switch. Refer to “Turn Signal Switch Replacement” in this section.

10. Shift lever and pivot pin. (Column Shift Models).

11. Steering Wheel. Refer to “Steering Wheel Replacement” in this section.

12. Tilt release lever.

Inspect

• Electrical and mechanical functioning of the steering column.
TILT STEERING COLUMN UNIT REPAIR
P(32) MODELS

Remove or Disconnect

- Steering column assembly. Refer to "Tilt Steering Column Replacement" in this section.

Disassemble (Figures 43 and 44)

Tool Required:
J-23072 Shift Tube Remover

1. Clamp the steering column in a vise.
2. Intermediate shaft assembly (270), with the universal joint (pot joint), from the steering column shaft.
3. Bearing retainer clip (245) and reinforcement (246).
4. Bearing (251) and adapter (250).
5. Bearing housing assembly and steering shaft assembly. Refer to "Tilt Steering Column Bearing Housing Replacement" in this section.
6. Shift tube retaining ring (237) and washer (238).
7. Neutral-safety or back-up lamp switch screws and switch. Refer to SEC. 8B (CHASSIS ELECTRICAL) in this manual.
   - Insert the hooked end of the tool into the notch in the shift tube just below the shift lever housing key. Pilot the sleeve over the threaded end of the tool and into the upper end of the shift tube. Force the shift tube out of the housing by turning the nut onto the tool. If the shift tube is not completely free when the nut is bottomed on the threads, complete the removal by hand.
   - On column shift models, guide the lower shift lever through the slotted opening in the column to prevent damage to the tube or column.
9. Lock plate (239) and washer (240). Tip the lock plate downward towards the housing, then remove.
10. Shift lever housing.
   - Remove the shift lever spring by winding the spring up with pliers (Column Shift Models).
11. Dash panel seal from the column jacket.

Assemble (Figures 43 and 44)

Tools Required:
J-23073-01 Shift Tube Installer

1. Dash panes seal.
2. Steering shaft assembly and bearing housing assembly. Refer to "Tilt Steering Column Bearing Housing Replacement" in this section.
3. Washer (240) and lock plate (239).
   - Apply lithium grease to the lock plate and the upper end of the shift tube.
4. Shift tube (249) and seal (248) into the lower end of the column. Do not hammer or force the shift tube.
   - Align the keyway in the shift tube with the key in the shift lever housing and install the shift tube using J-23073-01 (figure 38).
   - The shift lever housing key must bottom in the shift tube slot.
5. Neutral-safety or back-up lamp switch and screws. Refer to SEC. 8B (CHASSIS ELECTRICAL) in this manual.
6. Washer (238) and retaining ring (237). Pull up on the shift lever housing when installing the washer and retaining ring.
   - Seat the retaining ring in both slots in the shift tube.
7. Steering shaft assembly and bearing housing assembly. Refer to "Tilt Steering Column Bearing Housing Replacement" in this section.

Install or Connect

- Steering column assembly. Refer to "Tilt Steering Column Replacement" in this section.

STANDARD STEERING COLUMN REPLACEMENT

Remove or Disconnect (Figure 48)

1. Battery ground cable.
2. Transmission control linkage from the column shift tube levers (Column Shift Models).
3. Upper universal joint pinch bolt from the intermediate shaft. Mark the relationship of the universal yoke to the steering shaft.
4. Nut (282), bolt (280) and clamp (281). Slide the clamp down the column.
5. Screws (277) from the cover (278) and seal (279). Slide the cover and seal up the column.
6. Steering wheel. Refer to "Steering Wheel Replacement" in this section.
7. Turn signal wiring harness.
   - On an automatic transmission, disconnect the conductor tube at the instrument panel.
8. Bolts (275) and clamp (276) from the column support bracket.
9. Bolt, nut and outer brace (283) from the column support bracket (P200 + 300 (42) models).
10. Steering column assembly.
Figure 48—Steering Column Installation—P(42) Model

- Lower and then withdraw the column assembly. Rotate the column so the shift lever clears the dash and toe panel assembly.

**Install or Connect (Figure 48)**

**NOTICE:** For steps 2, 3, 4 and 9 see “Notice” on page 3B4-1.

1. Adjust the lower bearing preload. Refer to “Steering Column Lower Bearing Adjustment” in this section.
2. Lower end of the steering column through the toe panel opening.
   - Guide the steering shaft into the universal yoke, lining up the marks made at removal.
   - Upper universal pinch bolt. The pinch bolt must pass through the shaft undercut.

**Tighten**
- Pinch bolt to “Specifications” at the end of this section.
- Align the seal (279) and cover (278) with the floor and dash panel assembly.
- Align the column support bracket protrusion with the index slot in the steering column.
3. Clamp (281), bolt (280) and nut (282). Position the clamp as shown in figure 48.

**Tighten**
- Nut to 15 N·m (11 ft. lbs.).
4. Clamp (276) and bolt (275).

5. Seal (279), cover (278) and screws (277) to the dash panel assembly.
6. Outer brace (283), bolt and nut to the column support bracket (P200 + 300 (42) models).

**Tighten**
- Bolt to 25 N·m (18 ft. lbs.).
7. Transmission control linkage to the shift tube levers (Column Shift Models).
8. Turn signal wiring harness.
   - On a standard column with automatic transmission connect the conductor tube at the instrument panel.
9. Steering wheel. Refer to “Steering Wheel Replacement.”
10. Battery ground cable.

**Install or Connect (Figures 49 and 50)**

**Figure 51—Shift Tube Adjustment—3 Speed Manual Transmission**
1. Loosen the adjusting ring bolts (306).
2. Loosen the clamp bolt (317).
3. Rotate the adjusting ring to give a 0.13 mm (0.005 inch) end play between the adjusting ring and first and reverse lever (figure 51).

**Tighten**
- Adjusting ring bolt (306) to 8 N·m (70 in. lbs.).
- Clamp bolt (317) to 14 N·m (10 ft. lbs.).

**AUTOMATIC TRANSMISSION**
1. Place the shift tube lever in “Neutral” or “Drive.”
2. Loosen the adjusting ring bolt (306).
3. Rotate the shift tube adjusting ring to obtain a 8.4 to 9.1 mm (0.33 to 0.36 inch) clearance between the shift tube lever and adjusting ring (figure 52).

**Tighten**
- Adjusting ring bolt to 8 N·m (70 in. lbs.).
**STANDARD STEERING COLUMN UNIT REPAIR**

**P(42) MODELS**

### Remove or Disconnect
- Steering column assembly. Refer to "Standard Steering Column Replacement" (P42 Model) in this section.

### Disassemble (Figure 49)
- Slide the steering shaft assembly from the lower end of the steering column.
1. Lower bearing bolt (317), washer (318), nut (319), clamp (316) and spring (315).
2. Back-up lamp switch.
3. Pivot pin (297) and shift lever (299).
5. Control lever screw (291) and lever (292).
6. Column wiring harness cover.
7. Turn signal switch screws (287).
8. Housing (293). Rotate the housing counterclockwise.
   - The housing and switch cannot be completely removed from the column until the shift lever housing is removed.
9. Washer assembly (294, 295) and shift lever housing (296) (or extension housing) from the column.
   - Separate the turn signal switch, switch control support assembly, turn signal housing and shift lever housing (or housing extension) assemblies.
10. Upper bearing (289). Press the bearing out of the switch contact support (290).
11. Bushing (302) and seat (303).
12. Bolts (306), washers (307, 308) and adjusting ring clamp (310).
13. Adjusting ring and bearing (314) assembly.
   - Press the bearing out of the adjusting ring.
14. First-reverse shift lever and spacer (3-Speed Column).
   - Place the column upright on the floor, supporting it with two pieces of wood. Place a block of wood on the upper end of the shift tube. Press down on the shift lever with foot while tapping on the wood block to withdraw the tube from the column jacket.

**NOTICE:** In some tolerance stack-up cases it may be necessary to use a press. Be careful not to damage the tube or jacket.

16. Seal (320) and cover (321).
17. Cover (279), seal (278) and clamp from steering column jacket (305).

### Assemble (Figure 49)
- Apply a thin coat of lithium grease to all friction surfaces.
1. Clamp, seal (278) and cover (279) over the end of the jacket (305).
- Apply lithium grease to all bearing surfaces on the shift tube.
2. Seal (320) onto the shift tube and place the shift tube in the jacket.
- Temporarily install the spacer, first-reverse shift lever and lower adjusting ring. Place a block of wood on top of the adjusting ring and tap until the shift tube bottoms. Remove the adjusting ring, shift lever and spacer (3-Speed Columns).
- Align the three holes in the selector plate with the three holes in the jacket. Position the clamping ring and install the three screws. The shift tube spring retainer must bottom against the jacket stops (Automatic Columns).
- Lubricate and install the spacer and first-reverse shift lever. The tang of the lever is toward the top of the column (3-Speed Column).
3. Bearing in the adjusting ring (314).
4. Adjusting ring and bearing (314) assembly, clamp (310), washers (308, 307) and bolts (306).
5. Seat (303) and bushing (302) to the upper end of the housing.
- Thread the turn signal switch wiring harness through the switch and lever (or extension) housing.
- Lubricate the inner diameter of the shift housing.
6. Shift lever (or extension) housing onto the upper end of the column.
8. Upper bearing into the switch contact support.
9. Turn signal switch housing (293), contact support, bearing, switch and switch screws. Tighten screws to 2.8 N·m (25 in. lbs.).
10. Wiring harness cover and back-up lamp switch.
11. Control lever (292) and the gear shift lever (299).

### Adjust
- Shift tube. Refer to "Shift Tube Adjustment" in this section.
12. Spring (315), clamp (316), bolt (317), washer (318) and nut (319). Tighten the bolt finger tight.
- Slide the steering shaft assembly up through the column assembly.

### Install or Connect
- Steering column assembly. Refer to "Standard Steering Column Replacement" in this section.
INTERMEDIATE SHAFT UNIT REPAIR P(42) MODELS

Figure 53—Intermediate Shaft—P(42) Model

Remove or Disconnect

- Intermediate shaft. Refer to "Intermediate Shaft Replacement" in this section.

Disassemble (Figure 54)

- If the upper and lower half of the intermediate shaft is to be replaced, proceed as follows:
- Place the intermediate shaft (320) on a bench and straighten the tangs on the dust cap (329). Separate the upper and lower portions of the shaft assembly.
1. Dust cap (329) and dust seal (328).
- If the trunnion assemblies are to be replaced, proceed as follows:
2. Bearing cups (325).
   - Support the yoke on a bench vise and drive out one bearing cup by tapping on the opposite bearing cup. Use a soft drift and hammer.
   - Support the other side of the yoke and drive out the remaining bearing cups, as described in the previous step.
3. Trunnion (326) from the yokes (324, 327).
4. Trunnion (326) from the yokes, (331, 330).

Assemble (Figure 53)

- If the yoke trunnions were removed, assemble as follows:
  1. Trunnion (326) into the yokes (331, 330).
  2. Trunnion (326) into the yokes (327, 321).
  3. Bearing cups (325) into the yokes.
- Reassemble the intermediate shaft assembly as follows:
  4. Dust cap (329) and dust seal (328) over the shaft of the lower yoke (330) assembly.
- Align the arrow on the lower yoke assembly shaft with the arrow on the upper yoke assembly tube and push the two assemblies together.
- Push the dust seal (328) and dust cap (329) into position on the lower end of the upper yoke assembly and bend the tangs of the dust cap down against the yoke tube.

Install or Connect

- Intermediate shaft. Refer to "Intermediate Shaft Replacement" in this section.

SECTION 3C
FRONT SUSPENSION

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology "NOTICE: Refer to 'Notice' on page 3C-1 of this section."

NOTICE: All front suspension fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of these parts.

GENERAL DESCRIPTION

An independent suspension is standard on the R-G-P model vehicles. This suspension features unequal length control arms (the lower control arm is the load carrying member), coil springs and shock absorbers to reduce vibration and shock load, plus a stabilizer bar to control sway or roll. Air cylinders inside coil springs are available to minimize "crash through" on large road bumps. A special heavy duty front suspension is available on P model vehicles. This suspension (RPO FS3), centered around a solid I-beam axle, includes leaf springs, shock absorbers, and a stabilizer bar.

The V model (four wheel drive) suspension includes leaf springs, shock absorbers, and a stabilizer bar.

SHOCK ABSORBER BENCH TEST

SPIRAL GROOVE SHOCK ABSORBERS
1. Purge the air from the pressure chamber.
   - Extend the shock vertically—top end up.
   - Turn the shock over and collapse it vertically—top end down.
   - Repeat the above step five times.
2. Place the shock absorber in a vise with the jaws clamped onto the shock’s bottom mount.
   - Shock absorber should be positioned vertically in the vise—top end up.
   - Do not clamp the vise jaws on the shock’s reservoir tube.
3. Pump the shock absorber at various rates of speed and observe the rebound force.
   - Rebound force is normally stronger than the compression force (approximately two to one).
   - Rebound force should be smooth and constant for each stroke rate.
4. Compare with a good shock absorber.
5. If one of the following are observed, replace the shock absorber.
   - A skip or lag at reversal near mid-stroke.
   - A seize (except at the extreme ends of travel).
   - A noise (grunt or squeal) after completing one full stroke in both directions.
   - A clicking noise at fast reversal.

NON-SPIRAL GROOVE SHOCK ABSORBERS
- Purging air from non-spiral groove shock absorbers is not necessary. The shock absorbers have a gas filled cell in their reservoirs (as opposed to the air filled cell in the spiral groove shock absorber reservoirs).
1. Place the shock absorber in a vise with the jaws clamped on the shock absorber’s top mount.
   - Shock absorber should be held vertically in the vise with its bottom end up.
   - Do not clamp the vise jaws on the shock’s reservoir tube.
2. Pump the shock absorber at various rates of speed and observe the rebound force.
   - Rebound force is normally stronger than the compression force (approximately two to one).
   - Rebound force should be smooth and constant for each stroke rate.
3. Compare with a good shock absorber.
4. If one of the following are observed, replace the shock absorber.
   - A skip or lag at reversal near mid-stroke.
   - A seize (except at the extreme ends of travel).
   - A noise (grunt or squeal) after completing one full stroke in both directions.
   - A clicking noise at fast reversal.

DIAGNOSIS OF WHEEL BEARINGS

When diagnosing bearing condition, keep in mind the general condition of all parts during disassembly and inspection. Use Figures 1, 2, 3 and 4 to classify the failure, and follow the recommended repair procedures.
ABRASIVE ROLLER WEAR
Pattern on races and rollers caused by fine abrasives.
Clean all parts and housings, check seals and bearings and replace if leaking, rough or noisy.

ABRASIVE STEP WEAR
Pattern on roller ends caused by fine abrasives.
Clean all parts and housings, check seals and bearings and replace if leaking, rough or noisy.

GALLING
Metal smears on roller ends due to overheat, lubricant failure or overload.
Replace bearing, check seals and check for proper lubrication.

ETCHING
Bearing surfaces appear gray or grayish black in color with related etching away of material usually at roller spacing.
Replace bearings, check seals and check for proper lubrication.

Figure 1—Diagnosis of Front Wheel Bearings
CAGE WEAR
Wear around outside diameter of cage and roller pockets caused by abrasive material and inefficient lubrication.
Clean related parts and housings.
Check seals and replace bearings.

INDENTATIONS
Surface depressions on race and rollers caused by hard particles of foreign material.
Clean all parts and housings. Check seals and replace bearings if rough or noisy.

BENT CAGE
Cage damaged due to improper handling or tool usage.
Replace bearing.

Figure 2—Diagnosis of Front Wheel Bearings
FRETTAGE
Corrosion set up by small relative movement of parts with no lubrication. Replace bearing. Clean related parts. Check seals and check for proper lubrication.

SMEARS
Smearing of metal due to slippage. Slippage can be caused by poor fits, lubrication, overheating, overloads or handling damage. Replace bearings, clean related parts and check for proper fit and lubrication.

STAIN DISCOLORATION
Discoloration can range from light brown to black caused by incorrect lubricant or moisture. Re-use bearings if stains can be removed by light polishing or if no evidence of overheating is observed. Check seals and related parts for damage.

HEAT DISCOLORATION
Heat discoloration can range from faint yellow to dark blue resulting from overload or incorrect lubricant. Excessive heat can cause softening of races or rollers. To check for loss of temper on races or rollers a simple file test may be made. A file drawn over a tempered part will grab and cut metal, whereas, a file drawn over a hard part will glide readily with no metal cutting. Replace bearings if over heating damage is indicated. Check seals and other parts.

Figure 3—Diagnosis of Front Wheel Bearings
MISALIGNMENT
Outer race misalignment due to foreign object.
Clean related parts and replace bearing. Make sure races are properly seated.

CRACKED INNER RACE
Race cracked due to improper fit, cocking, or poor bearing seats.
Replace bearing and correct bearing seats.

FATIGUE SPALLING
Flaking of surface metal resulting from fatigue.
Replace bearing, clean all related parts.

BRINELLING
Surface indentations in raceway caused by rollers either under impact loading or vibration while the bearing is not rotating.
Replace bearing if rough or noisy.

ON-VEHICLE SERVICE:
INDEPENDENT FRONT SUSPENSION

SHOCK ABSORBER

Remove or Disconnect (Figures 5, 6, 7, 8, and 9)

- Raise the vehicle on a hoist.
- 1. Shock absorber (20) from the lower control arm.
   - Nuts (23), washers (22) and bolts (21) (Figure 9).
- 2. Shock absorber (20) from the frame.
   - Nuts (16), washers (17), and bolts (21) (Figure 9).

Inspect

- Shock absorbers for damage and leaking.
- Test the shock absorbers. Refer to "Shock Absorber Bench Test" in this section.

Install or Connect (Figures 5 through 9)

NOTICE: Refer to "Notice" on page 3C–1 of this section.

1. Shock absorber (20) onto the vehicle.
   - Bolts (21), washers (17, 22), and nuts (16, 23) (figure 9).

Tighten

- R models.
  - Nut (16) to 190 N·m (140 ft. lbs.).
  - Bolt (21) to 80 N·m (59 ft. lbs.).
- G models.
  - Bolts (21) to 103 N·m (80 ft. lbs.).
- P models.
  - Nut (16) to 190 N·m (140 ft. lbs.).
  - Nut (23) to 80 N·m (59 ft. lbs.).
2. Lower the vehicle.

STABILIZER BAR

Remove or Disconnect (Figures 5 through 8 and 10)

- Raise the vehicle and support with suitable safety stands. Remove the wheel and tire assembly.
- 1. Stabilizer bar (59) from the frame.
   - Bolts (54), nuts (58), washers (55, 57) and clamps (52).
- 2. Stabilizer bar (59) from the lower control arm (36).
   - Bolts (43), nuts (38), washers (39, 41) and clamps (42).
   - Stabilizer bar (59) drops down—remove the bushings (40, 53).

Inspect

- Rubber bushings (40, 53) for excessive wear, aging, or other damage. Replace as necessary.

Install or Connect (Figures 5 through 10)

1. Bushings (40, 53) to the stabilizer bar (59).
   - Slit on the insulator faces forward.
   - Use rubber lubricant to ease the installation.

NOTICE: Refer to "Notice" on page 3C–1 of this section.

2. Stabilizer bar (59) to the vehicle.
   - Position the stabilizer bar and attach the clamps (52), bolts (54), washers (55, 57) and nuts (58).
   - Clamps (42), bolts (43), washers (39, 41) and nuts (38).

Tighten

- R and P models.
  - Nuts (38, 58) to 33 N·m (24 ft. lbs.).
- G models.
  - Nut (38) to 29 N·m (21 ft. lbs.).

WHEEL HUB/ROTOR ASSEMBLY

Remove or Disconnect (Figures 5 through 8, and 11)

- Raise the vehicle and support it with suitable safety stands. Remove the wheel and tire assembly.
1. Caliper. Refer to BRAKES (SEC. 5).

NOTICE: Support the caliper with a piece of wire to prevent damage to the brake line.
2. Wheel Hub/Rotor (81)
   - Dust cap (79).
   - Cotter pin (80), nut (78), and washer (77).
   - Pull the hub/rotor free, making sure the outer wheel bearing (76) comes free of the hub/rotor.
   - Do not damage the steering knuckle (70) spindle threads.
3. Inner wheel bearing (73).
   - Pry out the seal (72).
4. Races (75, 82).
   - Drive out each race using a brass drift inserted behind the race in notches in the hub.

Clean
1. Grease from the hub/rotor (81) and steering knuckle spindle.
   - Remove grease from inside the hub.
2. Grease from the wheel bearings (73, 76) and races (72, 75).
   - Use clean solvent and a small brush (no loose bristles).
   - Do not spin the wheel bearings with compressed air to dry them—the wheel bearings may be damaged.

Inspect
1. Wheel bearings (73, 76) and their races (72, 75) for damage or wear.
   - Refer to “Diagnosis of Wheel Bearings,” in this section.
   - If either a bearing or its race is damaged or worn, replace both.
2. Hub/rotor for damage.
   - Out-of-round or scored conditions.
   - Pitting or cracks.

Install or Connect (Figures 5 through 8, 11 and 12)

Tools Required:
- J-8092 Driver Handle
- J-8457 Wheel Bearing Race Installer
- J-8849 Wheel Bearing Race Installer
- J-9746-02 Hub/Rotor Support

NOTICE: Start the races squarely inside the hub/rotor to avoid distortion and possible cracking.
1. Races (72, 75) into the hub/rotor (81).
   - Place the hub/rotor on J-9746-02 and rest this assembly on press bars.
   - Use J-8457 to drive the outer bearing outer race (75) into position (figure 12).
   - Turn over the hub/rotor, remove J-9746-02, and drive in the inner bearing outer race (82) with J-8449.

Important
- Use an approved high-temperature front wheel bearing grease to lubricate the bearings. Refer to MAINTENANCE AND LUBRICATION (SEC. 9B).
- Do not mix different greases as mixing may change the grease’s properties resulting in poor performance.
2. Apply a thin film of grease to the steering knuckle spindle at the outer wheel bearing seat and at the inner wheel bearing seat, shoulder, and seal seat.
3. Put a small quantity of grease inboard of each wheel bearing dust cap (79).

NOTICE: Failure to completely pack the wheel bearing (cones, rollers, and cage) with grease will result in premature wheel bearing damage and/or wear.
4. Fill each wheel bearing (cone and roller assembly) full of grease.
   - Use a cone-type grease machine that forces grease into the bearing.
   - If a cone-type grease machine is not available, pack the wheel bearing by hand.
   - When packing the wheel bearing by hand, work the grease into the bearings between the rollers, cones, and the cage.
5. Inner wheel bearing (73) into the hub/rotor (81).
   - Put an additional quantity of grease inboard of this bearing.
6. New seal (72).
   - Use a flat plate or block to install the seal to insure it is flush with the hub/rotor flange.
   - Lubricate the seal lip with a thin layer of grease.
   - Do not damage the steering knuckle spindle threads.
8. Outer wheel bearing (76).
   - Slide it over the spindle until the wheel bearing (76) fully seats against the hub/rotor outer race (75).

NOTICE: Refer to “Notice” on page 3C – 1 of this section.
9. Washer (77), nut (78), and cotter pin (80).
   - Do not place the cotter pin through the hole in the spindle until the wheel bearings are adjusted.

Tighten
- Nut (78) to 16 N m (12 ft. lbs.) while turning the hub/rotor assembly in either direction.
10. Put an additional quantity of grease outboard of the wheel bearing (76).
11. Adjust the wheel bearings.
   - Refer to “Wheel Bearing Adjustment,” in this section.
12. Dust cap (79) on the hub/rotor (81).
13. Caliper. Refer to BRAKES (SEC. 5).
14. Tire and wheel assembly and lower the vehicle.

**WHEEL BEARING ADJUSTMENT**

*Important*
- The proper functioning of the front suspension cannot be maintained unless the front wheel bearings are correctly adjusted. The bearings must be a slip fit on the spindle and the inside diameter of the wheel bearing must be lubricated to ensure the bearings will creep. The spindle nut (78) must have a free-running fit on the spindle threads.

**NOTICE:** Never preload the front wheel bearings. Damage can result by the steady thrust on the roller ends which comes from preloading.
**Adjust**
- Raise the vehicle and support it with suitable safety stands under the lower control arms.

1. Remove the dust cap (79) from the hub/rotor (81).
2. Remove the cotter pin (80).

**Tighten**
- Nut (78) to 16 N-m (12 ft. lbs.) while rotating the wheel and tire assembly (this will seat the bearings).

3. Back off the nut (78) to the "just loose" position.
4. Hand tighten the nut (78).
5. Back off the nut (78) until the hole in the spindle lines up with a slot on the nut.
   - Do not back off more than \( \frac{1}{2} \) of a flat.
6. New cotter pin (80).
   - Make sure the bent ends do not interfere with the dust cap (79).

**Measure**
- Endplay in the hub/rotor assembly (81).
  - It should measure between 0.03 mm (0.0012 inches) and 0.13 mm (0.005 inches) when properly adjusted.

7. Install the dust cap (79) on the hub/rotor (81).
8. Install the wheel and tire assembly if removed and lower the vehicle.
FRONT SUSPENSION 3C-15

A. Press Bars
B-07729

Figure 13—Removing the Hub Bolts

WHEEL HUB BOLT

Remove or Disconnect (Figures 5 through 8, and 13)

Tools Required:
- J-9746-02 Hub/Rotor Support

1. Hub/rotor from the vehicle.
   - Refer to “Wheel Hub, Bearing and Race” in this section.
   
   NOTICE: Place J-9746-02 between the press bars and the hub/rotor to protect the rotor surfaces.

2. Wheel hub bolts (74) with a press.
   - Support the hub/rotor (81) using J-9746-02 and press bars (Figure 13).
   - Do not damage the wheel mounting surface on the hub/rotor flange.

Install or Connect (Figures 5 through 8, and 14)

NOTICE: Refer to the “Notice” on page 3C-1 of this section.

1. Wheel hub bolts (74) into the hub/rotor (81).
   - Place four washers onto the bolt, then fasten a nut onto the bolt until the nut bottoms on the washers (Figure 14).
   - Tighten the nut until the bolt fully seats into the hub/rotor (81).

STEERING KNUCKLE

Remove or Disconnect (Figures 5 through 8, 15 and 16)

Tools Required:
- J-23742 Ball Joint Separator

Important
- It is recommended that the vehicle be raised and

Figure 15—Disconnecting the Upper Ball Joint
3C-16 FRONT SUSPENSION

Figure 16—Disconnecting the Lower Ball Joint

supported as on a twin-post hoist so that the front coil spring remains compressed, yet the wheel and steering knuckle assembly remain accessible. If a frame hoist is used, support the lower control arm with an adjustable jackstand to safely retain the spring in its curb height position.

1. Wheel and tire assembly.
2. Caliper.
   • Refer to BRAKES (SEC. 5).
3. Hub/Rotor (81).
   • Refer to "Wheel Hub, Bearing and Race," in this section.
4. Splash shield (71).
   • Bolts (83) and washers (84).
   • Gaskets (85).
5. Steering knuckle from the tie rod end.
   • Refer to STEERING LINKAGE (SEC. 3B1).
6. Steering knuckle (70) from the upper ball joint (13).
   • Position a floor jack under the lower control arm (36) near the spring seat.
   • Raise the jack until it just supports the lower control arm.
   • Use J-23742 to break the upper ball joint free of the steering knuckle (figure 15).
   • Raise the upper control arm (28) to disengage the upper ball joint from the steering knuckle.

Important
• Floor jack must remain under the lower control arm spring seat during removal and installation to retain the spring and the lower control arm in position.

7. Steering knuckle (70) from the lower ball joint (37).
   • Use J-23742 to break the lower ball joint free from the steering knuckle (figure 16).
   • Lift the steering knuckle off the lower ball joint.

Inspect
1. Tapered holes in the steering knuckle that attach to the ball joints and the tie rod end.
   • Remove any dirt.
   • If any tapered hole is out of round, deformed, or damaged in any way, replace the steering knuckle (70).
2. Spindle for wear or damage.
   • The steering knuckle (70) must be replaced if the spindle is damaged or worn.

NOTICE: For steps 3 and 8, refer to the "Notice" on page 3C-1 of this section.

Install or Connect (Figures 5 through 8)
1. Steering knuckle (70) to the lower ball joint (37).
   • Press the steering knuckle onto the lower ball joint (37) until it is fully seated.
2. Steering knuckle (70) to the upper ball joint (13).
   • Lower the upper control arm (28) to seat the upper ball joint (13) into the steering knuckle.
3. Nuts (14, 35).

Tighten
• R10/1500, G10/1500 and G20/2500 models.
   — Nut (14) to 68 N-m (50 ft. lbs.).
   — Nut (35) to 122 N-m (90 ft. lbs.).
• All other models.
   — Nuts (14, 35) to 122 N-m (90 ft. lbs.).
   • Tighten the nuts (14, 35), if needed.

Important
• R10/1500, G10/1500 and G20/2500 models.
   — Nut (14), maximum torque to align the cotter pin is 122 N-m (90 ft. lbs.).
   — Nut (35), maximum torque to align the cotter pin is 175 N-m (130 ft. lbs.).
• All other models.
   — Nuts (14, 35), maximum torque to align the cotter pin is 175 N-m (130 ft. lbs.).
5. Remove the floor jack.
7. Tie rod end to the steering knuckle (70).
   • Refer to STEERING LINKAGE (SEC. 3B1).
8. Splash shield (71).
   • Washers (84) and bolts (83) in position.

Tighten
• Bolts (83) to 135 N-m (120 in. lbs.).
   • Refer to "Wheel Hub, Bearing and Race" in this section.
5. Caliper.
   • Refer to BRAKES (SEC. 5).
6. Adjust the wheel bearings.
   • Refer to "Wheel Bearing Adjustment" in this section.
7. Check the front alignment and reset as required.
   • Refer to FRONT END ALIGNMENT (SEC. 3A).
8. Wheel and tire assembly, and lower the vehicle to the ground.

## COIL SPRING

### Remove or Disconnect (Figures 5 through 8, and 17)

Tools Required:
- J-23028-02 Spring Remover

1. Raise the vehicle and support it with suitable safety stands, allowing the control arms to hang free. Remove the wheel and tire assembly.
2. Shock absorber (20) at the lower end and move it aside.
3. Stabilizer bar (59) from the lower control arm (36).
   - Nuts (38), bolts (43), washers (41) and clamp (42).

**CAUTION:** Failure to secure J-23028 to a suitable floor jack could result in personal injury.

4. J-23028-02 to a suitable jack.
5. Place J-23028-02 under the lower control arm shaft (50) as shown in figure 17.

### Install or Connect (Figures 5 through 8 and 17)

Tools Required:
- J-23028-02 Spring Remover

1. Coil spring (32) into position on the lower control arm (36).

**Important**
- Install a chain around the coil spring and through the lower control arm as a safety precaution.

2. Slowly lift the lower control arm into position.
   - Line up the front indexing hole in the shaft (50) with the crossmember attaching studs.
   - Do not damage the lower ball joint (37).
   - Use J-23028-02 bolted on a floor jack.
3. U-bolts (44), washers (48), and nuts (49).

**Tighten**
- G10/1500–20/2500 models to 88 N·m (65 ft. lbs.).
- All other models to 115 N·m (85 ft. lbs.).
4. Lower the floor jack, and remove J-23028-02.
5. Stabilizer bar (59) to the lower control arm (36).
   - Clamp (42), washers (41), bolts (43) and nuts (38).

**Tighten**
- Nuts (38) to 33 N·m (24 ft. lbs.).
6. Shock absorber (20) to the lower control arm (36).
   - Washer (22), bolt (21), and nut (23).

**Tighten**
- R models.
  - Bolt (21) to 80 N·m (59 ft. lbs.).
- G models.
  - Bolt (21) to 103 N·m (80 ft. lbs.).
- P models.
  - Nut (23) to 80 N·m (59 ft. lbs.).
7. Check the front end alignment.
   - Refer to FRONT END ALIGNMENT (SEC. 3A).
8. Wheel and tire and lower the vehicle.

## LOWER BALL JOINT

### Inspect (Figures 5 through 8, and 18)

1. Raise the vehicle and remove the wheel and tire assembly. Support the weight of the control arms at the wheel hub and drum.
2. Measure the distance between the tip of the ball joint stud and the tip of the grease fitting below the ball joint (figure 18).
3. Move the support to underneath the control arm allowing the wheel hub and drum to hang free.
4. Measure the distance as in Step 2.
3C-18 FRONT SUSPENSION

Figure 18—Inspecting the Lower Ball Joint

- If the difference in measurements exceeds 2.38 mm (3/32 inches), for all models, the ball joint is worn and must be replaced.

5. If the ball joint seals are cracked, cut, or torn, replace them.

Remove or Disconnect (Figures 5 through 8, and 19)

Tools Required:
- J-23742 Ball Joint Separator
- J-9519-7 Ball Joint Remover
- J-9519-28 Ball Joint Remover
- J-21474-30 Ball Joint Fixture

- Raise the vehicle on a hoist. If a frame hoist is used it will be necessary to support the lower control arm with a floor stand. Remove the tire and wheel assembly.

1. Cotter pin (34), nut (35), and lube fitting (12).
   - Loosen (two turns) but do not remove the nut (35).

2. Loosen the ball joint in the steering knuckle (31).

Figure 19—Removing the Lower Ball Joint

- Use J-23742 between the ball joint studs (figure 16).
- It may be necessary to remove the caliper and wire it to the frame to gain clearance for J-23742. Refer to BRAKES (SEC. 5).
- Extend J-23742 until the lower ball joint (37) breaks free from the steering knuckle (31).
- Remove the nut (35) and J-23742.

3. Hub/rotor (70) and the knuckle assembly off the lower ball joint (37).

4. Ball joint (37) from the lower control arm (36).
   - Install J-21474-13, J-9519-22, J-9519-16, and J-9519-10 (figure 19).
   - Turn the hex head screw until the ball joint is free of the lower control arm.
   - Remove the tools and the ball joint (37).

Install or Connect (Figures 5 through 8, and 20)

Tools Required:
- J-9519-16 Ball Joint Installer
- J-9519-30 Ball Joint Fixture

1. Ball joint (37) into the lower control arm (36).
   - Start the ball joint into the control arm and install J-9519-16 and J-9519-30 (figure 20).
   - Position the bleed vent in the rubber boot facing inward.
   - Turn the hex head screw until the ball joint is seated in the lower control arm.

2. Ball joint into the steering knuckle (31).
• Mate the steering knuckle (31) to the lower ball joint (37).

3. Caliper if it was removed.
   • Refer to BRAKES (SEC. 5).

NOTICE: Refer to "Notice" on page 3C-1 of this section.

   🔧 Tighten
   • Nut (35) to 122 N·m (90 ft. lbs.).

5. Cotter pin (34).
   • Tighten the nut (35) if needed.
   🔧 Important
   • Maximum torque to align the cotter pin is 175 N·m (130 ft. lbs.).

5. Fitting (12).
   • Lubricate the ball joint (37) with recommended lubricant.

6. Tire and wheel assembly and lower the vehicle to the floor.

UPPER BALL JOINT

Inspect
• The upper ball joint (13) is spring loaded in its socket. Replace the ball joint if there is any lateral shake or if it can be twisted in its socket with the fingers.
• The ball joint seals for cuts or tears. Replace the ball joint if any are found.

Remove or Disconnect (Figures 5 through 8, and 15)

Tools Required:
   J-23742 Ball Joint Separator
• Raise the vehicle on a hoist. If a frame hoist is used, support the lower control arm with a floor jack.
1. Cotter pin (15) from the upper ball joint (13).
   • Loosen the nut (14) two turns, but do not remove the nut.

2. Caliper.
   • Refer to BRAKES (SEC. 5).

3. Upper ball joint (13) from the steering knuckle (31).
   • Use J-23742 to separate the upper ball joint from the steering knuckle (figure 15).
   • Nut (14), and lift the upper control arm (28) free of the ball joint.

4. Ball joint (13) from the upper control arm (28).
   • Drill 6.35 mm (¼ inch) deep holes in the rivet heads using a 3.175 mm (⅛ inch) diameter drill bit.
   • Drill off the rivet heads using a 12.7 mm (½ inch) diameter drill bit.
   • Punch out the rivets and remove the upper ball joint from the upper control arm.

NOTICE: For steps 1 and 2 refer to the "Notice" on page 3C-1 of this section.

Install or Connect (Figures 5 through 8, and 21)

1. Upper ball joint (13) into the upper control arm (28).
   • Position into the upper control arm and install four attaching bolts and nuts (A) (figure 21).
   🔧 Tighten
   • Nuts (A) to 25 N·m (18 ft. lbs.).

2. Upper ball joint to the steering knuckle (31).
   • The upper ball joint must be fully seated into the steering knuckle.
   • Nut (14).
   🔧 Tighten
   • R10/1500, G10/1500 and G20/2500 models.
     — Nut (14) to 68 N·m (50 ft. lbs.).
   • All other models.
     — Nut (14) to 122 N·m (90 ft. lbs.).

3. Cotter pin (15).
   • Tighten the nut (14) if needed.
   🔧 Important
   • R10/1500, G10/1500 and G20/2500 models.
     — Maximum torque to align the cotter pin is 122 N·m (90 ft. lbs.).
   • All other models.
     — Maximum torque to align the cotter pin is 175 N·m (130 ft. lbs.).

4. Upper ball joint grease fitting (12).

5. Grease the upper ball joint (13).
   • Use a recommended lubricant.

Figure 22—Removing the Lower Control Arm Bushings (R10/1500, G10/1500 and G20/2500 Models)

6. Caliper.
   • Refer to BRAKES (SEC. 5).
7. Tire and wheel assembly.
8. Check the front end alignment.
   • Refer to FRONT END ALIGNMENT (SEC. 3A).

LOWER CONTROL ARM PIVOT SHAFT AND BUSHINGS

R10/1500 SERIES MODELS

Remove or Disconnect (Figures 5, 8, 17 and 22)

Tools Required:
J-23028-02 Coil Spring Remover
J-22717 Lower Control Arm Bushing Stake Remover
J-24435-2 Lower Control Arm Bushing Spacer
J-24435-3 Lower Control Arm Bushing Remover
J-24435-6 Lower Control Arm Bushing Spacer
J-24435-7 Lower Control Arm Bushing Fixture

If just the bushings (46) or the pivot shaft (50) need replacement, the lower control arm (36) does not have to be removed from the vehicle.
• Raise the vehicle on a hoist and support the frame so the lower control arms hang free.

CAUTION: Failure to install J-23028-02 to a suitable floor jack could result in personal injury.

1. J-23028-02 to a suitable floor jack and raise it into position [under the lower control arm (26)] inboard of the spring and into the depression of the lower control arm.

Important
• Install a chain over the upper control arm (28) inboard of the stabilizer bar (59) and outboard of the shock absorber (20).
2. Shock absorber (20) from the lower control arm (28).

Figure 23—Installing the Lower Control Arm Bushings (R10/1500, G10/1500 and G20/2500 Models)

NUT (23), WASHER (22), AND BOLT (21).
3. Stabilizer bar (59) from the lower control arm (28).
   • Nuts (38), washers (39, 41), clamp (42), and bolts (43).
4. Pivot shaft end nuts (24).
   • Loosen only, do not remove.
5. Lower control arm from the frame.
   • Nuts (49), washers (48), and U-bolts (44).
   • SLOWLY lower the floor jack until all compression is released from the spring (32).
6. Stakes on the front bushing.
   • Use J-22717 or an equivalent tool.
7. Bushings (46) and the pivot shaft (50) from the lower control arm (36).
   • Use J-24435-2, J-24435-3, J-24435-6, and J-24435-7 (figure 23).
   • Tighten the bolt on J-24435-7 to install the bushing.
   • Install one bushing, then insert the pivot shaft and install the remaining bushing.
   • Make sure J-24435-6 is in position to prevent collapsing the control arm.

NOTICE: For steps 3, 4, 5 and 6, refer to the ‘Notice’ on page 3C-1 of this section.

Install or Connect (Figure 5, 8 and 23)

Tools Required:
J-23028-02 Coil Spring Compressor
J-24435-4 Lower Control Arm Bushing Installer
J-24435-6 Lower Control Arm Bushing Spacer
J-24435-7 Lower Control Arm Bushing Fixture

1. Bushings (46) and the pivot shaft (50).
   • Use J-24435-4, J-24435-6, and J-24435-7 (figure 23).
   • Tighten the bolt on J-24435-7 to install the bushings.
   • Install one bushing, then insert the pivot shaft and install the remaining bushing.
   • Make sure J-24435-6 is in position to prevent collapsing the control arm.
2. Stake the front bushing in at least two places.

**CAUTION:** Failure to secure J-23028-02 to a suitable floor jack could result in personal injury.

3. Lower control arm (36) to the frame.
   - SLOWLY raise the floor jack until the front indexing hole in the pivot shaft (50) lines up with the crossmember attaching studs.
   - Do not damage the ball joint (37).
   - J-23028-02 is bolted to a suitable floor jack.
   - U-bolts (44), washers (48), and nuts (49).

   **Tighten**
   - U-bolt nuts (49) to 115 N·m (85 ft. lbs.).

4. Pivot shaft end nuts (24).

   **Tighten**
   - Nuts (24) to 95 N·m (70 ft. lbs.).

5. Stabilizer bar (59) to the lower control arm (28).
   - Washers (39, 41), clamp (42), bolts (43), and nuts (38).

   **Tighten**
   - Nut (23) to 81 N·m (60 ft. lbs.).

6. Check the front end alignment.

   **NOTICE:** Refer to “Notice” on page 3C-1 of this section.

7. Wheel and tire and lower the vehicle.

G10/1500-20/2500 MODELS  
(EXCEPT 20/2500 MODELS W/6.2L DIESEL)

**Remove or Disconnect (Figures 6, 8, and 22)**

**Tools Required:**
- J-24435-1 Lower Control Arm Bushing Remover
- J-24435-3 Lower Control Arm Bushing Remover
- J-24435-4 Lower Control Arm Bushing Installer
- J-24435-5 Lower Control Arm Bushing Installer
- J-24435-7 Lower Control Arm Bushing Fixture

1. Lower control arm.
   - Refer to “Lower Control Arm,” in this section.

2. Pivot shaft nuts (24) and washers (25).

3. Rear bushing (46).
   - Place the lower control arm in an arbor press.
   - Press the front end of the pivot shaft (50) to remove the rear bushing. Discard the old bushing.
   - The pivot shaft can be removed at this time.

4. Front bushing (46).
   - Stake from the front bushing using J-22717 or an equivalent tool.
   - Tighten J-24435-7 until the bushing comes free. Discard the old bushing (figure 22).

**Install or Connect (Figures 6, 8, 23 and 24)**

**Tools Required:**
- J-24435-4 Lower Control Arm Bushing Installer
- J-24435-6 Lower Control Arm Bushing Spacer
- J-24435-7 Lower Control Arm Bushing Fixture

1. New bushing (46) using J-24435-6, J-24435-4, and J-24435-7 (figure 23).
   - Tighten J-24435-7 until the bushing fully seats.
   - The outer tube hole must be lined up so it faces to the front or forward to the staked bushing.

2. Stake the front bushing in at least two places.

3. Pivot shaft (50) into installed bushing.

4. Remaining bushing (46) into the lower control arm.

**NOTICE:** Refer to “Notice” on page 3C-1 of this section.

5. Pivot shaft washers (25) and nuts (24).

   **Tighten**
   - Nuts (24) to 156 N·m (115 ft. lbs.).

6. Lower control arm (76).
   - Refer to “Lower Control Arm,” in this section.
   - This results with the vehicle being completely assembled and lowered to the ground.

**Remove or Disconnect (Figures 5 through 8, and 25)**

**Tools Required:**
- J-24435-1 Lower Control Arm Bushing Remover
- J-24435-3 Lower Control Arm Bushing Remover
- J-24435-4 Lower Control Arm Bushing Installer

1. Lower control arm (36).
   - Refer to “Lower Control Arm,” in this section.

2. Bushings (46) and the pivot shaft (50) from the lower control arm (36).
   - Use J-24435-1, J-24435-3, and J-24435-7 (figure 25).
   - Tighten the clamp (J-24435-7) to remove the bushing (46).
   - The pivot shaft can be slipped out at this time.
   - Repeat the procedure on the remaining bushing (46) to remove it from the lower control arm (36).

**Install or Connect (Figures 5 through 8, and 26)**

**Tools Required:**
- J-24435-4 Lower Control Arm Bushing Installer
- J-24435-5 Lower Control Arm Bushing Installer
- J-24435-7 Lower Control Arm Bushing Fixture

1. Bushings (46) and the pivot shaft (50) into the lower control arm (36).
   - Use J-24435-1, J-24435-3, and J-24435-7 (figure 25).
   - Tighten the clamp (J-24435-7) to remove the bushing (46).
   - The pivot shaft can be slipped out at this time.
   - Repeat the procedure on the remaining bushing (46) to remove it from the lower control arm (36).

---

**Remove or Disconnect (Figures 5 through 8)**

- Raise the vehicle and support the frame so the control arms hang free. Remove the tire and wheel assembly.

1. Position an adjustable floor jack under the lower control arm (36) inboard of the spring and into the depression in the lower control arm.

**Important**

- Install a chain over the upper control arm (28) inboard of the stabilizer bar (59) and outboard of the shock absorber (20).

2. Shock absorbers (20) from the lower control arm (36).
   - Nut (23), washer (22) and bolt (21).

3. Stabilizer bar (59) from the lower control arm (36).
   - Nuts (38), washers (39, 41), bolts (43) and clamp (42).

4. Lower control arm (36) from the frame crossmember.
   - Nuts (49), washer (48), and U-bolts (44).

---

5. Grease fittings (12).

6. Bushings (46) and bushing seals, and pivot shaft (50).
   - Unscrew the bushings.
   - Slide the pivot shaft out of the lower control arm.
   - Seals are mounted between the bushings and the pivot shaft. Discard the old seals.

**NOTICE:** For steps 1, 3, 4, and 5 refer to the “Notice” on page 3C–1 of this section.

---

**Install or Connect (Figures 5 through 8, and 27)**

1. Pivot shaft (50), seals, and bushings (46), to the lower control arm (36).
   - New seals onto the pivot shaft.

2. Pivot shaft into the lower control arm. Attach the bushings. Center the shaft in the lower control arm (figure 27).

**Tighten**

- Bushings (46) to 379 N·m (280 ft. lbs.).

1. Inspect
   - Pivot shaft (50) for free rotation.
2. Grease fitting (12).
   - Lubricate the bushings with an approved grease.
   - Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).
3. Lower control arm (36) to the frame crossmember.
   - SLOWLY raise the floor jack until the lower control arm (36) is in position.
4. U-bolts (44), washers (48), and nuts (49).

Tools Required:
- J-24435-1 Lower Control Arm Bushing Remover
- J-24435-3 Lower Control Arm Bushing Remover
- J-24435-7 Lower Control Arm Bushing Fixture

1. Upper control arm (28).
   - Refer to “Upper Control Arm,” in this section.
2. Nuts (24), bushings (26) and the pivot shaft (29) from the upper control arm (28).
   - Use J-24435-1, J-24435-3, and J-24435-7 (figure 28).
   - Tighten J-24435-7 to remove the bushing (26).
   - Pivot shaft (29) can be pulled free at this time.
   - Repeat this procedure on the remaining bushing (26). Discard the old bushings.

Install or Connect (Figures 5 through 8, and 29)

Tools Required:
- J-24435-4 Lower Control Arm Bushing Installer
- J-24435-5 Lower Control Arm Bushing Installer
- J-24435-7 Lower Control Arm Bushing Fixture

NOTICE: Refer to the “Notice” on page 3C – 1 of this section.

1. Bushings (26) and the pivot shaft (29) into the upper control arm (28).
   - Use J-24435-4, J-24435-5, and J-24435-7 (figure 29).
   - Tighten the clamp (J-24435-7) to install the bushing (26).
   - Slide the pivot shaft (29) into the upper control arm (28), then install the other bushing (26).
Figure 29—Installing the Upper Control Arm Bushings (R10/1500, G10/1500 and G20/2500 Models)

- Nuts (24) in place.

**Tighten**
- Nuts (24) to 156 N·m (115 ft. lbs.).
- Upper control arm (28) to the crossmember.
- Refer to "Upper Control Arm," in this section.
- Caliper if it was removed.
- Refer to BRAKES (SEC. 5).
- Check the front end alignment.
- Refer to FRONT END ALIGNMENT (SEC. 3A).
- Remove the supports and lower the vehicle to the ground.

R-P20/2500-30/3500, G30/3500 MODELS

**++ Remove or Disconnect (Figures 5 through 8)**
- Raise the vehicle and support the lower control arms with a floor jack positioned under or near the ball joint assembly. Remove the wheel and tire assembly.
- Loosen, but do not remove the pivot shaft to frame nuts (27).
- Shim packs (18).
- Pivot shaft to frame nuts (27), bolts (4), and spacers (19).
- Do not allow the upper control arm (28) to swing too far from the frame crossmember.

**Important**
- Install a chain over the upper control arm (28) inboard of the stabilizer bar (59) and outboard of the shock absorber (20), to retain the upper control arm in a close relationship to the frame crossmember.
- Pivot shaft (29) and bushings (26).
- Grease fitting (12).
- Unscrew the bushings (26).
- Slide the pivot shaft out of the upper control arm. Remove and discard the inner seals (between the bushings and the pivot shaft).

++ Install or Connect (Figures 6 through 8, and 30)
- Pivot shaft (29), seals, and bushings (26) onto the upper control arm (28).
- New inner seals onto the pivot shaft.
- Slide the pivot shaft into position inside the upper control arm. Screw on the new bushings. Do not tighten.

**Important**
- The pivot shaft (29) must be centered in the upper control arm (28) as shown in figure 30.

**Tighten**
- Bushings (26) to 257 N·m (190 ft. lbs.).

**Inspect**
- Pivot shaft for free rotation.
- Grease the bushings (26). Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).

NOTICE: Refer to the “Notice” on page 3C-1 of this section.

- Pivot shaft (29) to the frame.
- Bolts (4), shim packs (18), spacers (19), and nuts (27).
- Shims are positioned into their original positions. Make sure the convex and concave sides of the shims are together.

**Tighten**
- Nuts (27) to 142 N·m (105 ft. lbs.).

- Remove the safety chain and install the wheel and tire assembly.
- Check the front end alignment.
- Refer to FRONT END ALIGNMENT (SEC. 3A).

Lower the vehicle to the ground.

LOWER CONTROL ARM

++ Remove or Disconnect (Figures 5 through 8, and 16)

Tools Required:
- J-23742 Ball Joint Separator

- Raise the vehicle and support it with suitable safety stands. Remove the wheel and tire assembly.
- Caliper.
- Refer to BRAKES (SEC. 5).
- Coil spring (32).
- Refer to "Coil Spring," in this section.
- The lower control arm is separated from the frame.
- Use a jack to support the inboard end of the lower control arm (36).
- Lower control arm (36) from the steering knuckle (31).
- Cotter pin (34), then loosen the nut (35) one turn.
- Install J-23742, with the large cup end over the upper ball joint nut (14). Extend threaded end until the ball joint stud loosens from the steering knuckle. Remove J-23742 and the nut (35).
FRONT SUSPENSION 3C-25

Install or Connect (Figures 5 through 8)

1. Lower control arm (36) to the steering knuckle (31).
   • Position the lower control arm ball joint stud (37) into the steering knuckle (31).
   • Nut (35) onto the stud. Do not tighten.
2. Coil spring (32).
   • Refer to "Coil Spring," in this section.
   • This step results with the lower control arm being attached to the frame.
   NOTICE: Refer to "Notice" on page 3C-1 of this section.
3. Nut (35) and cotter pin (34).
   • Nut (35) to 122 N·m (90 ft. lbs.).
   • Tighten the nut if needed to install the cotter pin.
   Important
   • Maximum torque to align the cotter pin is 175 N·m (130 ft. lbs.).
   • Refer to BRAKES (SEC. 5).
5. Check the front end alignment.
   • Refer to FRONT END ALIGNMENT (SEC. 3A).
6. Tire and wheel assembly and lower the vehicle.

UPPER CONTROL ARM

Remove or Disconnect (Figures 5 through 8, and 15)

Tools Required:
   • J-23742 Ball Joint Separator
   • Raise the vehicle and support it with suitable safety stands. Remove the wheel and tire assembly. Place an adjustable jackstand under the lower control arm for support.
1. Caliper.
   • Refer to BRAKES (SEC. 5).
2. Upper control arm (28) from the steering knuckle (31).
   • Cotter pin (15).
   • Loosen the nut (14). Do not remove it.
   • Install J-23742 with the large cupped end over the lower control arm ball joint stud nut (35). Expand J-23742 until the upper control arm separates.
   • Nut (14) from the upper ball joint stud and raise the upper control arm to clear the steering knuckle.
3. Upper control arm (28) from the frame bracket (9).
   • Nuts (27), spacers (19), shims (18), washers (5) and bolts (6).

Important
   • Tape the shims together in their original positions and tag for proper relocation.

Install or Connect (Figures 5 through 8)

NOTICE: For steps 2 and 3, refer to "Notice" on page 3C-1 of this section.

1. Shims (18) into position on the upper control arm frame bracket (9).
   • Make sure the shims are positioned with concave and convex sides together.
2. Upper control arm (28) to the frame bracket (9).
   • Spacers (19) and nuts (27), washers (5), and bolts (6).

Important
   • A normal shim pack will leave at least two threads of the bolt (6) exposed beyond the nut.
   • If two threads cannot be obtained; check for damaged control arm or related parts. The difference between the front and rear shim packs must not exceed 7.62 mm (0.30 inches). The front shim pack must be at least 6.09 mm (0.24 inches).
   • Always tighten the thinner shim pack's nut (27) first for improved shaft to frame clamping force and torque retention.
3C-26 FRONT SUSPENSION

Tighten

- R10/1500, G10/1500 and G20/2500 models.
  - Nuts (27) to 95 N-m (70 ft. lbs.).
- All other models.
  - Nuts (27) to 142 N-m (105 ft. lbs.).

3. Upper control arm (28) to the steering knuckle (31).

- Insert the upper control arm ball joint stud (13) into the steering knuckle (31).

4. Nut (14) and cotter pin (15).

- Tighten the nut if needed to install the cotter pin.

Tighten

- R10/1500, G10/1500 and G20/2500 models.
  - Nut (14) to 68 N-m (50 ft. lbs.).
- All other models.
  - Nut (14) to 122 N-m (90 ft. lbs.).

Important

- R10/1500, G10/1500 and G20/2500 models.
  - Maximum torque to align the cotter pin is 122 N-m (90 ft. lbs.).
- All other models.
  - Maximum torque to align the cotter pin is 175 N-m (130 ft. lbs.).

5. Caliper.

- Refer to BRAKES (SEC. 5).

6. Check the front end alignment.

- Refer to FRONT END ALIGNMENT (SEC. 3A).

7. Wheel and tire assembly. Lower the vehicle to the ground.

SUSPENSION UNIT

The front suspension and frame crossmember can be removed or installed as a unit if extensive service is required.

Remove or Disconnect (Figure 5 through 8, and 31 through 33)

- Raise the hood and disconnect the battery negative cable.
- Hoist the vehicle and support it with suitable safety stands placed at the frame side rails. Remove the tire and wheel assembly and then lower the hoist.

1. Front brake hose clip from each upper control arm.

2. Brake hoses from the calipers.

- Clean the area adjacent to the brake hose fittings.
- Discard the special washers (2 on each hose) and cover the disconnected ends of each hose with suitable material.
- Refer to BRAKES (SEC. 5).

3. Tie rod ends from the steering knuckle (31).

- Refer to STEERING LINKAGE (SEC. 3B1).

4. Front stabilizer from the lower control arms (36).

- Nuts (38), washers (39, 41), bolts (43), and clamps (42).

5. Shock absorbers (20) from the lower control arms (36).

- Nut (23), washer (22), and bolt (21).

6. Brake line clip bolts from the front suspension crossmember.

- On C series models the clip is located under the right side engine mount support bracket.

NOTICE: Failure to disconnect these clips from the suspension unit will result in severe damage to the brake line when the unit is lowered from the vehicle.

7. Suspension crossmember from the engine mounts.

- Refer to ENGINE (SEC. 6A).

8. Suspension crossmember from the frame rail (figure 31).

9. Raise the hoist to support the suspension crossmember.

10. Support the engine.

- Must be done before the suspension unit is lowered from the vehicle.

11. Suspension unit and crossmember from the vehicle.

- Upper control arm bracket to the frame side rail nuts (10), washer (7), and bolts (6).
- Lower the suspension unit and the crossmember to bring the unit clear of the vehicle.

NOTICE: For steps 3, 7, and 8, refer to the “Notice” on page 3C-1 of this section.

Install or Connect (Figures 5 through 8 and 31 through 33)

1. Position the new suspension unit and crossmember and raise it with the hoist to align the suspension crossmember and frame holes.

2. Suspension crossmember to the frame rail bolts (figure 31).

3. Upper control arm (28) and the frame bracket bolts (6).

- Washers (7) and nuts (10). Do not tighten.

Tighten

- R models.
  - Bolts (6) to 87 N-m (64 ft. lbs.), except R30/3500 with F42.
  - Bolts (6) to 135 N-m (100 ft. lbs.), R30/3500 with F42.
- G models.
  - Bolts (4) to 125 N-m (92 ft. lbs.).
- P models.
  - Bolts (4) to 87 N-m (64 ft. lbs.), except P30/3500 motor home.
  - Bolts (4, 6) to 135 N-m (100 ft. lbs.), P30/3500 motor home.

Important

- The upper control arm to frame bracket bolts must be tightened first.
- The crossmember must be in contact with the frame side rails.

4. Crossmember to frame bolts (1), through the reinforcement (8).

- Washers (2) and nuts (3) as used.

Tighten

- R30/3500 models with F42.
  - Nut (3) to 180 N-m (133 ft. lbs.).
- P30/3500 motor home.
  - Bolt (1) to 290 N-m (214 ft. lbs.).

**ON-VEHICLE SERVICE:**
**I-BEAM (RPO FS3) FRONT SUSPENSION**

**SHOCK ABSORBER**

Remove or Disconnect (Figures 34 through 36)
- Raise the vehicle and support it with suitable safety stands. Remove the wheel and tire assembly.
1. Shock absorber (113) from the leaf spring spacer (158).
  - Nut (109) and washer (111).
2. Shock absorber (113) from the frame.
  - Nut (109) and washer (111).
  - Pull the shock free from the vehicle.

Inspect
- Shock absorbers for damage and leaking.
- Test the shock absorbers. Refer to “Shock Absorber Bench Test” in this section.

Install or Connect (Figures 34 through 36)
1. Shock absorber (113) to the frame (figure 36).
  - Insert the shock’s upper stud into the hole in the frame.
  - Washer (111) and nut (109). Do not tighten.

**NOTICE:** Refer to the “Notice” on page 3C-1 of this section.

2. Shock absorber (113) to the leaf spring spacer (158) (figure 36).
  - Position the shock’s lower mount onto the stud.
  - Washer (111) and nut (109).

Tighten
- Shock absorber upper nut to 185 N·m (136 ft. lbs.).

1. Stabilizer bar (166) from the stabilizer link (116).
   - Nut (115) and washer (114).
   - Use J-6627-A to separate the stabilizer link from the stabilizer end.

2. Stabilizer bar (166) from the frame (figure 37).
   - Nuts (170), washers (171), clamp bolts (169) and clamps (168).
   - Slide the insulator (167) from the stabilizer bar (166).

3. Stabilizer link (116) from the front axle (157) (figure 37).
   - Nut (136), retainer (117), insulator (118).
   - Pull the link from the axle. Another insulator (118) and retainer (117) will come off the link.

NOTICE: For steps 1, 2, and 3, refer to the “Notice” on page 3C-1 of this section.
Install or Connect (Figures 34, 35, and 37)

1. Stabilizer link (116) to the front axle (157) (figure 37).
   - Slide a retainer (117) and an insulator (118) on to the link and insert the link into the proper hole in the front axle.
   - Insulator (118), retainer (117) and nut (136).

Tighten
   - Nut (136) until the distance between each retainer (117) is 2.08 cm (0.82 inches) (figure 37).

2. Stabilizer bar (166) to the frame (figure 37).
   - Insulators (167) onto the stabilizer bar (166).
   - Clamps (168), clamp bolts (169), washers (171), and nuts (170).

Tighten
   - Nuts (170) to 28 N·m (21 ft. lbs.).

3. Stabilizer bar (166) to the stabilizer link (116).
   - Washer (114) and nut (115).

4. Wheel and tire assembly. Lower the vehicle to the ground.

WHEEL HUB/ROTOR ASSEMBLY

Remove or Disconnect (Figures 34 and 35)

- Raise the vehicle and support it with suitable safety stands. Remove the tire and wheel assembly.
1. Caliper (142).
   - Refer to BRAKES (SEC. 5).

NOTICE: Support the caliper with a piece of wire to prevent damage to the brake line.

2. Wheel hub/rotor (154) (figures 34, 35).
   - Retainer/cap (148).
   - Cotter pin (149), nut (150) and washer (151).
   - Pull the hub/rotor free from the spindle, making sure the outer wheel bearing (152) comes free.
• Do not damage the steering knuckle spindle threads.
3. Inner wheel bearing (155).
   • Pry out the seal (156).
4. Races.
   • Drive out each race using a brass drift.

Clean
1. Grease from the hub/rotor (154) and steering knuckle spindle.
   • Grease from inside the hub.
2. Grease from the wheel bearings (152, 155) and races.
   • Use clean solvent and a small brush (no loose bristles).
   • Do not spin the wheel bearings with compressed air to dry them—the wheel bearings may be damaged.

Inspect
1. Wheel bearings (152, 155) and their races for damage or wear.
   • Refer to "Diagnosis of Wheel Bearings," in this section.
   • If either a bearing or its race is damaged or worn, replace both.
2. Hub/rotor (154) for damage or wear.
   • Check for out-of-round or scored conditions.
   • Check for pitting or cracks.
   • Repair or replace as necessary.

Install or Connect (Figures 34 and 35)
Tools Required:
J-8092 Driver Handle
J-29040 Outer Bearing Race Installer
J-9746-02 Hub/Rotor Support

NOTICE: Start the races squarely inside the hub/rotor (154) to avoid distortion and possible cracking.
1. Races into the hub/rotor (154).
   • Place the hub/rotor on J-9746-02 and rest this assembly on press bars.
   • Use J-29040 to drive the outer bearing race into position.
   • Remove J-9746-02 and use a 7.6 cm (3 inch) diameter bar, or equivalent tool to drive the inner bearing race into position. If the bar is larger than 7.6 cm (3 inches), it may damage the bearing seal seat.

Important
• Use an approved high temperature front wheel bearing grease to lubricate the bearings. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).
• Do not mix different greases as mixing may change the grease's properties resulting in poor performance.
2. Apply a thin film of grease to the steering knuckle spindle at the outer wheel bearing seat and at the inner wheel bearing seat, shoulder, and seal seat.
3. Put a small quantity of grease inboard of each wheel bearing retainer/cap (148).
4. Fill each wheel bearing (cone and roller assembly) full of grease.
   • Use a cone-type grease machine that forces grease into the bearing.
   • If a cone-type grease machine is not available, pack the wheel bearing by hand.
   • When packing the wheel bearing by hand, work the grease into the bearings between the rollers, cones, and the cage.

NOTICE: Failure to completely pack the wheel bearing (cones, rollers, and cage) with grease will result in premature wheel bearing damage and/or wear.
5. Inner wheel bearing (155) into the hub/rotor (154).
   • Put an additional quantity of grease outboard of this bearing.
   • Use a flat plate or block to install the seal to insure it is flush with the hub/rotor flange.
   • Lubricate the seal lip with a thin layer of grease.
   • Do not damage the steering knuckle spindle threads.
8. Outer wheel bearing (152).
   • Slide it over the spindle until the wheel bearing (152) fully seats against the hub/rotor outer race.

NOTICE: Refer to the "Notice" on page 3C - 1 of this section.
9. Washer (151), nut (150) and cotter pin (149).
   • Do not place the cotter pin through the hole in the spindle until the wheel bearings are adjusted.

Tighten
• Nut (150) to 16 N·m (12 ft. lbs.) while turning the hub/rotor assembly in either direction.
10. Put an additional amount of grease outboard of the wheel bearing (152).
11. Adjust the wheel bearings.
   • Refer to "Wheel Bearing Adjustment," in this section.
12. Retainer/cap (148) in place.
13. Caliper (142).
   • Refer to BRAKES (SEC. 5).
14. Tire and wheel assembly. Lower the vehicle to the ground.

WHEEL BEARING ADJUSTMENT

Important
• The proper functioning of the front suspension cannot be maintained unless the front wheel bearings are correctly adjusted. The bearings must be a slip fit on the spindle and the inside diameter of the wheel bearing must be lubricated to ensure the bearings will creep. The spindle nut (150) must have a free-running fit on the spindle threads.
NOTICE: Never preload the front wheel bearings. Damage can result by the steady thrust on the roller ends which comes from preloading.

Adjust
- Raise the vehicle and support it with suitable safety stands under the lower control arms.
1. Remove the retainer/cap (148).
2. Remove the cotter pin (149).

Tighten
- Nut (150) to 16 N·m (12 ft. lbs.) while rotating the wheel and tire assembly (or the hub/rotor). This will seat the bearings.
3. Back off the nut (150) one flat.
   - If the hole in the spindle lines up with the slot in the nut, insert the cotter pin (149).
   - If they do not line up, back off the nut until they do—not more than one additional flat.

Measure
- Endplay in the hub/rotor should measure between 0.013–0.20 mm (0.0005–0.008 inches) when properly adjusted.
4. Install the retainer/cap (148).
5. Lower the vehicle to the ground.

WHEEL HUB BOLT

Remove or Disconnect
Tools Required:
J-9746-02 Hub/Rotor Support
1. Hub/rotor assembly from the vehicle.
   - Refer to "Wheel Hub/Rotor Assembly," in this section.

NOTICE: Place J-9746-02 between the press bars and the hub/rotor to protect the rotor surfaces.

2. Wheel hub bolts (153) with a press.
   - Support the hub/rotor (153) using J-9746-02 and the press bars.
   - Do not damage the wheel mounting surface on the hub/rotor flange.

Install or Connect

NOTICE: Refer to the “Notice” on page 3C–1 of this section.
1. Wheel hub bolts (153) into the hub/rotor (154).
   - Place four washers onto the bolt, then fasten a nut onto the bolt until the nut bottoms on the washers.
   - Tighten the nut until the bolt fully seats into the hub/rotor (154).
   - Remove the nut and washers.
2. Hub/rotor to the vehicle.
   - Refer to "Wheel Hub/Rotor Assembly," in this section.

3. Wheel and tire assembly. Lower the vehicle to the ground.

STEERING ARM, KNuckle AND SPINDLe

Remove or Disconnect (Figures 34 and 35)
- Raise the vehicle and support it with suitable safety stands. Remove the tire and wheel assembly.
1. Caliper (142).
   - Refer to BRAKES (SEC. 5).
   - Refer to "Wheel Hub/Rotor Assembly," in this section.
3. Anchor plate (145), splash shield (141), and the steering arm (140).
   - Bolts (148), washers (147) and nuts (129), and pull the anchor plate and splash shield off the knuckle. Steering arm hangs by tie rods.
   - Bolts (144) and washers (143) to separate the anchor plate from the splash shield.
   - Refer to STEERING LINKAGE (SEC. 3B1) to separate the steering arm from the tie rod and pitman arm.
4. Caps (122) from the steering knuckle (127).
   - Bolts (119) and washers (120).
   - Brake hose bracket (121).
   - Gaskets (123) come off.
5. Lock pin (134).
   - Nut (132) and washer (133).
6. King pin (124) from the steering knuckle (127).
   - Drive it out using a drift.
   - Spacers (126) and bushings (125) will also come out.
7. Steering knuckle (127) from the axle (157).
   - Dust seal (130), shim (131), and thrust bearing (137) will come free.

NOTICE: For steps 3, 4, and 5 refer to the “Notice” on page 3C–1 of this section.

Install or Connect (Figures 34 and 35)
1. Bushings (125).
   - Ream new bushings to 29.982–30.022mm (1.1804–1.1820 in.) after installing.
2. Steering knuckle (127).
   - Thrust bearing (137), shim and the dust seal.
   - Prelube the thrust bearing. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).
3. King pin (124) and the lock pin (134).
   - Insert the spacers in the proper order.
   - Prelube the king pin.
   - Washer (133) and the nut (132).

Tighten
- Nut (132) to 40 N·m (29 ft. lbs.).
4. Caps (122) to the steering knuckle (127).
Gaskets (123) in place.
Brake hose bracket (121).
Washers (120) and bolts (119).

5. Steering arm (140), splash shield (141), and the anchor plate (145).
   • Bolts (144) and washers (143) to attach the splash shield to the anchor plate.
   • Bolts (146), washers (147) and nuts (129) to attach the anchor plate and steering arm to the steering knuckle.

6. Steering arm (140) to the steering linkage.
   • Refer to STEERING LINKAGE (SEC. 3B1).

   • Refer to "Wheel Hub/Rotor Assembly," in this section.

8. Adjust the wheel bearings.
   • Refer to "Wheel Bearing Adjustment," in this section.

9. Caliper (142).
   • Refer to BRAKES (SEC. 5).

10. Wheel and tire assembly. Lower the vehicle to the ground.

11. Check the front end alignment.
    • Refer to FRONT END ALIGNMENT (SEC. 3A).

FRONT AXLE

Remove or Disconnect (Figures 34 through 38)

Tools Required:
   J-6627-A Wheel Stud and Tie Rod Remover
   • Raise the vehicle and support it with suitable safety stands on the frame. Remove the wheel and tire assembly. Support the axle with a floor jack to eliminate any load on the springs.
1. Steering arm, knuckle, and spindle.
   • Refer to "Steering Arm, Knuckle, and Spindle," in this section.
2. Shock absorber (113) from the axle (157) (figure 36).
   • Nut (109) and washer (111).
3. Stabilizer link (116) from the stabilizer bar (166) (figure 37).
   • Nut (115) and washer (114).
   Use J-6627-A to separate the stabilizer bar from the stabilizer link.
4. Stabilizer link (116) from the axle (157) (figure 37).
   • Nut (136), retainer (117) and insulator (118).
   • Pull the link free from the axle, making sure not to loose the other insulator (118) and retainer (117).
5. Leaf spring (162) from the axle (157) (figure 38).
   • Nuts (135), washers (105) and U-bolts (165).
   • Spacer (164), and spring spacer (158).
6. Steering damper from the axle.
   • Refer to STEERING LINKAGE (SEC. 3B1).
7. Lower the floor jack and pull the axle clear of the vehicle.

LEAF SPRINGS

Remove or Disconnect (Figures 34 through 38)

Tools Required:
   J-6627-A Wheel Stud and Tie Rod Remover
   • Raise the vehicle and support it with suitable safety stands. Support the axle separately to eliminate any load on the springs. Remove the tire and wheel assembly.
1. Shock absorber (113) from the axle (157) (figure 36).
   • Nut (109) and washer (111).
2. Stabilizer link (116) from the stabilizer bar (166) (figure 37).
   • Nut (115) and washer (114).
   Use J-6627-A to separate the stabilizer bar from the stabilizer link.
3. Stabilizer link (116) from the axle (157) (figure 37).
   • Nut (136), retainer (117), insulator (118).
   • Pull the link free from the axle, making sure not to loose the other insulator (118) and retainer (117).
4. Leaf spring (162) from the axle (157) (figure 38).
Figure 38—Axle and Leaf Spring Attachment Points

- Nuts (135), washers (105) and U-bolts (165).
- Spacer (164) and spring spacer (158).

5. Leaf spring (162) from the frame (figure 38).
- Nut (108), washer (105), bolt (106) and washer (105) to separate the spring from the rear shackle (107).
- Nut (108), washer (105), bolt (106), and washer (105) to separate the spring from the front hanger (173).
- Pull the leaf spring backward and out.

NOTICE: For steps 1, 2, 3, 4 and 5, refer to the “Notice” on page 3C-1 of this section.

Install or Connect (Figures 34 through 38).

1. Leaf spring (162) to the frame (figure 38).
- Line up the spring with the rear shackle (107) and the front hanger (173). Double wrap end is toward the front of the vehicle.

2. Leaf spring (162) to the axle (157) (figure 38).
- Position the spring spacer (158) onto the axle. Either aligning pin can contact the edge of the leaf spring after the assembly is complete.
- Spacer (164), U-bolts (165), washers (105) and nuts (135). Tighten nuts to 25 N-m (18 ft. lbs.) in a diagonal sequence (e.g., 1-3-4-2).

Tighten
- Nut (108) to 125 N·m (92 ft. lbs.).

3. Stabilizer link (116) to the axle (157) (figure 37).
- Washer (105), bolt (106), washer (105) and nut (108) to attach the spring to the front hanger (173).
- Washer (105), bolt (106), washer (105) and nut (108) to attach the spring to the rear shackle (107).
• Insert the link into the proper hole in the axle after the retainer (117) and insulator (118) are attached.
• Insulator (118), retainer (117), and nut (136).

4. Stabilizer link (116) to the stabilizer bar (166) (figure 37).
   • Washer (114) and nut (115).

5. Stabilizer link (116) to the stabilizer bar (166) (figure 37).
   • Nut (115) to 68 N·m (50 ft. lbs.).

6. Shock absorber (113) to the axle (157) (figure 34).
   • Washer (111) and nut (109).

ON-VEHICLE SERVICE:
FOUR WHEEL DRIVE FRONT SUSPENSION

SHOCK ABSORBER

Remove or Disconnect (Figures 39 through 41)

• Raise the vehicle on a hoist.
1. Shock absorber (220) from the frame.
   • Nut (212), washer (213) and bolt (219) (figure 38).
2. Shock absorber (220) from the axle.
   • Nut (212), washer (213) and bolt (225).
   • Quad shocks (RPO Z75) have a spacer (246) between them (figure 41).

Inspect

• Shock absorbers for damage and leaking.
• Test the shock absorbers. Refer to “Shock Absorber Bench Test” in this section.

NOTICE: For steps 1 and 2, refer to the “Notice” on page 3C – 1.

Install or Connect (Figures 39 and 40)

1. Shock absorber (220) to the axle.
   • Bolt (225), washer (213), and nut (212).
   • Spacer (246) must be positioned between the shock absorbers (220) on vehicles with quad shocks, RPO Z75 (figure 41).

Tighten

• Nut (212) to 88 N·m (65 ft. lbs.).
• Nut (212) to 120 N·m (89 ft. lbs.) on quad shocks (RPO Z75).

2. Shock absorber (220) to the frame.
   • Bolt (219), washer (213) and nut (212).

Tighten

• Nut (212) to 88 N·m (65 ft. lbs.).

3. Lower the vehicle to the floor.

STABILIZER BAR

Remove or Disconnect (Figures 39, 40 and 42)

• Raise the vehicle on a hoist.
1. Stabilizer bar (230) from the frame brackets (237).
   • Nuts (231), washers (232), brackets (233), and bolts (238) (figure 39).
2. Stabilizer bar (230) from the spring plate (224).
   • Bolts (229), and washers (228).
   • Stabilizer bar is free of the vehicle.
   • Bushings (234) can be removed from the stabilizer bar.

Install or Connect (Figures 39, 40 and 42)

1. Stabilizer bar (230) to the frame brackets (237).
   • Bushings (234) onto the stabilizer bar.
   • Use rubber lubricant when installing the bushings (slit faces forward) on the stabilizer bar.
   • Brackets (233), bolts (238), washers (232), and nuts (231) (figure 39). Do not tighten.

NOTICE: Refer to “Notice” on page 3C – 1 of this section.

2. Stabilizer bar (230) to the spring plate (224).
   • Washers (228) and bolts (229) (figure 42).

Tighten

• Nuts (231) to 70 N·m (52 ft. lbs.).
• Bolts (229) to 180 N·m (133 ft. lbs.).

3. Lower the vehicle to the ground.

WHEEL HUB/ROTOR ASSEMBLY

Remove or Disconnect (Figures 39, 40, and 43 through 45)

Tools Required:

J-6893-D Wheel Bearing Nut Wrench (V10/1500-20/2500 Models)
J-23446 Torque Wrench Adapter
J-26878-A Wheel Bearing Nut Wrench (V30/3500 Models)
• Raise the vehicle and support it with suitable safety stands. Remove the tire and wheel assembly.

1. Caliper
   • Refer to BRAKES (SEC. 5).

2. Locking hub (249).
   • Refer to FRONT AXLE (SEC. 4C).

3. Locking nut (250), ring (251) and adjusting nut (252).
   • Use J-6893-D and J-23446 for V10/1500-20/2500 models.
   • Use J-26878-A for V30/3500 models.

4. Hub/Rotor Assembly (257).
   • Outer wheel bearing (253) will slide off the spindle (265) ahead of the hub/rotor (257).
   • Use a brass drift and hammer for the seal (260) and races (254, 258).
   • The inner bearing (259), race (258) are behind the seal (260).

Inspect

1. Rotor braking surfaces for scoring, pitting, or cracks.
   • Repair or replace as necessary.

2. Wheel bearings (253, 259) and races (254, 258).
   • Refer to “Diagnosis of Wheel Bearings,” in this section.
   • If either a bearing or its race is damaged or worn, replace both.

Install or Connect (Figures 39, 40, and 43 through 45)

Tools Required:
- J-8092 Driver Handle
- J-6368 Bearing Race Installer (Outer)
- J-23448 Bearing Race Installer (Inner)
- J-6893-D Wheel Bearing Nut Wrench (V10/1500-20/2500 models)
- J-26878-A Wheel Bearing Nut Wrench (V30/3500 models)
- J-23446 Torque Wrench Adapter

1. Races (254, 258) into the rotor/hub (257).
   • Use J-8092 and J-6368 for installation of the outer bearing outer race (254).
   • Use J-8092 and J-23448 for installation of the inner bearing outer race (258).
   • Do not damage the hub/rotor during the race installations.

Clean

- Grease from the rotor/hub (257) and spindle (265).
- Grease from the wheel bearings (253, 259).
- Use clean solvent and a small brush (no loose bristles).
- Do not spin the wheel bearings with compressed air to dry them—the wheel bearings may be damaged.

Important

- Use an approved high-temperature front wheel bearing grease. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).
- Do not mix greases as mixing may change the grease’s properties resulting in poor performance.
- Apply a thin film of grease to the spindle at the outer wheel bearing seat and at the inner wheel bearing seat, shoulder, and seal seat.

3. Put a small quantity of grease inboard of each wheel bearing cup, inside the rotor/hub (257).

4. Fill the wheel bearing (cone and roller assemblies) full of grease.
   • Use a cone-type grease packer that forces grease into the bearing.
   • If a cone-type grease packer is not available, pack the wheel bearings by hand.
   • If packing the wheel bearings by hand, work the grease into the bearings between the rollers, cones, and the cage.

NOTICE: Failure to completely pack the wheel bearings (cones, rollers, and cage) with grease will result in premature wheel bearing damage and/or wear.

5. Inner wheel bearing (259) into the rotor/hub (257).
   • Put an additional quantity of grease outboard of this wheel bearing.

   • Use a flat plate to install the seal so it is flush with the rotor/hub flange.
   • Lubricate the seal lip with a thin layer of grease.

7. Rotor/hub (257).
   • Do not damage the spindle threads.

8. Outer wheel bearing (253).
   • Press on the spindle until the wheel bearing fully seats against the rotor/hub outer race.

10. Adjust the wheel bearing.
    • Refer to “Wheel Bearing Adjustment,” in this section.

NOTICE: Refer to the “Notice” on page 3C–1 of this section.

11. Ring (251) and locking nut (250).
    • Tang on the inside diameter of the ring must pass onto the slot on the spindle (265).
    • The hole in the ring must align with the pin on the lock nut (250). Move the adjustment nut (252) to align the pin.
    • Use J-6893-D or J-26878-A and J-23446.

12. Locking hub (249).
    • Refer to FRONT AXLE (SEC. 4C).

13. Caliper.
    • Refer to BRAKES (SEC. 5).

14. Wheel and tire. Lower the vehicle to the ground.

BEARING ADJUSTMENT

Important

- The proper functioning of the front suspension cannot be maintained unless the front wheel bearings are correctly adjusted. The cones must be a slip fit on the spindle and the inside diameter of the cones must be lubricated to insure the cones will creep. The adjusting nut must have a free-running fit on the spindle threads.

Figure 40—V Model Front Suspension

Figure 41—Shock Absorber Attachment Points
Adjust

- Raise the vehicle and support it with safety stands.

1. Remove the locking hub assembly (249), lock nut (250), and the ring (251).

Tighten

- Adjusting nut (252) to 60 N·m (50 ft. lbs.) while rotating the hub/rotor in order to seat the bearings.

2. Back off the adjusting nut (252) and retighten.

Tighten

- For Automatic Hubs, torque the adjusting nut to 47 N·m (35 ft. lbs.) while rotating the wheel.
- For Manual Hubs, torque the adjusting nut to 60 N·m (50 ft. lbs.) while rotating the wheel.

3. Back off the adjusting nut (252).

- For Automatic hubs, back off 3/8 of a turn maximum.
- For Manual hubs, back off enough to free the bearing.

4. Ring (251) and lock nut (252).

- Tang on the inside diameter of the ring must pass onto the slot on the spindle (265).
- The hole in the ring must align with the pin on the lock nut (250). Move the adjustment nut (252) to align the pin.

Tighten

- Lock nut (250) to 217 N·m (160 ft. lbs.) minimum.

Measure

- Endplay in the hub/rotor assembly. It should be set between 0.025 to 0.254 mm (0.001 to 0.010-inch).

5. Locking hub assembly (249).

- Refer to FRONT AXLE (SEC. 4C).

6. Lower the vehicle to the ground.
WHEEL HUB BOLT

Remove or Disconnect (Figures 39, 40, and 46)
Tools Required:
J-9746-02 Hub/Rotor Support
1. Hub/rotor assembly from the vehicle.
   - Refer to "Wheel Hub/Rotor Assembly," in this section.
2. Wheel hub bolts (255) with a press.
   - Support the hub/rotor using J-9746-02 to prevent damage to the rotor face (figure 46).
   - Do not damage the wheel mounting surface on the hub/rotor flange.

Install or Connect (Figures 39, 40, and 47)
Tools Required:
J-9746-02 Hub/Rotor Support

NOTICE: Refer to "Notice" on page 3C-1 of this section.
1. New, serrated bolt (255) into the hole in the hub/rotor.
   - Place four washers onto the bolt, then fasten a nut onto the bolt until the nut bottoms on the washers (figure 47).
   - Tighten the nut until the bolt fully seats into the hub/rotor.
   - Remove the nut and washers.
2. Hub/rotor to the vehicle.
   - Refer to "Wheel Hub/Rotor Assembly," in this section.
3. Wheel and tire assembly. Lower the vehicle.

SPINDLE

Remove or Disconnect (Figures 39, 40, 48 and 49)
- Raise the vehicle and support it with suitable safety stands. Remove the tire and wheel assembly.
Figure 44—Knuckle and Hub/Rotor Components (V30/3500 Models)
Figure 45—Knuckle and Hub/Rotor Components (V30/3500)

1. Wheel hub/rotor assembly.
   - Refer to “Wheel Hub/Rotor Assembly,” in this section.

2. Spindle (265) from the steering knuckle (274).
   - Nuts (261) and plate (263) for V10/1500–20/2500 models.
   - Nuts (261), washers (262), plate (263) and the bracket (264) for V30/3500 models.
   - Tap the end of the spindle with a plastic or rubber mallet to break it loose from the steering knuckle (274) (figure 48).

Figure 46—Removing the Hub Bolts

NOTICE: The machined surface of the spindle must not be damaged by vise jaws.

3. Spindle components.
   - Secure the spindle in a vise by locating on the high step diameter.

- Bearing seal (267) and shaft bearing (266) (figure 49).
- Spacer (268), seal (269), and oil deflector (270) from the axle shaft (figure 49).

Inspect
- Spacer (268). Replace if it is worn.
- Spindle (265) for any heat burns, scoring, or wear. Replace if necessary.

Install or Connect (Figures 39, 40, 49 and 50)

Tools Required:
- J-23445-A Needle Bearing Installer (V10/1500-20/2500 models)
- J-8092 Driver Handle
- J-21465-17 Bearing Installer (V30/3500 models)
- Relubricate the shaft bearing (266) and the spindle (265) with a high melting point type wheel bearing grease. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).

1. Shaft bearing (266) and bearing seal (267) into the spindle (265) (figure 47).
   - For V10/1500-20/2500 models, use J-8092 and J-23445-A.
   - For V30/3500 models, use J-8092 and J-21465-17.

2. Oil deflector (270) and seal (269) onto the axle shaft.
   - Seal (269) onto the oil deflector (270) with the deflector lip toward the spindle (265).

3. Spacer (268) onto the axle shaft.
   - The chamfer points toward the oil deflector (270) (figure 50).

4. Spindle (265) onto the steering knuckle (274).
   - Slide the spindle over the axle shaft until it seats on the steering knuckle. The bolts (278) must protrude through the spindle.

   NOTICE: Refer to “Notice” on page 3C-1 of this section.

5. Bracket (264) and plate (263).
   - Only the V30/3500 models use a bracket (264).
Figure 51—Tightening the Adjusting Ring

- Washers (262) (V30/3500 models only) and NEW nuts (261).

**Tighten**
- Nuts (261) to 88 N·m (65 ft. lbs.).

   - Refer to "Wheel Hub/Rotor Assembly," in this section.

7. Wheel and tire. Lower the vehicle to the ground.

**STEERING KNUCKLE AND ARM**

**V10/1500-20/2500 MODELS (WITH BALL JOINTS)**

**Remove or Disconnect (Figures 39, 40, and 51)**

- Raise the vehicle and support with suitable safety stands. Remove the tire and wheel assembly.
1. Locking hub assembly (249).
   - Refer to FRONT AXLE (SEC. 4C).
2. Wheel hub/rotor assembly.
   - Refer to "Wheel Hub/Rotor Assembly," in this section.
3. Spindle (265) from the steering knuckle (274).
   - Refer to "Spindle," in this section.
4. Tie rod from the steering arm (297).
   - Refer to STEERING LINKAGE (SEC. 3B1).
5. Steering arm (297) from the steering knuckle (274).
   - Nuts (295) and adapters (296).
   - Discard the nuts (295).

**NOTICE:** Do not remove the adjusting ring (300) unless new ball joints are being installed. If it is necessary to loosen the ring to remove the knuckle, do not loosen it more than two threads. Use J-23447 (figure 51). The nonhardened threads in the yoke can be easily damaged by the hardened threads in the adjusting ring if caution is not used during knuckle removal.

6. Steering knuckle (274) from the axle yoke.
   - Cotter pin (298), nuts (292, 299).

7. Spindle (265) from the steering knuckle (274).
   - Nuts (295) and adapters (296).
   - Discard the nuts (295).

- Insert a wedge-shaped tool between the lower ball joint (293) and the yoke. Tap on the tool to release the knuckle assembly.
- Insert the wedge-shaped tool between the upper ball joint (294) and the yoke. Tap on the tool to release the knuckle assembly.

**NOTICE:** For steps 2, 3, 4, 6 and 7, refer to "Notice" on page 3C - 1 of this section.

**Tools Required:**
- J-23447 Ball Stud Nut Wrench

1. Torque the upper ball joint nut (299).
   - Nut (299) to 135 N·m (100 ft. lbs.).

2. Cotter pin (298) into the nut (299).
   - Do not loosen the nut. Apply additional torque, if necessary, to line up the hole in the ball joint with the slot in the nut.

3. Apply the final torque to the lower ball joint nut (292).
   - Nut (292) to 95 N·m (70 ft. lbs.).

4. Tie rod to the steering arm (297).
   - Refer to STEERING LINKAGE (SEC. 3B1).

5. Spindle (265) to the steering knuckle (274).
   - Refer to "Spindle," in this section.

6. Lower the vehicle to the ground.
V30/3500 MODELS (WITH KING PINS)

+++ Remove or Disconnect (Figures 39, 40, and 52 through 55)

Tools Required:
- J-26871 King Pin Socket
- Raise the vehicle and support with suitable safety stands. Remove the tire and wheel assembly.

1. Locking hub (249).
   - Refer to FRONT AXLE (SEC. 4C).
2. Wheel hub/rotor assembly.
   - Refer to "Wheel Hub/Rotor Assembly," in this section.
3. Spindle (265).
   - Refer to "Spindle," in this section.
4. Upper cap (273) and/or steering arm (290).
   - For the cap, remove the bolts (271) and washers (272) alternately as the compression spring will force the cap up.
5. Gasket (289), and compression spring (288).
   - Bolts (271) and washers (272) (figure 53).
7. Upper king pin bushing (287).
   - Pull it out through the steering knuckle (274).
8. Steering knuckle (274) from the axle yoke.
   - Seal (301).
9. Upper king pin (279) from the axle yoke.
   - Use a large breaker bar and J-26871 (figure 54).
   - Apply 677–813 N·m (500–600 ft. lbs.) of torque to break the king pin free.
10. Retainer (281), race (282), bearing (283) and the seal (284) from the axle yoke.
    - Punch all the components out at once (figure 55).
    - Discard the old seal (284).
    - If the retainer (281) is damaged, discard it.

For the steering arm, remove the nuts (291) alternately as the compression spring will force the steering arm up (figure 52).

Figure 52—Removing the Cap and Steering Arm Fasteners

Figure 54—Removing the Upper King Pin

Figure 55—Removing the Retainer, Race, Bearing and the Seal
Install or Connect (Figures 40, 41 and 56 through 58)

Tools Required:
J-7817 Front Pinion Bearing Installer
J-22301 King Pin Bearing Seal Installer
J-28871 King Pin Installer

1. Retainer (281) and the race (282).
   • Use a new retainer.
   • Use J-7817 (figure 56).
2. Fill the area in the retainer (281) and race with an approved high temperature bearing lubricant. Grease the bearing (282).
   • Use a cone-type grease packer that forces grease into the bearing.
   • If a cone-type grease packer is not available, pack the bearing by hand. Work the grease between the rollers, cones, and cage.

NOTICE: Failure to completely pack the bearing (cones, rollers, and cage) with grease will result in premature bearing damage and/or wear.

3. Bearing (283) and seal (284).
   • Use J-22301 to install the NEW seal (Figure 57).
   • Do not distort the seal. It will protrude slightly from the surface of the axle yoke flange when fully seated.
4. Upper king pin (279).
   • Use J-28871 (figure 58).

Tighten

5. Steering knuckle (274) and bushing (287).
   • Felt seal (280) to the king pin (279) through the steering knuckle.
   • Knuckle onto the king pin (279).
   • Place the bushing (287) over the king pin (279).
6. Bearing cap and king pin (285) to the steering knuckle (278).
   • 4 bolts (271) and washers (272).

Tighten

7. Steering arm (290) to the steering knuckle (274).
   • Compression ring (288), gasket (289), and steering arm (290).
   • Nuts (291).

Tighten

8. Spindle (265).
   • Refer to "Spindle," in this section.
   • Refer to "Wheel Hub/Rotor Assembly," in this section.
10. Adjust the wheel bearings.
3C-48 FRONT SUSPENSION

13. Check the front end alignment.
- Refer to FRONT END ALIGNMENT (SEC. 3A).
14. Lower the vehicle to the ground.

BALL JOINTS (V10/1500–20/2500 MODELS ONLY)

Remove or Disconnect (Figures 39, 40, 59 and 60)

Tools Required:
J-9519-10 Ball Joint Fixture
J-23454-1 Lower Ball Joint Spacer
J-23454-3 or
J-6382 Upper Ball Joint Spacer
J-23454-4 Upper and Lower Ball Joint Sleeve

Figure 60—Removing the Upper Ball Joint

Figure 61—Installing the Lower Ball Joint

- Raise the vehicle and support with suitable safety stands. Remove the wheel and tire assembly.
1. Wheel hub/rotor assembly.
- Refer to "Wheel Hub/Rotor Assembly," in this section.
2. Spindle.
- Refer to "Spindle," in this section.
3. Steering knuckle (274) and steering arm (290).
- Remove the steering arm (290) only if removing the left axle yoke ball joints.
- Refer to "Steering Knuckle and Arm," in this section.
- Place the steering knuckle in a vise (figure 59).
4. Lower ball joint (293).
- Must be removed before any service can be done to the upper ball joint (294).
- Snap ring from the lower ball joint (293).
- Use J-9519-10, J-23454-1, J-23454-4 or equivalent (figure 59). Tighten until the ball joint breaks free of the steering knuckle.
5. Upper ball joint (294).
- Use J-9519-10, J-23454-3 (or J-6382-3) and J-23454-4 (figure 60). Tighten until the ball joint breaks free of the steering knuckle.

Install or Connect (Figures 39, 40, 61 and 62)

Tools Required:
J-9519-10 Ball Joint Fixture
J-23454-2 Upper and Lower Ball Joint Sleeve
J-23454-3 or
J-6382-3 Upper and Lower Ball Joint Spacer
1. Lower ball joint (293) into the steering knuckle (274).
- The ball joint (no cotter pin hole in the threaded end) must be positioned straight.
- Use J-9519-10, J-23454-2, and J-23454-3 or J-6382-3 (figure 61). Tighten until the ball joint fully seats.
- Snap ring in position.
2. Upper ball joint (294) into the steering knuckle (274).
- Use J-9519-10, J-23454-2, and J-23454-3 or J-6382-3 (figure 62). Tighten until the ball joint fully seats.
3. Steering arm (290) and steering knuckle (274).
FRONT SUSPENSION 3C-49

Figure 62—Installing the Upper Ball Joint

- Steering arm only if removed.
- Refer to "Steering Knuckle and Arm," in this section.

4. Spindle (265).
   - Refer to "Spindle," in this section.

5. Wheel hub/rotor assembly.
   - Refer to "Wheel Hub/Rotor Assembly," in this section.

6. Adjust the wheel bearings.
   - Refer to "Wheel Bearing Adjustment," in this section.

7. Wheel and tire assembly.
8. Check the front end alignment.
   - Refer to FRONT END ALIGNMENT (SEC. 4C).

9. Lower the vehicle to the ground.

LEAF SPRING AND BUSHINGS

Remove or Disconnect (Figures 39, 40, and 63)

- Raise the vehicle on a hoist and support the front axle with a floor jack. Raise the floor jack until all tension is relieved from the springs.

1. Spring (221) from the frame.
   - Nut (218), washer (217), shackle (202), bolt (201), bushings (203) and spacer (216) (figure 61).

2. Spring (221) from the hanger (241).
   - Nut (239), washers (240), and bolt (242) (figure 61).

3. Spring (221) from the axle.
   - For V10/1500–20/2500 and the left side of V30/3500 models, remove nuts (222), washers (223), U-bolts (227), plate (224) and the spacers (226).
   - For the right side of V30/3500 models, remove the bolts (248), nuts (222), washers (223), U-bolt (227), plate (224) and the spacers (226) (figure 63).

4. Shackle (202) from the spring (221).
   - Nut (218), washer (217), bolt (201), bushings (203) and spacer (216) (figure 63).

5. Bushing from the spring eye.

Install or Connect (Figures 39, 40, 63 and 64)

1. Bushing into the spring eye.
   - Press in a new bushing, making sure the tool presses on the steel outer shell of the bushing.
   - Bushing must protrude an equal amount on either side of the spring eye when properly installed.

2. Shackle (202) into the spring (221).
   - Spacer (216), bushings (203), washers (217), bolt (201) and nut (218).
   - Do not tighten.

3. Upper spacer (226) onto the spring (221).

4. Spring into the hanger (241).
   - Bolt (242), washers (240) and nut (239).
   - Do not tighten.

5. Spring into the frame.
   - Bushings (203) and the spacer (216) into the frame.
   - Shackle (202) into position and attach bolt (201), washer (217) and nut (218).
   - Do not tighten.

NOTICE: Refer to the "Notice" on page 3C–1 of this section.

6. Spring to the axle.
   - For V10/1500–20/2500 models and the left side of V30/3500 models, attach the lower spacer (226), plate (224), U-bolts (227), washers (223) and nuts (222) (figure 63).
   - For the right side of V30/3500 models, attach the lower spacer (226), plate (224), U-bolt (227), washers (223), bolts (248) and nuts (222) (figure 63).

Tighten

- Nuts (222) and bolts (248) in sequence (2-4-1-3) to 203 N·m (150 ft. lbs.) (figure 64).

6. Torque the spring to frame and hanger fasteners.
   - Nuts (239) to 122 N·m (90 ft. lbs.).
   - Nuts (218) to 68 N·m (50 ft. lbs.).

7. Lower the floor jack, and lower the vehicle to the ground.

• Place the spring in a press and press out the bushing using a suitable rod, pipe, or tool.

REAR SUSPENSION

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology "Notice: Refer to the 'Notice' on page 3D-1 of this section.

NOTICE: These rear suspension fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of these parts.

GENERAL DESCRIPTION

All 10/1500 through 30/3500 series vehicles use a leaf spring and solid rear axle suspension system (figures 1 through 7).

The rear axle assembly is attached to multi-leaf springs by U-bolts. The front ends of the springs are attached to the frame at the front hangers, through rubber bushings. The rear ends of the springs are attached to the frame by the use of shackles which allow the springs to "change their length" while the vehicle is in motion.

Ride control is provided by two identical direct double acting shock absorbers angle-mounted between the frame and brackets attached to the axle tubes.

### SHOCK ABSORBER REPLACEMENT

**Remove or Disconnect (Figures 1 through 7)**

- Raise the vehicle on a hoist.
  1. Shock absorber (13) from the frame.
     - For R/V and P series vehicles; nut (16), spring-washer (15), and/or washer (21).
     - For G series vehicles; nut (16), spring washer (15), washer (3), and bolt (38).
  2. Shock absorber (13) from the axle.
     - Nut (11), spring-washer (12), and bolt (14).
     - Pull the shock absorber free.

**Install or Connect (Figures 1 through 7)**

1. Shock absorber (13) to the frame.
   - For R/V and P series vehicles; spring-washer (15) and/or washer (21), plus the nut (16).
   - For G series vehicles; bolt (38), washer (3), spring-washer (15), and nut (16).

2. Shock absorber (13) to the axle.
   - Line shock absorber up with the axle bracket.
   - Bolt (14), spring-washer (12), and nut (11).

3. Lower the vehicle to the ground.

### STABILIZER BAR REPLACEMENT

**Remove or Disconnect (Figures 8, 9, and 10)**

- Raise the vehicle on a hoist.
  1. Stabilizer bar (108) from the frame.
     - For R 30/3500 series vehicles; nut (120), and washer (116). Slide the link bolt (115) out along with the grommets (117), washers (116), and link (118).
     - For P 30/3500 series vehicles; nuts (105), washers (106), bolts (111), and the clamp (110).
  2. Stabilizer bar (108) from the anchor plates (107).
     - Nuts (105), washers (106), bolts (111), and the clamps (110).
  3. Insulators (109) from the stabilizer bar (108).

**Install or Connect (Figures 8, 9 and 10)**

1. Insulators (109) to the stabilizer bar (108).
2. Stabilizer bar (108) to the anchor plates (107).
   - Clamps (110), bolts (111), washers (106), and nuts (105).

**Tighten**

- Refer to "Specifications" at the end of this section.

3. Stabilizer bar (108) to the frame.

---

**NOTICE:** For steps 1 and 2, refer to the “Notice” on page 3D-1 of this section.

**Important**

- Route the parking brake cable over the stabilizer bar.
- Stabilizer bar (108) to the frame.
For the R 30/3500 series vehicles; position the link bolt (115), washers (116), grommets (117), link (118), retainer (119) and nut (120).

For the P 30/3500 series vehicles; attach the clamp (110), bolts (111), washers (106), and nuts (105) in position.

Tighten
- Nuts (120 and 105) to the “Specifications” at the end of this section.

4. Lower the vehicle to the ground.

---

**LEAF SPRING ASSEMBLY REPLACEMENT**

**Remove or Disconnect (Figures 1 through 7)**
- Raise the vehicle on a hoist and support the rear axle independently to relieve tension on the leaf springs.
  1. Stabilizer bar from the vehicle if equipped.
    - Refer to “Stabilizer Bar Replacement,” in this section.
  2. Leaf spring (10) from the rear hanger (25).
    - Loosen, but do not remove, the spring-to-shackle nut and bolt.
    - Nut and bolt securing the shackle to the rear hanger (25).
  3. Leaf spring (10) from the front hanger (18).
    - Nut and the bolt securing the leaf spring (10) to the front hanger (18).
  4. Shackle (6) from the leaf spring (10).
    - Nut and bolt securing the shackle to the leaf spring.
  5. Leaf spring from the axle.
    - Nuts (22), and washers (21).
    - Rear stabilizer anchor (36) if equipped, the anchor plate, spacers, shims, and the auxiliary spring (32), if equipped.
    - U-bolts (8).
    - Leaf spring is free of the vehicle.
3D-10 REAR SUSPENSION

Install or Connect (Figures 1 through 7, and 11)

NOTICE: For steps 1 and 4, refer to the "Notice" on page 3D-1 of this section.

1. Leaf spring (10) to the rear axle.
   • Leaf spring into position.
   • Spacers, shims, the auxiliary spring (32) if equipped, and the anchor plate.
   • U-bolts (8), washers (21), and nuts (22).

   Tighten
   • Nuts (22), in a diagonal sequence as shown in figure 11, initially to 25 N·m (18 ft. lbs.). Then final torque in a diagonal sequence as shown in figure 11 to the "Specifications" at the end of this section.

2. Shackle (6) to the leaf spring (10).
   • Bolt (2), washers (3), and nuts (5), making sure the bolt is positioned correctly (figures 1 through 7).
   • Do not tighten.

3. Leaf spring to the front hanger (18).
   • Bolt (2), washers (3), and nut (5).
   • Do not tighten.

4. Leaf spring to the rear hanger (25).
   • Bolt (2), washers (3), and nut (5).

Figure 11—Spring to Axle Tightening Sequence

Tighten
• Nuts (5) and bolts (2), to the "Specifications" at the end of this section.

5. Stabilizer bar to the vehicle if equipped.
   • Refer to "Stabilizer Bar Replacement," in this section.

6. Lower the support on the rear axle. Lower the vehicle to the ground.

BUSHING REPLACEMENT

PRESS OUT TYPE BUSHINGS

Remove or Disconnect (Figures 1, 3, and 7)

1. Leaf spring (10) from the vehicle.
   • Refer to "Leaf Spring Assembly Replacement," in this section.

2. Bushing from the leaf spring (10).
   • Place the leaf spring in a press and press out the bushing.

Install or Connect (Figures 1, 3 and 7)

1. Bushing into the leaf spring (10).
   • Use a press to properly position the bushings.

2. Leaf spring (10) to the vehicle.
   • Refer to "Leaf Spring Assembly Replacement," in this section.
PRY OUT TYPE BUSHINGS

Remove or Disconnect (Figures 2 and 4 through 7)

1. Leaf spring (10) from the vehicle.
   • Refer to "Leaf Spring Assembly Replacement," in this section.
2. Bushings (26) from the leaf spring (10).
   • Pry the bushings out of each side of the spring eye.

Install or Connect (Figures 2 and 4 through 7)

1. Bushings (26) into the leaf spring (10).
   • Press each bushing (26) into its side of the spring eye.
2. Leaf spring (10) onto the vehicle.
   • Refer to "Leaf Spring Assembly Replacement," in this section.

GENERAL DESCRIPTION

This section details special service procedures that are not covered in the vehicle’s Owner’s Manual. For jacking instructions, basic tire changing and rotation instructions, and a detailed explanation of all other owner-oriented information, refer to the proper section in the vehicle’s Owner’s Manual.

CERTIFICATION LABEL

The certification label contains information used to determine which tire size and type the vehicle uses. For further information, refer to GENERAL INFORMATION (SEC. 0A).

TIRE LOAD LIMITS AND INFLATION PRESSURE

The factory installed wheels and tires are designed to handle loads up to and including their rated load capacity when inflated to the recommended inflation pressures. Refer to “Tire Load Limits And Inflation Pressure” at the end of this section.

Important

- The use of wheels and/or tires with higher load capacity ratings than originally equipped on the vehicle will not increase the Gross Axle Weight Rating (GAWR) or Gross Vehicle Weight Rating (GVWR) of the vehicle.

Correct tire pressures and driving techniques influence tire life. Underinflated tires can cause handling problems, poor fuel economy, shortened tire life, and tire overloading. Heavy cornering, excessively rapid acceleration, and unnecessary braking also increase tire wear.

## CHECKING WHEEL AND TIRE RUNOUT

Some vehicles are sensitive to tire and wheel assembly runout. Tires that are satisfactory on one vehicle might be unsatisfactory on another. When analyzing vibration problems, it is important to keep this in mind. In addition, different wheel positions on a vehicle may have different sensitivity levels. You should check for wheel runout or total wheel and tire runout in the following cases:

- If the tire and wheel vibration occurs below 40 miles per hour.
- If all wheels are balanced well within one ounce of static balance and five ounces of dynamic balance, and a vibration occurs.
- If there appears to be a bulge in a tire or an out-of-round condition as a tire rotates on a balancer.
- If any wheel damage is noticed.
- If there is a poor wheel fit on the hub and the vehicle exhibits vibration.
MEASURING WHEEL AND TIRE RUNOUT

Runout measurements of the wheel and tire assembly can be taken both on and off the vehicle. These measurements can be taken radially and laterally. A dial indicator equipped with a roller contact point, mounted on a heavy, solid base is the measurement device.

RADIAL RUNOUT

Radial runout is the egg-shaped difference from a perfect circle. Measure tire radial runout from the center tire tread rib although other tread ribs can be measured as well. The total runout is the reading from the gage, and the high spot is the location of the maximum runout. On a rim, if either flange is beyond specifications, replace the rim (figure 2).

LATERAL RUNOUT

Lateral runout is a sideways variation causing a twist or wobble and is measured on a side surface. On the tire and wheel assembly, measure the sidewall of the tire as close to the trend shoulder design edge as possible. The total runout is the reading from the gage, and the high spot is the location of the maximum runout. On a rim, if either flange is beyond guidelines, replace the rim (figure 3).

MEASUREMENT PROCEDURES

1. Inflat the tires to specifications.
2. Warm up the tires prior to taking measurements to eliminate flat spotting.
   - Newly installed tires usually do not require warming up.
3. Raise the vehicle on a lift.
   - If measurements will be taken off the vehicle, mount each tire and wheel assembly on a dynamic balance machine.
4. Mark the tire and wheel assemblies for exact replacement.
   - Mark a wheel hub bolt and its exact position on the wheel.

VECTORING

Vectoring is a technique used to reduce radial or lateral runout—and even dynamic balance on tire and wheel assemblies. Vectoring can be accomplished by positioning of the tire on the wheel and positioning of the tire and wheel assembly on the hub/rotor.

B. First Measurement (High Spot)
C. Valve Stem At 12 O'clock
D. Second Measurement (High Spot)
E. Tire Reference Mark At 6 O'clock

Figure 4—Checking Tire to Wheel Vectoring

Important
- Always rebalance the tire and wheel assembly after vectoring.

Tire To Wheel Vectoring
1. Determine which runout needs to be minimized.
   - Determine visually.
2. If radial runout is the problem, take a measurement on the center tread rib.
   - If the trend is uneven, wrap tape tightly around the tire, record the runout magnitude, and mark the high spot location (figure 4).
3. If lateral runout is the problem, take a measurement on the sidewall just below the edge of the tread shoulder.
   - Record the runout magnitude, and mark the high spot location.
4. Mark the tire sidewall at the valve location.
   - This is the 12 o'clock position.
   - The location of the high spot is always with respect to the clock location on the wheel.
5. Break the tire and wheel assembly down on a tire mounting machine and rotate the tire 6 hours (180°) on the rim (figure 4).
   - Reinflate the tire and measure the runout in question.
   - Record the magnitude and the location of the high spot. (Valve stem is 12 o'clock.)
6. If the clock location of the high spot remained at or near the clock location of the original high spot, the rim is the major contributor to the runout problem.
   - Confirm by removing the tire from the wheel and check the wheel rim runout.
   - If the wheel rim runout exceeds guidelines, replace the wheel.
7. If the clock position of the high spot is 6 hours from the original high spot, the tire is the major contributor to the runout problem (figure 5).
   - Replace the tire.
8. After correcting the tire to the wheel vectoring, rebalance the wheel and tire assembly.

Figure 5—Tire to Wheel Vectoring—Excessive Runout

Tire And Wheel Assembly To Hub/Rotor Vectoring
1. Mark the wheel hub bolt nearest the valve stem for reference (figure 6).
2. Rotate the assembly two wheel hub bolts and recheck the runout (figure 6).
   - Several positions may have to be tried to locate the optimum location.
   - This can be effective for both radial and lateral runouts.
3. If there is some looseness in the wheel hub bolt holes, radial runout can be reduced by loosening the hub bolt nuts slightly, moving the wheel position on the bolts and then retightening the nuts.
4. Balance the tire and wheel to hub/rotor assembly.
   - Compensates for any imbalance in the brake rotor, drum, or wheel cover.

EXCESSIVELY TIGHT WHEELS

Use this procedure to remove the wheel and tire assembly if it does not break free of the hub using a standard removal procedure.
1. Tighten all the lug nuts on the affected wheel.
   - Do not torque.
2. Raise the vehicle.
3. Loosen each nut two turns.
4. Lower the vehicle to the floor.
5. Rock the vehicle from side to side to loosen the wheel.
   Or rock the vehicle from forward to reverse allowing the vehicle to move several feet in each direction. Apply quick, hard jabs on the brake pedal to loosen the wheel.
6. Raise the vehicle and remove the lug nuts and the wheel.

**SEPARATING THE TIRE FROM THE WHEEL**

**NOTICE:** Use a tire changing machine to demount tires. Do not use hand tools or tire irons alone to remove the tire from the wheel. Damage to the tire beads or wheel rim could result.

- Follow the tire changing machine manufacturer's instructions to properly separate the tire from the wheel.

**MOUNTING THE TIRE ON THE WHEEL**

**BIAS PLY TIRES**

1. Clean the tire bead area.
2. Clean the rim bead seats with a wire brush or coarse steel wool to remove lubricants, old rubber, and light rust.
3. Apply an approved tire lubricant to the tire bead area.
4. Attach the tire to the wheel.
   - Use a tire changing machine. Follow the equipment manufacturer's instructions.

**CAUTION:** Do not stand over tire when inflating. The bead may break when it snaps over the safety hump, and cause serious personal injury. Do not exceed 275 kPa (40 psi) pressure when inflating. If 275 kPa (40 psi) pressure will not seat beads, deflate, re-lubricate and reinflate. Overinflation may cause the bead to break and result in personal injury.

5. Install a valve core and inflate to the specified pressure (figure 2).
   - The locating rings on each side of the tire must show above the rim flanges, positioned in direct relation to the wheel (not eccentric as compared with the rim).
6. Check the bead seating.
   - Tires must be mounted and inflated in accordance with the safety precautions included with the tire mounting equipment.

**RADIAL PLY TIRES**

**NOTICE:** Recommended vehicle tire mounting and inflation procedures are especially important with radial tires. Failure to follow these procedures can cause bead deformation in both tube type and tubeless tires due to incorrect bead seating. Bead deformation may lead to chafing, lower sidewall and bead area cracking, eccentric wear, ride vibration and nonretreadable castings.

**Tube Type Tires**

- Only use rims approved for radial tire usage by the rim manufacturer.
1. Clean the rim parts.
   - Remove all rust and other foreign material.
   - Make sure the rim parts match and are not sprung or broken.
2. Lubricate the tire beads, the portion of the tube between the beads, and the flaps with an approved rubber lubricant.
   - Radial tubes are identifiable by the letter “R” in the size designation. A red band in the valve stem and an “R” in the flap size designation also identify radial parts.

**NOTICE:** Do not use silicone base lubricants—this could cause the tire to slip on the wheel.

3. Inflate to operating pressure, deflate completely, and reinflate to operating pressure.
   - Allows the tube, flap, and tire to fit together properly.
4. Check the bead seating.
   - Visually check the slot and side ring gap (on two piece rims) to make sure the bead is seated.
5. Check the spacing between the rim flange and one of the three lower sidewall rim line rings while the tire is laying flat to verify bead seating.
   - Measurements must be taken each 90 degrees around the circumference of the rim flange.
   - If the spacing is uneven around the bead from side to side, repeat steps 1 through 3, then recheck.

**Installing Synthetic Tubes**

**NOTICE:** When the tube and the flap are not properly lubricated, and mounted, they will stretch thin in the tire bead and rim region. This will cause premature wear.

1. Clean the inside of the casing.
2. Insert the tube in the tire and inflate until it is nearly rounded out.
3. Inspect the rim for rust scale and bent flanges.
   - Clean rust scale and straighten the flanges where necessary.
4. Apply a solution of neutral vegetable oil soap to the inside and outside of the tire beads, and also the rim side of the tube.
   - Use a brush or a cloth swab.
   - Do not allow the soap solution to run down into the tire.
5. Follow the standard procedure when mounting the tube and tire on a drop center rim. Be sure the tire is centered on the rim so the beads are out of the rim well before inflating. Do not allow the tire to hang loosely on the wheel while inflating.
6. Center the valve and pull it firmly against the rim. Hold in this position and inflate until the tire beads are firmly seated on the rim against the flanges.
7. Remove the valve core to completely deflate the tire.
8. Reinflate the tire to the recommended pressure.
   - Refer to "Tire Load Limits And Inflation Pressure" at the end of this section.

Tubeless Tires

![Diagram of wheels and tire assembly](image)

**Important**
- Only use rims approved for radial tire usage by the rim manufacturer.
1. Clean the rim.
   - Remove all rust and other foreign material.
2. Lubricate tire beads and rim bead seats with an approved rubber lubricant.

**NOTICE:** Do not use silicone base lubricants—this could cause the tire to slip on the wheel.

3. Inflate the tire to operating pressure.
   - Due to the construction of radial truck tires, particularly in the lower sidewall and bead area, it may be difficult to get the tire to take air.
   - An inflation aid may be necessary to help seat the bead of tubeless radial tires. Two types of inflation aids are commercially available—metal rings which use compressed air to seat beads, and rubber rings which seal between the tire bead and rim bead seat allowing the bead to move out and seat. Lubrication is necessary with both aids.
4. Check the spacing between the rim flange and one of the three lower sidewall rim line rings while the tire is laying flat to verify bead seating.
   - Measurements must be taken each 90 degrees around the circumference of the rim flange.
   - If the spacing is uneven around the bead from side to side, repeat steps 1 through 3, then recheck.

**Important**
- This procedure must be followed to insure proper bead seating in order to prevent bead deformation.
- Radial tires, as well as bias tires, must be mounted and inflated in accordance with safety precautions noted in RMA Radial and Bias Truck Tire Service Manuals.

**INSTALLING THE TIRE AND WHEEL ASSEMBLY**

**CAUTION:** Before re-installing the wheels, remove any build up of corrosion on the wheel mounting surface and brake drum or disc mounting surface by scraping and wire brushing. Installing wheels with good metal-to-metal contact at the mounting surfaces can cause wheel nuts to loosen. This can lead to a wheel coming off while the vehicle is moving, possibly causing loss of control.

**SINGLE WHEELS**

![Diagram of single wheel installation](image)

**Install or Connect (Figure 7)**
1. Wheel and tire assembly in position on the hub/rotor, and lug nuts installed loosely.
2. Turn the wheel until one nut is at the top of the bolt circle. Tighten the nut just snug.
3. Snug up the remaining nuts criss-cross to minimize runout.
   - Nuts to "Specifications" at the end of this section.
   - Tighten evenly and alternately to avoid excessive runout (figure 7).

**DUAL WHEELS**

![Diagram of dual wheel installation](image)

**Install or Connect (Figure 7)**
1. Inner and outer wheel and clamp ring on the rear wheel, or wheel and clamp ring on the front wheel.
   - Be sure the pins on the clamp ring face outward.
2. Lub nuts finger tight.

**Tighten**
- Nuts to "Specifications" at the end of this section.
- For P30 models, tighten to 210 N·m (155 ft. lbs.), then tighten again to 237 N·m (175 ft. lbs.).
- Tighten evenly and alternately to avoid excessive runout (figure 7).
Figure 8—Underbody Swing Out Spare Tire Carrier (RPO P10)

**Measure**

- Lateral runout should not exceed 3.18 mm (0.125 inches) on the front wheel or 4.76 mm (0.187 inches) on the rear wheel.

**ALUMINUM WHEEL REFINISHING**

- Remove the tire and wheel assembly from the vehicle.
- Mark the position of the wheel weights on the tire for correct reinstallation after recoating the wheel. Remove the wheel weights and mask off the tire.

1. Remove the original clear coating.
   - Apply a chemical stripper such as 3M brand Troubleshooter to the wheel rim surface.
   - Wait 10 to 15 minutes, then wet scrub the surface using a 3M #98 Scotchbrite Cleaning Pad (3M part number 07445).
   - Rinse the surface thoroughly with clean water.

**CAUTION: Use of eye goggles is necessary to prevent personal injury.**

2. Remove surface oxidation.
   - Use 3M Superbuff Buffing Pad (3M part number 05701) and a medium type compound such as 3M part number 05955 or 05931.
   - Hose off the rim with water and scrub with a small brush to remove excess compound, then air blow dry.

3. Recoat the wheels.
   - Clean the surface of any contaminants using Prekleno.
   - Apply #801 Metal Conditioner, taking care to use rubber gloves and a clean cloth during the application. Keep the surface wet while applying.

**Important**

- Make sure #801 Metal Conditioner is reduced one part metal conditioner to three parts of water.
- Wipe off #801 Metal Conditioner carefully while the surface is still wet. Use a clean, dry cloth.

4. Apply the clear coat.
   - Apply R & M's 893 2K Clear with 894 Urethane Catalyst Hardener. Refer to the label for specific directions.
   - Wear proper respiratory protection such as a 3M Paint Respirator (part number 06984) or Easi-Air Respirator (part number 06986) or equivalent.

5. Allow the wheel to air dry overnight (minimum) before installing on the vehicle.

6. Attach balance weights and install the wheel and tire assembly on the vehicle.
   - Mount the weights in the marked positions and remove the masking from the tire.

**WHEEL AND TIRE BALANCING**

To insure successful, accurate balancing, the following precautions must be observed:

- The wheel and tire must be clean and free of all foreign matter.
- The tire should be in good condition and properly mounted using the balance mark on the tire, if any, or lined up with the inflation valve.
- Bent wheels that have a runout over 1.6 mm (1/16-inch) should be replaced.
- Inspect the wheel and tire assembly to determine if an out-of-round condition exists.

**Important**

- A severe out-of-round condition cannot be "balanced out." A wheel and tire assembly having an out-of-round condition exceeding 4.7 mm (3/16-inch) is not suitable for the front of the vehicle. Its use on the rear of the vehicle must be governed by its general condition and whether the roundness problem seriously detracts from overall ride quality.
- Follow the wheel balancer machine instructions while performing the balancing operation.

**OPTIONAL SPARE TIRE CARRIERS**

**UNDERBODY SWING OUT SPARE TIRE CARRIER (RPO P10)**

The underbody swing out spare tire carrier is standard equipment on RV 10/1500 series pickups. It is available as an option (RPO P10) on RV 20/2500 and 30/3500 series pickups (figure 8).
The underbody glide out spare tire carrier is available as an option (RPO P11) on all RV series pickups (figure 9).

The side panel mounted spare tire carrier is available as an option on all C-K series pickups (figure 10).

SECTION 4A

PROPELLER SHAFT

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of this manual as indicated at appropriate locations by the terminology "Notice: See ‘NOTICE’ on page 4A-1 of this section".

NOTICE: All propeller shaft to pinion flange fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of all parts.

DESCRIPTION

PROPELLER SHAFT

Torque is transmitted from the transmission to the rear axle through one or more propeller shafts and universal joint assemblies. The number of propeller shafts and universal joint assemblies vary with the vehicle wheel base, and the combination of transmission, transfer case (front drive) and rear axle equipment.

All propeller shafts are the balanced tubular type (figure 1). A splined slip joint is provided in some drivelines and others use a companion flange at the transmission end of the driveline. If two or more propeller shafts are used on a vehicle the slip joint is usually at the forward end of the rear propeller shaft.

Phasing

The propeller shaft is designed and built with the yoke lugs (ears) in line with each other (figure 1). This design produces the smoothest running shaft possible, and is called phasing.

Vibration can be caused by an out of phase propeller shaft. The propeller shaft will absorb vibrations from speeding up and slowing down each time the universal joint goes around. This vibration would be the same as a person snapping a rope and watching the "wave" reaction flow to the end. A propeller shaft working in phase would be similar to two persons snapping a rope at the same time, and watching the "waves" meet and cancel each other out. In comparison this would be the same as the universal joints on a propeller shaft. A total cancellation of vibration produces a smooth flow of power in the driveline. It is very important to reference mark the propeller shaft before removal, to assure phased installation alignment. Some propeller shafts have alignment marks or arrows stamped on the shaft at the time of production.

CENTER BEARING

Center bearings support the driveline when two or more propeller shafts are used. The center bearing is a ball type bearing mounted in a rubber cushion that is attached to a frame crossmember. The bearing is pre-lubricated and sealed by the manufacturer (figure 2).

UNIVERSAL JOINT

A universal joint is two Y-shaped yokes connected by a crossmember called a spider. The spider is shaped like a cross having arms of equal length called trunnions (figure 3).
Universal joints are designed to handle the effects of various loadings and rear axle windup during acceleration. Within the designed angle variations the universal joint will operate efficiently and safely. When the design angle is changed or exceeded the operational life of the joint may decrease.

The trunnion bearings used in universal joints are the needle roller type. The needle rollers are held in place on the trunnions by round bearing cups. The bearing cups are held in the yokes by either (depending on the manufacturer) snap rings or injected plastic.

When a driveline has a large or deep angle a constant velocity joint is used. Essentially, the constant velocity joint is made of two universal joints coupled by a yoke and phased for constant velocity. A centering ball socket between the joints keeps a relative position between the two joints. This centering device causes each of the two units to operate through one half of the complete angle between the propeller shaft and the differential carrier.
Figure 3—Simple Universal Joint

(figure 4). The ball socket on a constant velocity universal joint requires periodic lubrication through the fitting provided.

DIAGNOSIS OF DRIVELINE VIBRATION (ROAD TEST)

Four major component groups are usually the cause of or are related to vibration. When a technician is road testing a vehicle for vibration he must remember the four major component groups:

1. Engine and mounts.
2. Clutch and transmission.
3. Tires, wheels and brake drums.
4. Propeller shaft and universal joints.

Before road testing a vehicle, check the following:
1. In or out of phase propeller shaft.
2. All fasteners for tightness at universal joints, wheel lugs and engine mounts.
3. Tire air pressure.
4. Load conditions.

ROAD TEST
A technician should road test the vehicle to diagnose exactly what the complaint is. Record the speed and rpm at which the greatest vibration occurs. The vibration is likely to be in two places, in the steering wheel or in the seat bottom. The road test can be helpful in locating the vibration source either forward or aft.

COAST TEST
Drive the vehicle past the vibration speed, shift into neutral and coast back through the vibration speed. In this test two kinds of vibration normally occur; a shaking or a buzzing. A shaking vibration is usually tires or a wheel and brake drum/disc assembly problem. A buzzing vibration is usually a driveline problem.

</table>
| **Leak At The Front Slip Yoke (An Occasional Drop Of Lubricant Leaking From The Splined Yoke Is Normal And Requires No Attention)** | 1. Rough surface on splined yoke; burred, nicked or worn.  
2. Defective transmission rear oil seal. | 1. Replace the seal. Minor burrs can be smoothed by careful use of crocus cloth or fine stone honing. Replace the yoke if badly burred.  
2. Replace the transmission rear oil seal and replenish the transmission oil. |
| **Universal Joint Noise** | 1. Center bearing.  
2. Worn universal joint bearings.  
3. Improper lubrication.  
4. Loose flange bolts. | 1. Replace the center bearing.  
2. Replace.  
3. Lubricate as directed.  
4. Tighten to “Specifications” later in this section. |
| **Ping, Snap, Or Click In Drive Line (Usually Heard On Initial Load After The Transmission Is In Gear; Forward Or Reverse)** | 1. Loose bushing bolts on the rear springs or upper and lower control arms.  
2. Loose or out of phase companion flange. | 1. Tighten the bolts to specified torque.  
2. Remove companion flange, turn 180 degrees from its original position, lubricate the splines and install. Tighten the bolts and pinion nut to specified torque. |
| **Knocking Or Clunking Noise In The Driveline When Operating The Vehicle In A Floating Condition In High Or Neutral Gear At 10 MPH (16 km/h)** | 1. Worn or damaged universal joint.  
2. Side gear hub counterbore in the differential is worn oversize. | 1. Replace the worn or damaged universal joint.  
2. Replace the differential case and/or the sidegears. |
| **Roughness Or Vibration** | 1. Bent or dented propeller shaft.  
2. Undercoating on propeller shaft.  
3. Tire unbalance, 30-80 mph (48-129 km/h). Not throttle conscious.  
4. Tight universal joints.  
5. Worn universal joints.  
6. Burrs or gouges on companion flange. Check snap ring locating surfaces on flange yoke.  
7. Propeller shaft, parking brake drum or companion flange is unbalanced.  
8. Incorrect rear joint angle. The angle is usually too large when it is a factor.  
9. Excessive looseness at the slip spline.  
10. Distorted or damaged yokes or flanges.  
11. Yokes out of phase.  
12. Propeller shaft runout at 50 mph (80 km/h). Throttle conscious. | 1. Replace propeller shaft.  
2. Clean propeller shaft.  
3. Balance or replace as required.  
4. Impact yokes with a shaft hammer to free up. If unable to free up or if joint feels rough when rotated, replace.  
5. Replace.  
6. Rework or replace the companion flange.  
7. Check for a missing balance weight on the propeller shaft. Rotate the companion flange 180 degrees.  
8. Check and correct trim height at curb weight. Check and correct joint angle.  
9. Replace necessary parts.  
10. Install new yokes or flanges.  
11. Remove companion flange, turn 180 degrees from the original position, lubricate the splines and install. Tighten bolts to specified torque.  
12. Check propeller shaft runout at front and rear. Should be less than specified. If above, rotate propeller shaft 180 degrees and recheck. Replace the propeller shaft if runout is still over specification. |

#### ON-VEHICLE SERVICE

**PROPELLER SHAFT BALANCE CHECK**

- Raise the vehicle on a twin post hoist so the wheels can spin.

**Remove or Disconnect**

1. Tire and wheel assemblies and the brake drums.
   - **DO NOT APPLY THE BRAKE WITH THE DRUMS REMOVED.**

**Inspect**

- Propeller shaft, universal joints and attachments for mud, undercoating or loose fasteners.

**Clean**

- Propeller shaft, universal joints and attachments.

**Tighten**

- Any loose attachments or fasteners.

**Important**

- Run the vehicle in gear at the speed where the disturbance peaks; observe the intensity of the disturbance.
- Stop the engine.

2. Propeller shaft.

- Rotate the propeller shaft 180 degrees from the original position.

**Install or Connect**

1. Propeller shaft.
   - Determine the position which gives the best balance.
2. Rear drums, wheel and tire assemblies.
   - Determine the position which gives the best driveline response by road testing the vehicle for a final check of the propeller shaft balance.
   - Unacceptable balance, replace the propeller shaft.

**PROPELLER SHAFT RUNOUT CHECK**

Noise or vibration at high speed could be caused by a bent propeller shaft. The propeller shaft could have been damaged by rough handling or a collision. Check for propeller shaft straightness.

1. Raise the vehicle on a twin post hoist so the wheels can spin.
2. Attach a dial indicator having a magnetic base to a smooth place on the vehicle underbody.
3. Take dial indicator readings at the propeller shaft check points shown in figure 5. For runout specifications, refer to figure 6.
Important
- Do not attach the dial indicator base at a weld.

4. With the transmission in neutral, hand rotate the axle pinion flange or the transmission yoke and take the necessary dial indicator readings on the propeller shaft. Record the readings. Models having a two-piece driveline, measure the rear propeller shaft runout (figure 5). Reference mark the position of the rear propeller shaft yoke to the pinion flange, then remove the rear propeller shaft and measure the front propeller shaft runout on the tube and at the tapered hole on the splined shaft end (figure 5). If the runout exceeds specification, rotate the propeller shaft 180 degrees at the companion flange and install. Check the runout.

5. If the runout is still over specification at one or more check points, replace the propeller shaft after checking for vibration or noise. Check the runout on the replacement propeller shaft.

6. If the new propeller shaft runout is over specification, check for a bent companion flange.

Important
- The splined end of the front propeller shaft is critical to the smooth operation of a two-piece driveline. Be sure the dial indicator readings are accurate.

### Propeller Shaft Replacement (Rear Drive)

**Remove or Disconnect (Figure 2)**

- Raise the vehicle on a hoist.
- Skid plate if used.
- Reference mark the propeller shaft (4) to pinion flange (7) connection.

1. Skid plate if used.
2. Bolts (5).
3. Retainers (6).

Important
- Do not pound on the original propeller shaft yoke ears. The injection joints may fracture. Never pry or place any tool between a yoke and a universal joint.

4. Yoke and cross assembly (8).
- Tape bearing cups to prevent the loss of bearing rollers.

5. Propeller shaft (4).
- Slide the propeller shaft (4) forward.

3. Bolt (18) at the flange (17).
   - Mate the joint using reference marks.
   - Lubricate the Constant Velocity Joint (19). Refer to “Lubrication” later in this section.
4. Skid plate, if used.

Tighten
- All fasteners to specified torque. Refer to “Specifications” later in this section.

LUBRICATION

The front axle propeller shaft found on four-wheel drive vehicles requires a special lubricant at two locations: the constant velocity joint, and the slip yoke.

Constant Velocity Joint (C/V Joint)
The constant velocity (C/V) joint, located at the transfer case end of the front propeller shaft, must be lubricated periodically with a special lubricant, 1050679 or equivalent. If the lubrication fitting cannot be seen from beneath the vehicle refer to figure 9 which shows how the C/V joint may be lubricated from above, with a special adapter J-25512-2 on the end of a flex hose (figure 9).

Slip Spline
Apply chassis lubricant at the slip spline grease fitting until the grease begins to leave through the vent hole.

If the slip spline is dry or corroded, it may be necessary to disconnect the propeller shaft from the vehicle, remove the slip yoke, and wire brush the affected area. Wipe clean before installation.

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology: "NOTICE: See 'Notice' on page 4B-1 of this section."

**NOTICE:** All rear axle fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of all parts.

### DESCRIPTION

Light duty trucks use various rear axles. These axles can be identified by ring gear size in inches, by manufacturer (Corporate, Dana, or Rockwell) and by the type of axle shaft used (Semi-Floating or Full Floating). Corporate axles include the 8 1/2, 9 1/2 and 10 1/2-inch ring gear axles. Dana also supplies a 10 1/2-inch ring gear axle as well as a 9 3/4-inch ring gear axle. The 12-inch ring gear axle is supplied by Rockwell, and uses rear wheel disc brakes.

### REAR AXLE OPERATION

A basic differential has a set of four gears. Two are called differential side gears and the other two are differential pinion gears. Some differentials have more than two pinions. Each side gear is splined to an axle shaft, therefore each axle shaft must turn when its side gear rotates.

The differential pinion gears are mounted on a differential pinion shaft, and the gears are free to rotate on this shaft. The pinion shaft is fitted into a bore in the differential case and is at right angles to the axle shafts.

Power flow through the differential is as follows: the drive pinion rotates the ring gear. The ring gear, being bolted to the differential case, rotates the case. The differential pinion, as it rotates with the case, forces the pinion gears against the side gears. When both wheels have equal traction, the pinion gears do not rotate on the pinion shaft because the input force on the pinion gear is equally divided between the two side gears. Therefore, the pinion gears revolve with the pinion shaft, but do not...
rotate around the shaft itself. The side gears, being splined to the axle shafts and in mesh with the pinion gears, rotate the axle shafts.

If a vehicle were always driven in a straight line, the ring and pinion gears would be sufficient. The axle shaft could then be solidly attached to the ring gear and both driving wheels would turn at equal speed.

However, if it became necessary to turn a corner, the tires would scuff and slide because the outside wheel would travel further than the inside wheel. To prevent tire scuffing and sliding, the differential becomes effective and allows the axle shafts to rotate at different speeds.

When the vehicle turns a corner, the outer rear wheel must turn faster than the inner wheel. The inner wheel turns slower than the outer wheel and slows its rear axle side gear (as the axle shaft is splined to the side gear) and the rear axle pinion gears will roll around the slowed rear axle side gear, driving the other rear axle side gear and wheel faster.

LOCKING REAR AXLE

Eaton Locking Differential

The locking rear differential allows for normal differential function as indicated in the standard rear axle description. Additionally, the locking rear differential uses multi-disc clutch packs and a speed sensitive engagement mechanism that locks both wheels together if one wheel should spin excessively during slow vehicle operation.

DIAGNOSIS OF THE REAR AXLE

The most essential part of rear axle service, as with any mechanical repair, is proper diagnosis of the problem, and, in axle work one of the most difficult areas to diagnose is noise. Locating a broken axle shaft, or broken differential gear, presents little or no problem, but, locating and isolating axle noise can be an entirely different matter.

Degree of Noise

Any gear driven unit, especially an automotive drive axle where engine torque multiplication occurs at a 90 degree turn in the drive line, produces a certain amount of noise. Therefore, an interpretation must be made for each vehicle to determine whether the noise is normal or if a problem actually exists. A normal amount of noise must be expected and cannot be eliminated by conventional repairs or adjustment.

Acceptable noise can be defined as a slight noise heard only at a certain speed or under unusual or remote conditions. For example, this noise tends to reach a "peak" at speeds from 40 to 60 miles per hour (60 to 100 km/h) depending on road and load conditions, or on gear ratio and tire size. This slight noise is in no way indicative of trouble in the axle assembly.

Drive line noises may baffle even the best diagnostician. Vehicle noises coming from tires, transmission, propeller shaft, universal joints, and front or rear wheel bearings, are often mistaken for axle noise. Such practices as: raising tire pressure to eliminate tire noise (although this will not silence tread noise of mud and snow tires), listening for the noise at varying speeds and road surfaces, on drive, float, and coast conditions will aid in locating the source of alleged axle noises. Thus, every effort should be made to isolate the noise to a specific drive line component instead of making a random guess that could be a costly waste of time.

DETERMINING THE TYPE OF NOISE

External Noise

When a rear axle is suspected of being noisy, it is advisable to make a thorough test to determine whether the noise originates in the tires, road surface, front wheel bearings, engine, transmission, or rear axle assembly. Noise which originates in other places cannot be corrected by adjustment or replacement of parts in the rear axle assembly.

Road Noise—Some road surfaces, such as brick or rough-surfaced concrete, cause noise which may be mistaken for tire or rear axle noise. Driving on a different type of road, such as smooth asphalt or dirt, will quickly show whether the road surface is the cause of noise. Road noise usually is the same on drive or coast.

Tire Noise—Tire noise may easily be mistaken for rear axle noise, even though the noisy tires may be located on the front wheels. Tires worn unevenly, or having surfaces on non-skid divisions worn in saw-tooth fashion, are
usually noisy and may produce vibrations which seem to originate elsewhere in the vehicle. This is particularly true with low tire pressure.

**Tire Noise Test**—Tire noise changes with different road surfaces, but rear axle noise does not. Temporarily inflating all tires to 345 kilopascals (50 pounds per square inch) pressure, for test purposes only will materially alter noise caused by tires but will not affect noise caused by the rear axle. Rear axle noise usually stops when coasting at speeds under 30 miles per hour; however, tire noise continues but with lower tone as the vehicle speed is reduced. Rear axle noise usually changes when comparing “pull” and “coast” but tire noise remains about the same.

**Engine and Transmission Noises**—Sometimes a noise which seems to originate in the rear axle is actually caused by the engine or transmission. To determine which unit is actually causing the noise, observe approximate car speeds and conditions under which the noise is most pronounced; then stop the vehicle in a quiet place to avoid interfering noises. With the transmission in neutral, run the engine slowly up and down through the engine speeds corresponding to the vehicle speed at which the noise was most pronounced. If a similar noise is produced with the vehicle standing, it is caused by the engine or transmission and not the rear axle.

**Front Wheel Bearing Noise**—Loose or rough front wheel bearings will cause noise which may be confused with rear axle noise; however, front wheel bearing noise does not change when comparing “pull” and “coast.” Light application of the brake, while holding the vehicle speed steady, will often cause the wheel bearing noise to diminish, as this takes some weight off of the bearing. Front wheel bearings may be easily checked for noise by jacking up the wheels and spinning them, and also by shaking the wheels to determine if the bearings are excessively loose.

**Body Boom Noise or Vibration**—Objectional “body boom” noise or vibration at 55–65 mph (90–100 km/h) can be caused by an unbalanced propeller shaft. Excessive looseness at the spline can contribute to this unbalance.

Other items that may also contribute to the noise problem are as follows:

1. Undercoating or mud on the shaft, causing unbalance.
2. Shaft or companion flange balance weights missing.
3. Shaft damage, such as bending, dents, or nicks.
4. Tire-type roughness. Switch tires from a known good vehicle to determine a tire fault.

If, after making a comprehensive check of the vehicle, all indications point to the rear axle, further diagnostic steps are necessary to determine the axle components at fault. True rear axle noise generally falls into two categories: gear noise and bearing noise.

**Rear Axle Noises**

If a careful test of the vehicle shows that the noise is not caused by external items, it is then reasonable to assume that noise is caused by the rear axle assembly. Test the rear axle on a smooth level road to avoid road noise. It is not advisable to test the rear axle for noise by running with the rear wheels jacked up.

Noise in the rear axle assembly may be caused by a faulty propeller shaft, faulty rear wheel bearings, faulty differential or pinion shaft bearings, misalignment between two U-joints, or worn differential side gears and pinions; noise may also be caused by a mismatched, improperly adjusted, or scored, ring and pinion gear set.

**Rear Wheel Bearing Noise**—A rough rear wheel bearing produces a vibration or growl which continues with the vehicle coasting and the transmission in neutral. A brinelled rear wheel bearing causes a knock or click approximately every two revolutions of the rear wheel, since the bearing rollers do not travel at the same speed as the rear axle and wheel. With the rear wheels jacked up, spin the rear wheels by hand while listening at the hubs for evidence of a rough or brinelled wheel bearing.

**Differential Side Gear and Pinion Noise**—Differential side gears and pinions seldom cause noise since their movement is relatively slight on straight ahead driving. Noise produced by these gears will be most pronounced on turns.

**Pinion Bearing** failures can be distinguished because they rotate at higher speeds than differential side bearings and axle shaft bearings. Rough or brinelled pinion bearings produce a continuous low pitched whirring or scraping noise starting at a low speed.

**Side Bearings** produce a constant rough noise pitched lower than pinion bearing noise. Side bearing noise may also fluctuate in the above rear wheel bearing test.

**Gear Noise**

There are two basic types of gear noise. The first type is produced by broken, bent, or forcibly damaged gear teeth and is usually quite audible over the entire speed range and presents no particular problem in diagnosis. For example, hypoid gear tooth scoring generally results from the following: insufficient lubricant, improper break-in, improper lubricant, insufficient gear backlash, improper ring and pinion gear alignment, or loss of drive pinion nut torque. The scoring will progressively lead to complete erosion of the gear tooth, or gear tooth pitting and then eventual fracture if the initial scoring condition is not corrected (figure 1). Another cause of hypoid tooth fracture is extended overloading of the gear set which will produce fatigue fracture, or shock loading which will result in sudden failure.

---

**Figure 1—Causes of Gear Noise**

There are two basic types of gear noise: Gear Noise and Gear Breakage. Gear Noise includes scoring and pitting, while Gear Breakage includes fractures and tooth failures. The figure illustrates the various types of gear noise and their causes, such as insufficient lubricant, improper break-in, and improper ring and pinion gear alignment.
ABRASIVE ROLLER WEAR
Pattern on races and rollers caused by fine abrasives.
Clean all parts and housings, check seals and bearings and replace if leaking, rough or noisy.

ABRASIVE STEP WEAR
Pattern on roller ends caused by fine abrasives.
Clean all parts and housings, check seals and bearings and replace if leaking, rough or noisy.

GALLING
Metal smears on roller ends due to overheat, lubricant failure or overload.
Replace bearing, check seals and check for proper lubrication.

ETCHING
Bearing surfaces appear gray or grayish black in color with related etching away of material usually at roller spacing.
Replace bearings, check seals and check for proper lubrication.

Figure 2—Diagnosis of Tapered Roller Bearings
**BENT CAGE**
Cage damaged due to improper handling or tool usage.
Replace bearing.

**CAGE WEAR**
Wear around outside diameter of cage and roller pockets caused by abrasive material and inefficient lubrication.
Clean related parts and housings.
Check seals and replace bearings.

**BENT CAGE**
Cage damaged due to improper handling or tool usage.
Replace bearing.

**INDENTATIONS**
Surface depressions on race and rollers caused by hard particles of foreign material.
Clean all parts and housings. Check seals and replace bearings if rough or noisy.

Figure 3—Diagnosis of Tapered Roller Bearings
**FRETTAGE**
Corrosion set up by small relative movement of parts with no lubrication. 
Replace bearing. Clean related parts. Check seals and check for proper lubrication.

**SMEARS**
Smearing of metal due to slippage. Slippage can be caused by poor fits, lubrication, overheating, overloads or handling damage. Replace bearings, clean related parts and check for proper fit and lubrication.

**STAIN DISCOLORATION**
Discoloration can range from light brown to black caused by incorrect lubricant or moisture. Re-use bearings if stains can be removed by light polishing or if no evidence of overheating is observed. Check seals and related parts for damage.

**HEAT DISCOLORATION**
Heat discoloration can range from faint yellow to dark blue resulting from overload or incorrect lubricant. Excessive heat can cause softening of races or rollers. To check for loss of temper on races or rollers a simple file test may be made. A file drawn over a tempered part will grab and cut metal, whereas, a file drawn over a hard part will glide readily with no metal cutting. Replace bearings if over heating damage is indicated. Check seals and other parts.

*Figure 4—Diagnosis of Tapered Roller Bearings*
MISALIGNMENT
Outer race misalignment due to foreign object.
Clean related parts and replace bearing. Make sure races are properly seated.

CRACKED INNER RACE
Race cracked due to improper fit, cocking, or poor bearing seats.
Replace bearing and correct bearing seats.

FATIGUE SPALLING
Flaking of surface metal resulting from fatigue.
Replace bearing, clean all related parts.

BRINELLING
Surface indentations in raceway caused by rollers either under impact loading or vibration while the bearing is not rotating.
Replace bearing if rough or noisy.

Figure 5—Diagnosis of Tapered Roller Bearings
Differential pinion and side gears rarely give trouble. Common causes of differential failure are shock loading, extended overloading, and seizure of the differential pinions to the cross shaft resulting from excessive wheel spin and consequent lubrication breakdown. The second type of gear noise pertains to the mesh pattern of the gear teeth. This form of abnormal gear noise can be recognized because it produces a cycling pitch (whine) and will be very pronounced in the speed range at which it occurs, appearing under either “drive,” or “float” or “coast” conditions. “Drive” is acceleration or heavy pull. “Coast” is with a closed throttle and the vehicle in gear and “float” is using just enough throttle to keep the vehicle from driving the engine; the vehicle slows down gradually but the engine still pulls slightly. Gear noise tends to peak in a narrow speed range or ranges, and will tend to remain constant in pitch. Bearing noise will vary in pitch with vehicle speeds.

Refer to figures 2 through 5 for bearing diagnosis.

**ON-VEHICLE SERVICE**

**REAR AXLE ASSEMBLY REPLACEMENT (ALL AXLES)**

- Raise the vehicle on a hoist and support the axle assembly with a suitable lifting device.
- For 9¾-inch ring gear and 10½-inch ring gear axles, raise the vehicle and place jack stands under the frame side rails for support.
- Drain the lubricant from the axle housing.

**Remove or Disconnect**

1. Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
   - Tie the propeller shaft to a side rail or crossmember.
   - Tape the bearing cups to prevent loss of the rollers.
2. Wheel and brake drum or hub and drum assembly.
3. Parking brake cable from the lever and at the brake flange plate.
4. Hydraulic brake lines from the connectors.
5. Shock absorbers from the axle brackets.
6. Vent hose from the axle vent fitting if used.
7. Height sensing and brake proportional valve linkage if used.
8. Stabilizer shaft if used.
   - Support the assembly with a hydraulic floor jack.
10. U-bolts, spring plates and spacers from the axle assembly.
   - Lower the jack and the axle assembly.

**Install or Connect**

1. Axle assembly under the vehicle.
   - Align the axle assembly with the springs.
2. Spacers, spring plates and U-bolts to the axle assembly.
   - Raise the axle assembly.
3. Washers and nuts to the U-bolts.
   - Thread the nuts on firmly.
   - Adjust alignment of semi-float axles.
4. Stabilizer shaft if used.
5. Height sensing and brake proportional valve linkage if used.
6. Vent hose to the axle vent fitting if used.
7. Shock absorbers to the axle brackets.
8. Hydraulic brake lines to the connectors.
9. Parking brake cable to the lever and the flange plate.
10. Wheel and brake drum or hub and drum assembly.
11. Propeller shaft.

**NOTICE:** See “Notice” on page 4B1-1 of this section.

**Tighten**

- All fasteners to “Specifications” later in this section.

**Important**

- Check axle lubricant level at the filler plug hole. Lubricate as needed.
- Bleed the brake system, check operation and adjust if necessary. Refer to BRAKES (SEC. 5).
- Check axle and brake operation.
- Check for fluid leaks and road test the vehicle.

Figure 6—Axle Shaft and Housing Components

AXLE SHAFT, OIL SEAL AND BEARING REPLACEMENT
• Raise the vehicle on a hoist.
• Clean dirt from around the carrier cover.

Remove or Disconnect (Figure 6)

Tools Required:
J-2619-01 Slide Hammer with Adapter
J-23689 Axle Shaft Bearing Remover (large shaft)
J-29712 Axle Shaft Bearing Remover (9½-inch ring gear)

1. Wheel and tire assembly.
2. Brake drum.
3. Carrier cover (19).
   • Catch the oil in a drain pan.
   • Remove gasket material if used.
4. Screw (A) (figures 7 and 8).
5. Pinion shaft (B).
   • Remove the shaft from the case on vehicles without a locking differential.
   • With a locking differential remove the shaft (B) part way and rotate the case until the pinion shaft touches the housing (figure 9).
   • Use a screwdriver or similar tool to enter the case and rotate the lock until it aligns with the thrust block (figure 10).
   • Push the flange of the axle shaft towards the differential. Do not force or hammer the shaft to move the shaft.
   • Remove the lock from the button end of the axle shaft.
7. Axle shaft (12).
   • Slide the axle shaft out, being careful not to damage the seal.
8. Seal (14) using J-23689.
   • Use J-23689 for 8½-inch ring gear axle or J-29712 for 9½-inch ring gear to pull the bearing from the axle.
   • Insert the tool into the axle bore so that it grasps behind the bearing (15) (figure 12). Tighten the nut and washer against the face of the bearing (15).

Inspect
• All parts. Replace as necessary.

Install or Connect (Figures 6 and 10)

Tools Required:
J-8092 Driver Handle
J-21128 Axle Shaft and Pinion Oil Seal Installer
J-23690 Axle Shaft Bearing Installer

Figure 11—Pushing the Axle Shaft Inward

J-29709 Axle Shaft Bearing Installer (9 1/2-inch ring gear)
J-29713 Axle Shaft Seal Installer (9 1/2-inch ring gear)
- Lubricate the axle cavity between the seal (14) lips and the bearing (15) with wheel bearing lubricant. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).

1. Bearing (15).
   - Use J-23690 for the 8 1/2-inch ring gear axle and J-29709 for the 9 1/2-inch ring gear axle.
   - Bearing (15) into the axle (16) housing until the tool bottoms against the tube. Refer to figure 13.

2. Seal (14).
   - Use J-21128 for 8 1/2-inch ring gear axle and J-29713 for the 9 1/2-inch ring gear axle.
   - Drive the tool into the bore until the seal (14) bottoms flush with the end of the tube (figure 14).

3. Axle shaft (12).
   - Be careful not to damage the seal (14) when inserting the axle shaft (12).
4. Lock (13).
   — Without locking differential:
     • Place the lock on the button end of the axle shaft (12), then pull the shaft flange outward to seat the lock in the differential side gear.
   — With locking differential.
     • Keep the pinion shaft partially withdrawn (figure 9).
     • Place the lock in the position shown in figure 10. Pull the shaft flange outward to seat the lock in the differential side gear.
5. Pinion shaft (figure 8).
   • Align the hole in the pinion shaft with the screw hole in the differential case.
   • Tighten
     • Screw to 34 N·m (25 ft. lbs.).
7. Carrier cover gasket or RTV (if used).
8. Carrier cover (19).
9. Bolts (18) and clip (17).
   • Tighten bolts (18) in a crosswise pattern.
11. Wheel and tire assembly.
   • Lower the vehicle.
12. Axle lubricant. Fill to the filler plug hole level. Refer to MAINTENANCE AND LUBRICATION (SEC. OB).

**BRAKE BACKING PLATE REPLACEMENT**

- Raise the vehicle on a hoist.

**Remove or Disconnect**
1. Wheel, tire and brake drum.
2. Axle shaft. Refer to "Axle Shaft Replacement" earlier in this section.
3. Brake line from the cylinder inlet.
4. Brake components from the backing plate. Refer to BRAKES (SEC. 5).
5. Bolts and washers from the axle.

**Install or Connect**
1. Backing plate to the axle.
2. Bolts and washers to the plate.
3. Brake components to the backing plate. Refer to BRAKES (SEC. 5).
4. Brake line to the cylinder inlet.
   • Refer to BRAKES (SEC. 5) for bleeding and adjustment procedure.
5. Axle shaft. Refer to "Axle Shaft Replacement" earlier in this section.
6. Wheel, tire and brake drum.

**WHEEL STUD REPLACEMENT**

- Raise the vehicle on a hoist and allow the axle to hang free.

**Remove or Disconnect**
Tool Required:
J-6627-A Wheel Stud Remover
1. Wheel, tire and brake drum.
2. Stud from the axle flange using J-6627-A (figure 15).

**Install or Connect**
1. Stud in the axle flange hole. Refer to figure 15.
   • Start the new stud into the axle flange hole by pressing firmly with your hand.
   • Thread on a lug nut with the flat side to the vehicle.
   • Tighten the lug nut and draw the stud head into the rear of the flange.
   • Thread the lug nut off.
2. Wheel, tire and brake drum.
   • Lower the vehicle.
PINION FLANGE, DUST DEFLECTOR/OIL SEAL REPLACEMENT

- Raise the vehicle on a hoist.

**Remove or Disconnect**

Tool Required:

J-8614-01 Companion Flange Holder and Remover

1. Propeller shaft from the axle.
   - Tie the propeller shaft to a frame rail or crossmember.

**Measure**

- The torque required to rotate the pinion (figure 16). Record the torque value for later reference.

**Important**

- Scribe a line on the pinion stem, pinion nut and the companion flange and record the number of exposed threads on the pinion stem. Use the scribed reference and the exposed threads as a reinstallation guide (figure 17).

   - Position J-8614-01 on the flange so that the four notches on the tool face the flange (figure 18).

3. Flange using J-8614-01
   - Use the special nut and forcing screw to remove the flange (figure 19).

4. Oil seal. Use a screw driver to pry the seal out of the bore.

**Inspect**

- The pinion flange for a smooth oil seal surface, for worn drive splines, damaged ears and for smoothness of the bearing contact surface. Replace if necessary.

5. Dust deflector.

---

**Figure 15—Pressing Out A Wheel Stud**

**Figure 16—Measuring Pinion Rotating Torque**

**Figure 17—Scribed Marks**

**Figure 18—Removing the Drive Pinion Nut**

---
**Install or Connect**

**Tools Required:**
- J-8614-01 Companion Flange Holder and Remover
- J-22388 Pinion Oil Seal Installer (9\(\frac{1}{2}\)-inch ring gear)
- J-22804-1 Pinion Oil Seal Spacer
- J-22836 Pinion Seal Installer (8\(\frac{1}{2}\)-inch ring gear)

1. Dust deflector on the flange.
   - Stake new deflector at three new equally spaced positions. Staking must be such that the seal operating surface is not damaged.

2. Oil seal.
   - Pack the cavity between the lips of the oil seal with extreme pressure lithium-base lubricant.
   - Position the oil seal in the bore then place J-22804-1 over the oil seal and flat against the seal flange (figure 20).
   - Use J-22836 for the 8\(\frac{1}{2}\)-inch ring gear or J-2288 for the 9\(\frac{1}{2}\)-inch ring gear to press the oil seal into the bore (figure 20).
   - Turn J-22804-1 from installed position 180 degrees to assure proper installation against the pinion flange.
   - Pack the cavity between the end of the pinion splines and the pinion flange with a non-hardening sealer such as PERMATEX TYPE A or equivalent.

3. Flange onto the pinion using J-8614-01.
   - Place washer and nut on the pinion threads and tighten the nut to the original scribed position using the scribe marks and exposed threads as a reference (figure 21). **DO NOT ATTEMPT TO HAMMER THE FLANGE ONTO THE PINION SHAFT.**

4. Propeller shaft.
   - Lower the vehicle and road test.

**Figure 19—Removing the Drive Pinion Flange**

- Tap the deflector from the flange if replacement is necessary.
- Clean up the stake points on the flange.
- Clean all foreign material from the contact area.

**Figure 20—Installing the Pinion Seal**

- **Measure**
  - The rotating torque of the pinion and compare with the torque recorded earlier (figure 16).

- **Tighten**
  - The pinion nut in additional small increments until the torque necessary to rotate the pinion exceeds the original recorded value by 0.35 N•m (3 in. lbs.).
FULL FLOATING AXLE
(9 3/4- AND 10 1/2-INCH RING GEAR)

AXLE SHAFT REPLACEMENT

Remove or Disconnect (Figures 22 and 23)
1. Bolts (55).
   • Rap the axle shaft (53) flange lightly with a soft faced hammer to loosen the shaft.
   • Grip the rib on the axle shaft (53) flange with a locking plier and twist, to start shaft removal.
2. Axle shaft (53) from the tube.

Clean
• Axle shaft (53) flange. Remove old RTV or gasket (51).
• Outside face of the hub assembly.

Inspect
• All parts and replace as necessary.

Install or Connect (Figure 23)
1. Axle shaft (53) with a gasket or RTV applied.
   • Be sure the shaft splines mesh into the differential side gear.
   • Align the axle shaft holes with the hub holes.
2. Bolts (55) figures 22 and 23.

Tighten
• Bolts (35) to specified torque later in this section.

HUB AND DRUM ASSEMBLY REPLACEMENT

Remove or Disconnect (Figure 23)
• Raise the vehicle until the wheel is free to rotate.
  Tool Required:
  J-2222-C Wheel Bearing Nut Wrench
1. Wheel and tire.
2. Axle shaft (52) as outlined earlier in this section.
3. Nut (40) use J-2222-C or retaining ring (56). Refer to figure 24.
4. Lock (41) or key (57).
5. Adjusting nut (42, 58). Refer to figure 24.
6. Washer (43).

Inspect
• All parts and replace as necessary.

Install or Connect (Figure 23)

NOTICE: For steps 3, 4 and 5 see “Notice” on page 4B-1 of this section.
  Tool Required:
  J-2222-C Wheel Bearing Nut Wrench
1. Hub and drum (48, 49) to the tube.
   • Be sure the bearings and the oil seal are positioned properly.
   • Apply a light coat of high melting point EP bearing lubricant to the contact surfaces and the outside of the axle tube.
2. Washer (43). Tang into key way.
3. Adjusting nut (42, 58). Refer to figure 24.
4. Lock (41) or key (57).
   • Bend the tang to the flat of the adjusting nut (42) or insert the key (57).
5. Nut (40) or retaining ring (56). Refer to figure 24.
6. Axle shaft (52) earlier in this section.
7. Wheel and tire.
   • Lower the vehicle.
WHEEL BEARING/CUP REPLACEMENT

- Remove or Disconnect (Figure 23)
  - Raise the vehicle till the wheels are free to rotate.
  - Tools Required:
    J-8092 Driver Handle
    J-24426 Outer Wheel Bearing Cup Installer
  1. Axle shaft (52) as outlined earlier in this section.
  2. Hub and drum (48, 49) as outlined earlier in this section.
  3. Oil seal (47) or (62).
  4. Inner bearing (46) or (61). Use a drift to remove the bearing and cup.
  5. Retaining ring (45) or (60).
    - Use snap ring pliers to remove the ring.
  6. Outer bearing (44) or (59) using J-8092 with J-24426 (figure 25).
    - Drive the bearing (44, 59) and cup from the hub (49).
Clean
- Old sealing compound from the oil seal (47, 62) bore in the hub (49).
- Bearing assemblies in a solvent using a stiff brush to remove the old lubricant. Do not spin them.
- Lubricant from the axle housing and inside the hub (49).
- Gasket material from the hub (49), axle shaft (52).

Inspect
- Bearings for wear, chipped edges or other damage. Check for flat or rough spots on the rollers.
- Cups for pits and cracks.
- Oil seal for wear or roughness. Replace parts as necessary.

Install or Connect (Figure 23)

Tools Required:
- J-8092 Driver Handle
- J-8608 Pinion Bearing Cup Installer
- J-24426 Outer Wheel Bearing Cup Installer
- J-24427 Inner Wheel Bearing Cup Installer
- J-24428 Axle Shaft Seal Installer

1. Outer bearing cup (44, 59) into the hub (49).
   - Drive the cup into the hub using J-8092 and J-8608. Be sure J-8608 is installed upside down on J-8092 so that the chamfer does not contact the bearing cup. Drive the cup beyond the retaining ring groove.

2. Retaining ring into the groove.
   - Drive the cup back onto the retaining ring using J-24426.

3. Inner bearing cup using J-8092 and J-24427.
   - Drive the cup into place until it is seated against the hub shoulder.

4. Inner bearing (46) or (61).

6. Hub and drum assembly.

7. Outer bearing (44) or (59).

Adjust
- Bearing preload. Refer to "Bearing Adjustment."

8. Axle shaft (52).

NON-DEMOUNTABLE TYPE DRUM REPLACEMENT
- Construction of the non-demountable type drum and hub assembly is such that replacement cannot be done with the hub assembly installed on the vehicle.

Remove or Disconnect
- Raise the vehicle.
1. Hub and drum assembly. Refer to “Hub and Drum Assembly Replacement” earlier in this section.
2. Retaining bolts, stud nuts or wheel studs.
   - Separate the drum, hub and oil deflector.

Figure 26—Wheel Bolt Replacement
- Press the wheel studs out of the drum. Replace parts as necessary.

Install or Connect
1. Drum to the hub.
   - Make certain drain holes are in alignment.
2. Oil deflector to the drum.
   - Apply a light coating of sealing compound to the oil deflector contact surface.
3. Retaining bolts, stud nuts or wheel studs.
   - Press the wheel studs into the drum.

WHEEL BOLT REPLACEMENT
- Wheel bolts are serrated and may also be swaged in place; however, replacement procedure remains the same for both types of installation. Press the wheel bolts out of the hub flange, then press new wheel bolts into place, making sure of a tight fit. When replacing all of the wheel bolts be sure that the hub oil deflector is in position under the wheel bolt heads. Refer to figure 26.

BEARING ADJUSTMENT
- Make sure the brakes are fully released and do not drag.
- Check the wheel bearing play by grasping the tire at the top and pulling and pushing back and forth, or by using a pry bar under the tire. If the wheel bearings are properly adjusted, movement of the brake drum in relation to the brake flange plate will be barely noticeable and the wheel will turn freely. If the movement is excessive, adjust the bearings.

Remove or Disconnect (Figure 23)
Tool Required:
- J-2222-C Wheel Bearing Nut Wrench
- Raise the vehicle until the wheel is free to spin.
1. Axle shaft (52). Refer to “Axle Shaft Replacement” earlier in this section.
• Be sure the keyway, threads and adjusting nut (42, 58) are clean and free of chips, burrs and shavings.

2. Nut (40) or retaining ring (56).
   • Disengage the tang from the nut (40).

3. Lock (41) or key (57).

Tighten
• Adjusting nut (42, 58) to 70 N·m (50 ft. lbs.) using J-2222-C (figures 27 and 28).
• Be sure the bearings are seated and in contact with the spindle shoulder.

Adjust
• Nut (42, 58). Back the nut (42, 58) off until just loose, but not more than one slot of the lock or the axle spindle using J-2222-C. Align the adjusting nut (58) slot with the keyway in the axle spindle.

Install or Connect (Figure 23).
1. Key (57) if used or new lock (41).
   • Key (57) into the keyway and adjusting nut (58) slot.
   • Bend the lock (41) tang to the flat of the adjusting nut (42).
2. Retaining ring (56) or nut (40) if used.
   • Bend the lock (41) tang to the flat of the nut (40).
   • Be sure the retaining ring (56) is seated.
3. Axle shaft (52). Refer to "Axle Shaft Replacement" earlier in this section.

PINION OIL SEAL/COMPANION FLANGE REPLACEMENT
• The pinion oil seal and the companion flange may be replaced with the carrier assembly installed in the vehicle.

Remove or Disconnect
Tools Required:
J-8614-01 Companion Flange Holder and Remover
• Raise the vehicle.
1. Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
   • Tie the propeller shaft to a frame rail or crossmember.

Important
• Scribe a line on the pinion stem, pinion nut and companion flange to be used as a guide for reinstallation (figure 17).

   • Use the special nut and forcing screw to remove the flange (figure 19).
4. Oil seal.
   • Pry the oil seal from the bore. Do not damage the machined surfaces. Thoroughly clean foreign material from the contact area.
   • Replace parts as necessary.

Install or Connect
Tools Required:
J-8614-01 Companion Flange Holder and Remover
J-24384 Pinion Oil Seal Installer (Dana 10½-inch ring gear axle).
J-24434 Pinion Oil Seal Installer (Chevrolet 10½-inch ring gear axle).
1. Oil seal into the bore using J-24384 or J-24434.
   • Lubricate the cavity between the new seal lips with a high melting point bearing lubricant.
2. Flange using J-8614-01.
   • Use scribed marks for reinstallation.
   • Use scribe mark as an installation reference.
4. Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
AXLE VENT REPLACEMENT

- A threaded type axle vent is used on the Rockwell 12-inch ring gear axle and must be replaced if the vent cap is damaged or missing.

Clean
The area around the axle vent.

Remove or Disconnect
Axle vent from the housing.

Install or Connect
Axle vent to the housing.

AXLE SHAFT REPLACEMENT

- Raise the vehicle and place jack stands under the frame side rails.

Remove or Disconnect (Figure 29)
Tools Required:
J-2619-01 Slide Hammer
1. Bolts (70) and washers (71).
2. Hub cap (72).
3. Axle shaft (74) using J-2619-01.

Install or Connect (Figure 29)
Tools Required:
J-2619-01 Slide Hammer
1. Axle shaft (74).
   - Tap the axle shaft (74) into position using J-2619-01.
   - Index the axle shaft (74) splines into the hub (86) splines.
2. Gasket (73).
3. Hub cap (72).
4. Washers (71) and bolts (70).

BEARING ADJUSTMENT

- Make sure the brakes are fully released and do not drag.
- Check the wheel bearing play by grasping the tire at the top and pulling and pushing back and forth, or by using a pry bar under the tire. If the wheel bearings are properly adjusted, movement of the hub or disc will be barely noticeable. If the movement is excessive, adjust the bearings.
Remove or Disconnect (Figure 29)

Tool Required:
- J-25510 Wheel Bearing Nut Wrench

1. Axle shaft (74). Refer to "Axle Shaft Replacement."
3. Lock washer (89).

Adjust

- Nut (88) using J-25510. Tighten the nut (88) while the hub is rotating to 68 N·m (50 ft. lbs.). Make sure the bearing surfaces are in contact and then back the nut (88) off 1/8 turn.

Install or Connect (Figure 29)

1. Lock washer (89).
3. Axle shaft (74). Refer to "Axle Shaft Replacement."

DRIVE PINION OIL SEAL REPLACEMENT

Remove or Disconnect (Figure 30)

Tools Required:
- J-8614-01 Companion Flange Holder and Remover

1. Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
2. Cotter key (91) and nut (92) using J-8614-01.
3. Companion flange (94).
4. Bolts (97).
5. Oil seal retainer (95).
6. Oil seal (96).

Install or Connect (Figure 30)

1. Oil seal (96) into the bore using a suitable tool.
   - Be sure the seal (96) bottoms against the bore shoulder.
2. Oil seal retainer (95).
3. Bolts to the retainer (97).

SECTION 4C
FRONT AXLE

The following “Notice” applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology: “NOTICE: See ‘Notice’ on page 4C-1 of this section.”

NOTICE: All front axle fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of all parts.

DESCRIPTION

The front axle is a hypoid gear axle unit equipped with steering knuckles and an automatic or manual locking hub. The V-10/15 and 20/25 models use a Chevrolet front axle having an 8½-inch ring gear axle rated at 3600 pounds for the V-10/15 and 3800 pounds for the V-20/25. A Dana (60 Series) axle is used on the V-30/35 model and is rated at 4500 pound capacity. The Dana axle has a 9¾-inch ring gear. Automatic hub locks are used on all models to engage the hub whenever four-wheel drive is selected. A manual locking hub is used on the V-30/35 model only and must be engaged manually whenever four-wheel drive is selected.
DIAGNOSIS OF THE FRONT AXLE

ROAD TEST
- Check tires for irregular wear.
- Check tire pressure.
- Check axle lubricant level.
- Drive to warm up the front axle.
- Test at various speeds in drive, float, coast and while cornering.
- Verify that the hubs are locked.

TIRE NOISES
- Change the tire pressure to minimize noises.
- Drive over different road surfaces.
- Smooth black-top minimizes tire noise.
- Cross switch the tires, if necessary.
- Snow tire treads and studs cause added noises.

ENGINE OR EXHAUST NOISES
- Drive slightly above the speed where the noise occurs, place transmission in neutral.
- Let the engine speed drop to idle.
- Stop the vehicle.
- Run the engine at various speeds.

TEST FOR WHEEL BEARING NOISE
- Drive the vehicle at low speed on a smooth road.
- Turn the vehicle to develop left and right motions, traffic permitting.
- Noise should change due to cornering loads.
- Jack-up wheels to verify roughness at the wheels.

*TEST FOR DIFFERENTIAL BEARING NOISE
- Drive the vehicle at low speed on a smooth road.
- Constant low pitch bearing noise may be heard.
- Noise should not change in reversing turns.
- The noise pattern should vary with the wheel speed.

*TEST FOR PINION BEARING NOISE
- Rough running or a whine noise should increase with speed.
- Noise pitch should be higher than differential noise.
- Perform the test on a smooth road to minimize tire noises.
- Perform test at various speeds in drive, float, and coast.
- Rear pinion bearing noise may be louder on acceleration.
- Front pinion bearing noise may be louder on deceleration.
- Gear noise tends to peak in a narrow speed range.
- Bearing tests should be done in 2H (after 4H selection to lock hubs). This removes the transfer case whine.

ON-VEHICLE SERVICE

AXLE SHAFT REPLACEMENT
Remove or Disconnect (Figure 1)
- Raise the vehicle.
1. Wheel and tire.
2. Brake caliper (40).
3. Hub lock mechanism (20).
4. Rotor and hub (28).
5. Inner bearing (31) and seal (32).
6. Splash shield (41), brake bracket (39) and spindle (38).
7. Axle shaft (46).
- Lube the spindle bearing (37) and spindle (38).
- Pack the inner and outer wheel bearing (31, 26).

Install or Connect (Figure 1)
1. Seal (36) and spacer (35) to the axle shaft (46).
2. Axle shaft (46) into the housing (42).
3. Spindle (38) to the knuckle (44). Be sure the seal (34) and outer deflector (33) are in place.
5. Splash shield (41).
- New washers (48) and nuts (49) to the studs. Torque the nuts (49) to 88 N·m (65 ft. lbs.).
6. Hub and disc (28).
- Adjust the wheel bearings (26, 31). Refer to FRONT SUSPENSION (SEC. 3C).
7. Retainer (22) and ring (21).
8. Hub lock mechanism (20).
NOTICE: See "Notice" on page 4C – 1 of this section.

   - Do not stretch or damage the brake hose.
10. Wheel and tire.
   - Lower the vehicle and test.

FRONT AXLE ASSEMBLY REPLACEMENT

Remove or Disconnect (Figure 1)
- Raise the vehicle until the weight is removed from the front springs. Support the vehicle with jack stands placed behind the front springs.
1. Propeller shaft. Refer to "Propeller Shaft" (Sec. 4A).
2. Connecting rod from the steering arm. Refer to FRONT SUSPENSION (SEC. 3C).
3. Brake caliper (40).

- Support the brake caliper (40) so as not to stretch or damage the brake hose.
4. Shock absorbers from the axle brackets.
5. Front stabilizer bar.
6. Axle vent tube and clips (figure 2).
   - Support the axle with a jack.
8. Axle assembly out from under the vehicle.

Clean
- Axle assembly.

Inspect
- The assembly and repair or replace as necessary.

NOTICE: For steps 1, 5, 6 and 7, see "Notice" on page 4C – 1 of this section.

Install or Connect (Figure 1)
- Axle assembly positioned under the vehicle.
1. Plates, spacers, U-bolts, washers and nuts.
Install or Connect

- Lubricate the new bearings with a high melting point type wheel bearing grease.
- Bearing in a yoke ear.
- Trunnion in the bearing.
- Another bearing in the opposite yoke ear with the trunnion aligned.
- Bearing in each ear of the companion yoke.
  - Press the bearings in beyond the lock ring grooves.
- Lock ring at each bearing.
  - Tap the yoke lightly to seat the bearings against the lock rings.

LOCKING HUB COMPONENT REPLACEMENT

AUTOMATIC HUB COMPONENT REPLACEMENT

Remove or Disconnect (Figure 3)

1. Screws (50) and O-ring seals (52).
2. Cover (52).
3. Seal (53).
4. Keeper (60).
5. Spring (54).
6. Inner race (55).
7. Bearing (56).
8. Retainer (58).
9. Ring (77) from the sleeve (67) groove.
  - Pull the remaining components from the wheel.
10. Retaining ring (73) from the groove in the clutch gear (59).
  - Rotate the drag sleeve (75) until it drops into engagement with the gear (59).
  - Lift and cock the drag sleeve (75) to unlock the tongs of the brake band (74) from the "window" of the inner cage (72), then move the drag sleeve (75) and brake assembly away.

Important

- NEVER REMOVE THE BRAKE BAND (74) FROM THE DRAG SLEEVE (75). The spring tension of the brake band (74) can be changed if the coils are over expanded and the operation of the hub could be affected.
- While removing the inner cage (72) use a small screw driver to pry the plastic outer cage (71) away.
13. Outer cage (71).
  - Pry the plastic outer cage (71) tabs free from the groove in the clutch gear (59) and move the outer cage (71) away.
14. Sleeve (67) from the clutch gear (59).
  - Compress the return spring (64) and hold the assembly in a compressed condition by using the clamps shown in figure 4.
  - Position the assembly with the clamps in place in a vice and hold both ends of the sleeve (67).
Figure 3—Automatic Hub Components, V10/15, V20/25 and V30/35
15. Ring (61). While holding the sleeve (67) in the vise, remove the clamps holding the return spring (64) and then open the vise and release the return spring (64).

17. Retainer (63).
18. Stop ring (68). Align the ends of the stop ring (68) with the legs of the cam (70) to allow removal.
19. Spring (69).
20. Cam (70) from the gear (66).

Inspect
- All parts and replace as necessary.

Install or Connect (Figure 3)
1. Cam (70) over the flats of the gear (66).
2. Spring (69). Compress the spring (69) and slide the large diameter end against the gear (66).
3. Gear (66) over the splines of the sleeve (67). Cam (70) should locate at the end of the sleeve (67) having no splines.

Important
- The gear (66) and spring (69) should slide freely over the splines of the sleeve (67).
4. Stop ring (68) to the groove of the sleeve (67).
5. Retainers (63 and 65) to each end of the spring (64). Retainer (65) to the shoulder of the gear (66).
6. Retainer plate (62) to the retainer (63).

- Compress the return spring (64) and hold the assembly together with clamps (figure 4).
7. Ring (61) in the groove of the sleeve (67).
- Place the assembly (steps 1 through 7) into the clutch gear (59) and support the clutch gear (59) above a flat surface allowing the assembly to drop down so that the tangs of the brake band (74) may be assembled later.
8. Outer cage (71) into the clutch gear (59). The ramps of the outer cage (71) must face the cam (70).
- Locate the outside tabs of the outer cage (71) into the wide grooves of the clutch gear (59).
9. Inner cage (72) into the outer cage (71). Align the tab of the outer cage (71) with the “window” of the inner cage (72).
10. Ring (73). Into the groove of the clutch gear (59) above the outer cage (71).

Important
- Service the brake band (74) and drag sleeve (75) as an assembly and be sure the original lubricant has not been removed or contaminated. Lubricant number 1052750 or its equivalent must be used in this assembly.
11. Brake band (74) tangs. Place the tangs of the brake band (74) on each side of the lug of the outer cage (71) located in the “window” of the steel inner cage (72). Cock these parts to engage the tangs in this position.
12. Spacer (76) and retaining ring (77). To the sleeve (67) above the drag sleeve (75).
13. Hub assembly to the vehicle.
14. Ring (57) to the clutch gear (59) unsplined end. Locate the tangs of the ring (57) pointing away from the vehicle.
15. Keeper (60). Hold the tangs of the ring (57) together and attach the keeper (60). For K10 and K20 assemble the O-ring seal (53) in the clutch gear (59) groove and over the keeper (60).
16. Bearing (56) over the inner race (55). Lubricate the bearing (56) with light wheel bearing grease. Steel balls should be visible when bearing (56) is properly installed.
17. Retainer (58) into the outer race (55) hole. Bearing (56) inner race (55) and retainer (58) into the sleeve (67).
18. Spring (54) into the cover (52) bore. Align cover (52) screw holes with the screw thread holes in the clutch gear (59).
19. O-ring seals (51) and screws (50) in the cover (52). The hub sleeve (67) and attached parts should turn freely after assembly.

Tighten
- Screws (50) to 5.1 N m (45 in. lbs.).

Important
- The five cover screws (50) must be loosened (three or four turns) and then pushed inward to
Figure 5—Manual Hub Components, V30/35

allow the retaining ring (57) to expand when assembling the automatic locking hub to the vehicle.

**AUTOMATIC HUB TO THE WHEEL ADJUSTMENT**

A lock ring (80) is supplied with each new automatic hub assembly. Assemble this lock ring (80) between the nut with pin (81) and the adjusting nut (79) as follows:

Use J-6893 to torque the nut with pin (81) to 68 N·m (50 ft. lbs.) to seat the wheel bearings; then back off the nut with pin (81) and torque to 47 N·m (35 ft. lbs.) while rotating the hub (figure 3).

Then back the nut with pin (81) off a maximum of 3/8 turn. Assemble the lock ring (80) over the axle shaft against the nut with pin (81) so that the inner tang enters the axle shaft keyway. One of the holes in the lock ring (80) must engage the pin on nut (81). Thread the adjusting nut (79) onto the axle shaft and tighten to 247 N·m (183 ft. lbs.).

Align the cut-outs on the drag sleeve (75) with the tabs on the lock ring (80) as the splines of the clutch gear (59) mesh with the splines of the wheel hub. Loosen the five cover screws (50) three or four turns and push in on the screws (50) to allow the ring (57) to expand into the groove in the wheel hub. Torque the screws (50) to 5.1 N·m (45 inch lbs.).

**MANUAL LOCKING HUB REPLACEMENT**

1. Screws (91).
2. Outer hub locking assembly (92, 93, 94, 95, 96, 97, 98, and 99).
3. Snap ring (90) from the axle shaft end.
4. Internal snap ring (85) from hub.
5. Body assembly (86, 87, 88 and 89).

**Inspect**

- All parts and replace as necessary.
**4C-8 FRONT AXLE**

Install or Connect (Figure 5)
1. Body assembly (86, 87, 88, and 89).
2. Internal snap ring (85) to the hub.
3. Snap ring (90) onto the axle shaft end.
4. Outer hub locking assembly (92, 93, 94, 95, 96, 97, 98, and 99).
5. Screws (91).

Outer hub locking assembly (92, 93, 94, 95, 96, 97, 98, and 99).
Screws (91).

MANUAL LOCKING HUB REBUILD PROCEDURE

- Outer hublock knob assembly should be replaced only as a unit, because timing relationships are difficult to restore if disassembly occurs. The inner body may be disassembled for cleaning and component replacement.

Remove or Disconnect (Figure 5)
1. Screws (91).
2. Hub body (86).

Inspect
- All parts and replace as necessary.

Install or Connect (Figure 5)
- Lubricate inner body parts with ATF or a light coat of wheel bearing grease.

The following notice applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology NOTICE: See ‘Notice’ on page 5A-1 of this section.

NOTICE: This fastener is an important attaching part in that it could affect the performance of vital components and system, and/or could result in major repair expense. It must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of this part.

CAUTION: When servicing wheel brake parts, do not create dust by grinding or sanding brake linings or by cleaning wheel brake parts with a dry brush or with compressed air. (A water dampened cloth should be used). Many wheel brake parts contain asbestos fibers which can become airborne if dust is created during servicing. Breathing dust containing asbestos fibers may cause serious bodily harm.

BRAKE SYSTEM DIAGNOSIS

ROAD TESTING THE BRAKES

The brakes should be tested on a dry, clean, reasonably smooth and level roadway. A true test of brake performance cannot be made if the roadway is wet, greasy or covered with loose dirt so that all the tires do not grip the road equally. The testing will be adversely affected if the roadway is crowned so as to throw the weight of the vehicle toward the wheels on one side or if the roadway is so rough that the wheels tend to bounce.

Test the brakes at different vehicle speeds with both light and heavy pressure; however, avoid locking the wheels and sliding the tires on the roadway. Locked wheels and sliding tires do not indicate brake efficiency since heavily braked turning wheels will stop the vehicle in less distance than locked wheels. More tire-to-road friction is present with a heavily braked turning tire than with a sliding tire.

EXTERNAL CONDITIONS THAT AFFECT BRAKE PERFORMANCE

1. Tires—Tires having unequal contact and grip on the road will cause unequal braking. The tires must be equally inflated and the tread pattern of the right and left tires must be about equal.

2. Vehicle Loading—When the vehicle has unequal loading, the most heavily loaded wheels require more braking power than the others.

3. Front Wheel Bearings—Loose front wheel bearings permit the disc to tilt and have spotty contact with the linings causing erratic action.

4. Front End Alignment—Misalignment of the front end, particularly in regard to limits on camber and caster, will cause the brakes to pull to one side.

HYDRAULIC BRAKES 5A-5

ON VEHICLE SERVICE

BLEEDING THE BRAKE HYDRAULIC SYSTEM

A bleeding operation is necessary if air has been introduced into the hydraulic brake system.

It may be necessary to bleed the system at all four wheels if air has been introduced by a low fluid level condition in the master cylinder or if the brake pipes have been disconnected at either the master cylinder or the combination valve. If a pipe is disconnected at one wheel, then only bleed that particular wheel.

The time required to bleed the hydraulic system when the master cylinder is removed can be reduced if the master cylinder is filled with fluid and as much air as possible is bled from the cylinder before installing it on the vehicle.

MANUAL BLEEDING

If the vehicle is equipped with power brakes, deplete the vacuum reserve by applying the brakes several times with the engine off.

Use extreme care to prevent brake fluid from contacting any painted surface.

1. Fill the master cylinder reservoirs with brake fluid specified in MAINTENANCE AND LUBRICATION (Sec. OB).
   - Maintain the fluid level in the reservoir during the bleeding operation.
2. If the master cylinder is suspected to have air in the bore, it must be bled before any wheel cylinder or caliper.
   - Remove the forward brake pipe connection at the master cylinder.
   - Allow brake fluid to flow from the connector port.
   - Connect the brake pipe but do not tighten.
3. Slowly depress the brake pedal allowing the air to bleed from the loose fitting.
   - Tighten the fitting before releasing the pedal.
   - Wait 15 seconds, and repeat this sequence, including the 15 second wait until all the air is purged from the bore.
4. After all the air has been removed from the forward connection disconnect the rear pipe.
   - Allow brake fluid to flow from the connector port.
   - Connect the brake pipe but do not tighten.
5. Slowly depress the brake pedal allowing the air to bleed from the loose fitting.
   - Tighten the fitting before releasing the pedal.
   - Wait 15 seconds, and repeat this sequence, including the 15 second wait until all the air is purged from the bore.
6. If it is known that the calipers and wheel cylinders do not contain any air, then it will not be necessary to continue. Otherwise bleed each wheel in the following sequence.
   - Right rear
   - Left rear
   - Right front

7. Attach a hose to the wheel cylinder/caliper bleeder screw.
   - Immerse the opposite end of the hose into a container partially filled with clean brake fluid.
8. Slowly depress the brake pedal one time and hold.
   - Loosen the bleeder screw to purge the air from the wheel cylinder/caliper.
   - Tighten the bleeder screw and slowly release the pedal.
   - Wait 15 seconds, then repeat this sequence, including the 15 second wait until all the air is purged from the wheel cylinder/caliper.
9. Continue steps 7 and 8 at each wheel until the entire brake system has been bled.
10. Check the brake pedal for "sponginess" and the brake warning lamp for an indication of an unbalanced pressure. Repeat the entire bleeding procedure to correct either of these two conditions.

PRESSURE BLEEDING

The pressure bleeding equipment must be of the diaphragm type. It must have a rubber diaphragm between the air supply and the brake fluid to prevent air, moisture, oil, and other contaminants from entering the hydraulic system. Also adapters are needed depending on the type of master cylinder used.

Tools Required:
- J-29567 Brake Bleeder Adapter (Plastic Reservoir)
- J-23518-01 Brake Bleeder Adapter (Cast Iron Reservoir)
- J-23709 Combination Valve Depressor

NOTICE: It is very important that the correct master cylinder bleeder adapter be used to avoid possible damage to the master cylinder reservoir.

1. Fill the pressure tank at least 1/3 full of brake fluid. The bleeder must be re-bled each time fluid is added.
   - Charge the bleeder to 140 - 170 kPa (20 to 25 psi).
2. Use J-23709 to depress and hold the valve stem on the combination valve during the bleeding operation (figure 1).
   - Install the correct bleeder adapter (figures 2 and 3).
3. Bleed each wheel in the following sequence.
   - Right rear
   - Left rear
   - Right front
   - Left front
4. Connect the hose from the bleeder to the adapter at the master cylinder.
   - Open the tank valve.
5. Attach a hose to a brake bleeder screw.
   - Immerse the opposite end of the hose into a container partially filled with clean brake fluid.
5A-6 HYDRAULIC BRAKES

Figure 1—Installing Combination Valve Depresser

6. Open the bleeder screw at least ¾ of a turn and allow the fluid to flow until no air is seen in the fluid.
   - Close the bleeder screw.
7. Repeat step six at all the wheels.
8. Check the brake pedal for “sponginess”, repeat the entire bleeding procedure if this condition is found.
   - Disconnect the line from the bleeder adapter.
   - Remove bleeder adapter.
10. Fill the master cylinder to the proper level with brake fluid.

Figure 3—Cast Iron Reservoir Bleeder Adapter

FLUSHING THE BRAKE HYDRAULIC SYSTEM

It is recommended that the entire hydraulic system be thoroughly flushed with clean brake fluid whenever new parts are installed in the hydraulic system.

Flushing is also recommended if there is any doubt as to the grade of fluid in the system or if fluid has been used which contains the slightest trace of mineral oil. Flush the system whenever there is any question of contamination.

Flushing is performed at each bleeder valve in the same manner as the bleeding operation, except that the bleeder valve is opened 1 1/2 turns and the fluid is forced through the lines and bleeder valves until it emerges clear in color. Refer to “Bleeding the Brake Hydraulic System”, in this section.

Check master cylinder fluid level after flushing at each valve and replenish if required. When flushing is completed at all bleeder valves, make certain the master cylinder reservoir is filled to proper level.

Figure 2—Plastic Reservoir Bleeder Adapter

BRAKE PIPES AND HOSES

The hydraulic brake system components are interconnected by special steel piping and flexible hoses. Flexible hoses are used between the frame and the front calipers, and the frame and rear differential. When the hydraulic pipes have been disconnected for any reason, the brake system must be bled after reconnecting the pipe, refer to “Bleeding the Brake Hydraulic System” in this section.
FLEXIBLE HOSE
On the front brakes the hose is connected to the caliper with a bolt and copper washers. The fitting at the other end of the hose is secured at the frame with either a nut or a clip.

At the rear differential one end of the hose is connected to the differential with a bolt. The other end is secured at the frame with either a nut or a clip.

Flexible Hose Inspection
The flexible hoses should be inspected for any signs of road damage which will cause cracks and chafing of the other cover. If any of these conditions are visible, replace the hose.

Hose Replacement

Remove or Disconnect (Figure 4)
- Clean dirt, grease, and other foreign material off the hose fittings at both ends.
  1. Steel pipe.
  2. Clip or nut (31).
  4. Washers (33).
  5. Hose (32).

Install or Connect (Figure 4)
- Use new copper washers when installing the hose.
  1. Hose (32).
- The hose must not be twisted.

Important
- The hose installation must not contact any suspension components.
  2. Washers (33).
  4. Clip or nut (31).
  5. Steel pipe.
- Bleed the brakes, refer to “Bleeding the Brake Hydraulic System” in this section.

BRAKE PIPES
When replacing a steel brake pipe, always use steel piping which is designed to withstand high pressure and resist corrosion. The same size pipe must be used as the one removed.

NOTICE: Never use copper tubing for hydraulic brake lines because copper is subject to fatigue cracking, and corrosion which could result in brake failure.

Brake pipes that run parallel to each other must maintain a 6 mm (¼-inch) clearance.

Pipe Flaring (Figure 5)
Tools Required:
- J-23530 Flaring Tool.
- J-23533-B Tube Cutter.

In order to ensure a proper flare, a special flaring tool must be used. When using the tool, instruction furnished by the tool manufacturer should be followed. Always inspect newly formed flares for cracks or malformations which might cause leaks. After flaring, blow out the brake pipe with compressed air before installing on the vehicle.

NOTICE: Double lap flaring tool must be used, as single flaring tools cannot produce a flare strong enough to hold the necessary pressure.

1. Use steel pipe and fittings of the correct size. The outside diameter of the pipe is used to specify the size.
2. Cut the pipe to length. Add 3 mm (¼-inch) to the length for each flare.
3. Flare the pipe ends by following the instructions with the tool.
4. Bend the pipe to match the old pipe by using a pipe bender.

COMBINATION VALVE
The combination valve is comprised of three sections, each serving a different function (figure 6).

The metering or hold off section of the valve limits the pressure to the front disc brakes until a predetermined front input pressure is reached, enough to overcome the rear shoe retractor springs. There is no restriction to the inlet pressures below 20 kPa (3 psi) to allow for pressure equalization during the no apply periods.

The proportioning section of the combination valve proportions outlet pressure to the rear brakes after a predetermined rear input pressure has been reached. This is done to prevent rear wheel lock-up on the vehicles with light rear wheel loads.

The valve is designed to have a By-Pass feature which assures full system pressure to the rear brakes in the event of a front brake system malfunction, also full front pressure is retained in the event of rear malfunction.

The pressure differential warning switch is designed to constantly compare front and rear brake pressure from the master cylinder and energize the warning lamp on the dash in the event of a front or rear system malfunction. The valve and switch are so designed that the switch will latch in the “warning” position once a malfunction has occured. The only way the lamp can be turned off is to repair the malfunction and apply a pedal force required to develop about 3102 kPa (450 psi) line pressure.

ELECTRICAL CIRCUIT TEST
1. Disconnect the wire from the switch on the valve.
   - Connect a jumper wire from the switch wire to ground.
2. Turn the ignition key to “ON”.
   - The warning lamp should light.
   - If the lamp will not light check the bulb. If the bulb is good, refer to Chasis Electrical (Sec. 8B) for further diagnosis.
3. Turn the ignition off.
   - Disconnect jumper wire and connect the wire to the switch terminal.

Valve Warning Switch Test
1. Raise the vehicle.
   - Support with suitable safety stands.
2. Attach a hose to a rear brake bleeder screw.
   - Immerse the opposite end of the hose into a container partially filled with clean brake fluid.
   - Make sure the master cylinder reservoir is full.
31. Nut or Clip
32. Flex Hose
33. Washer
34. Bolt

Figure 4—Flexible Hoses
3. Turn the ignition key to "ON".
   • Open the bleeder screw while a helper applies moderate pressure to the brake pedal.
   • The warning lamp should light.
   • Close the bleeder screw before the helper releases the brake pedal.
4. Reapply the brake pedal with moderate to heavy pressure.
   • The lamp should go out.
5. Attach a hose to a front brake bleeder screw.
   • Immerse the opposite end of the hose into a container partially filled with clean brake fluid.
   • Make sure the master cylinder reservoir is full.
6. Open the bleeder screw while a helper applies moderate pressure to the brake pedal.
   • The warning lamp should light.
   • Close the bleeder screw before the helper releases the brake pedal.
7. Reapply the brake pedal with moderate to heavy pressure.
   • The lamp should go out.
8. Turn the ignition key off.
   • If the warning lamp does not light during steps 3 and 6 but does light when a jumper is connected to ground, the warning switch portion of the valve is faulty. Do not disassemble any portion of the valve. It must be replaced.
9. Remove the safety stands.
   • Lower the vehicle.
   • Check and fill the master cylinder to the proper level.

VALVE REPLACEMENT

Remove or Disconnect (Figure 7)

- The combination valve is not repairable and must be replaced as a complete assembly.
- Care must be taken to prevent brake fluid from contacting any painted surface.
1. Hydraulic pipes.
   • Plug the pipes to prevent the loss of fluid or the entrance of dirt.
2. Warning switch harness.
4. Combination valve.

Install or Connect (Figure 7)

1. Position valve on the bracket.
2. Bolts.
3. Warning switch harness.
   • Bleed the brake system. Refer to "Bleeding Brake System" in this section.

HEIGHT SENSING BRAKE PROPORTIONING VALVE

The height sensing brake proportioning valve is used on series 30 models (figure 8). This will provide optimum brake balance and efficiency. The vehicle braking force is distributed to the front and rear wheels as determined by either a light or heavy payload condition.

Figure 7—Combination Valves
The valve is mounted on the frame, and a linkage connects the valve to a bracket that is mounted on the axle.

CAUTION: Adding any suspension accessories or other equipment (such as load leveling kits, air shocks, suspension lift kits, additional spring leafs, etc.), or making modification that will change the distance between the axle and the frame without changing the load, will provide a false reading to the brake proportioning valve. This could result in unsatisfactory brake performance which in turn could result in an accident and possibly personal injury.

**PROPORTIONING VALVE ADJUSTMENT**

If a front wheel lockup is experienced when the vehicle is being operated near the maximum GVWR with a lower than desired brake application, the valve adjustment should be checked. Use the following procedure to check the adjustment.

1. Raise the vehicle.
   - Support the frame with suitable safety stands. The axle must be allowed to hang free.
2. Remove the nut from the valve shaft.
   - Remove the lever.
3. Select the appropriate adjustment gage from the chart.

CHECKING PEDAL TRAVEL

At frequent intervals the brake pedal should be checked for travel. Travel is the distance the pedal moves toward the floor from a full released position. This check should be made with the brakes cold and about 122 N (90 lbs.) of force on the pedal. On vehicles with power brakes the pedal must be pumped at least three times with the engine off before making the check. Follow the specifications below for the correct travel.

Inspect
- All parts for discoloration due to heat, or stress. Replace if necessary.
- Brake drum for scoring and heat spots. Machine drum if needed.

PARKING BRAKE ADJUSTMENT
The parking brakes must be adjusted whenever the parking brake cables have been replaced or disconnected. Also if the brake holding ability is not adequate. Before adjusting the parking brakes check the condition of the service brakes. The service brakes must be adjusted properly before proceeding with the parking brake adjustment.

CABLE INSPECTION
Check the parking brake system for free operation. The brake lever must return to the released position without sticking or binding. If a problem is present check the cable routings for kinks or binding. Clean and lubricate the parking brake assembly and cables with Delco brake lube or equivalent.

FOOT PEDAL TYPE
1. Block the front wheels.
   - Raise and support the rear axle with suitable safety stands.
  2. Loosen the equalizer nut.
  3. Set the parking brake pedal to four clicks.

Adjust
- Equalizer nut until the wheels rotate forward with a moderate drag.
  4. Release the parking brake and rotate the rear wheels. There should be no brake drag.
  5. Remove the safety stands and lower the vehicle.
  6. Unblock the front wheels.

LEVER TYPE
1. Block the front wheels.
   - Raise and support the rear axle with suitable safety stands.
  2. Turn the adjusting knob on the parking brake lever counterclockwise until it stops.
   - Apply parking brake.
  3. Loosen the equalizer nut.

5. Remove the safety stands and lower the vehicle.
6. Unblock the front wheels.

INTERNAL EXPANDING (PROPELLER SHAFT)

CAUTION: See “Caution” on page 5A-1 of this section.

1. Block the front wheels.
   - Raise and support the rear axle with suitable safety stands.
2. Remove the clevis pin connecting the pull rod and relay lever.
3. Rotate the brake drum to align the access hole with the adjusting screw.
   - Manual transmissions - the adjusting screw is located at the bottom of the shoe.
   - Automatic transmission - the adjusting screw is located at the top of the shoe.

When adjusting the parking brake for the first time, it will be necessary to remove the lanced area from the drum. The drum must be removed to clean out all the metal shavings. Refer to PROPELLER SHAFTS (Sec. 4A).

Adjust
- Adjusting screw until the drum cannot be rotated by hand.
- Back off the adjusting screw ten notches. The drum should rotate freely.
4. Place parking brake lever in the full release position.
5. Take up the slack in the cable to overcome the spring tension.

Adjust
- The clevis of the pull rod to align with the hole in the relay lever.
6. Install the clevis pin.
7. Install new cover in the drum access hold.
8. Remove the safety stands and lower the vehicle.
9. Unblock the front wheels.

MASTER CYLINDERS

There are two designs of master cylinders available depending on the brake option.

One is a full cast iron design incorporating a conventional front to rear brake split (figure 24). The primary piston provides the fluid pressure to the front brakes, while the secondary piston provides the fluid pressure to the rear brakes. If the pressure is lost from either system, the remaining system will function to stop the vehicle.

The second style master cylinder is designed for use with a system using the low drag calipers (figure 25). In addition to the standard master cylinder functions, a quick take-up feature is included. This provides a large volume of fluid to the wheels at low pressure with the initial brake application. This large volume of fluid is needed to overcome the clearance created by the seal retracting the pistons into the front calipers and the spring retraction of the rear drum brake shoes.

### MASTER CYLINDER REPLACEMENT

Remove or Disconnect (Figure 26)

- Apply the vehicles parking brakes.
1. Brake pipes.
   - Cover the ends of the pipes to prevent dirt from entering the system.
Figure 26—Master Cylinder Installations
5A-26 HYDRAULIC BRAKES

- If the vehicle is equipped with manual brakes, refer to "Brake Pedal Replacement" for the removal of the pushrod from the pedal.

Install or Connect (Figure 26)
- Prior to installation, refer to "Bench Bleeding" in this section.
- Master cylinder.
  - If the vehicle is equipped with manual brakes, refer to "Brake Pedal Replacement" for the installation of the pushrod to the pedal.

NOTICE: See "Notice" on page 5A-1 of this section.

   - Nuts to 27 N·m (20 ft. lbs.), G and P models.
3. Brake pipes.
4. Bleed the brakes, refer to "Bleeding the Brake Hydraulic System" in this section.
- Release the parking brakes.

BENCH BLEEDING

The purpose of bench bleeding is to remove the air from the master cylinder so when it is installed on the vehicle, the brake system bleeding will be reduced.

1. Plug the outlet ports and mount the master cylinder in a vise with the front end tilted slightly down.
2. Fill the reservoir with clean brake fluid.
   - Using a tool with a smooth rounded end tool, stroke the primary piston about 25 mm (1-inch) several times.
   - As air is bled from the master cylinder, with the outlets plugged, the resistance to the primary piston travel will not allow the full 25 mm (1-inch) stroke.
3. Reposition the master cylinder in the vise with the front end of the master cylinder tilted slightly up. Again stroke the primary piston about 25 mm (1-inch) several times.
4. Reposition the master cylinder in the vise to the level position. Loosen the plugs one at a time and push the piston into the bore to force the air from the cylinder. To prevent air from being sucked back into the cylinder, tighten the plug(s) before allowing the piston to return to its original position.
5. Fill the reservoir.
   - Normal bleeding procedures should be followed after the master cylinder is installed.

HYDRAULIC BRAKE BOOSTER SYSTEMS

The following notice applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology NOTICE: See ‘Notice’ on page 5A1-1 of this section.

NOTICE: This fastener is an important attaching part in that it could affect the performance of vital components and system, and/or could result in major repair expense. It must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of this part.

HYDRAULIC BRAKE BOOSTER SYSTEMS

HYDRO-BOOST SYSTEM TESTS

The Hydro-Boost system receives its source of power from the power steering system. Therefore a malfunctioning power steering system may affect the operation of the booster, just as a problem in the booster may affect the steering system. Prior to performing any tests, the following checks must be made.

1. Check all the power steering and brake pipe connections for leaks or restriction.

   NOTICE: Power steering fluid and brake fluid cannot be mixed. If brake seals contact steering fluid or steering seals contact brake fluid, seal damage will result.

2. Check and fill the brake master cylinder with brake fluid.

3. Check and fill the power steering reservoir with power steering fluid. If fluid contains air refer to POWER STEERING (Sec. 3B3) for further diagnosis.

4. Check power steering pump belt for wear and tension. Adjust if needed, refer to POWER STEERING (Sec. 3B3).

5. Check engine idle speed, refer to the vehicle's Emission Control Information label for idle specifications.

6. Check steering pump pressure. Refer to POWER STEERING (Sec. 3B3).

NOISE DIAGNOSIS

The following noises are associated with the Hydro-Boost and may or may not be cause for customer complaint. Some noises are normal and for the most part temporary in nature. Other noises may be a sign of excessive wear or the presence of air in either the booster or the steering system.

1. A moan or low frequency hum usually accompanied by a vibration in the pedal or steering column may be observed during parking maneuvers or other low speed maneuvers. This may be caused by a low fluid level in the power steering pump or by air in the fluid. Holding the pump at relief pressure (steering wheel held all the way in one direction) for more than five seconds will cause air to enter the system. Check the fluid level and fill if needed. The system must then sit for one hour to remove the air. If the condition persists, refer to POWER STEERING (Sec. 3B3).

2. A high speed fluid noise may be heard when the brake pedal is fully depressed, this condition is normal.

3. Whenever the accumulator pressure is used, a slight hiss may be noticed. It is the sound of the hydraulic fluid escaping through the accumulator valve, and is completely normal.

4. After the accumulator has been emptied, and the engine is started again, another hissing sound may be heard during the first brake application or the first steering maneuver. This is caused by the fluid rushing through the accumulator charging orifice. It is normal and will only be heard once after the accumulator is emptied. However, if this sound continues, even though no apparent accumulator pressure assist was made, it could be an indication that the accumulator is not holding pressure and should be checked using the procedure for the "Accumulator Leakdown Test" in this section.

BOOSTER FUNCTIONAL TEST

With the engine off, apply the brake pedal several times until the accumulator is completely depleted. Depress the brake pedal using 180 N (40 lbs.) of force and start the engine. The pedal will fall and then push back against your foot.

ACCUMULATOR LEAKDOWN TEST

1. Start the engine and charge the accumulator by applying the brake pedal or by turning the steering wheel from stop to stop. Turn off the engine and let the vehicle sit for one hour. After one hour there should be at least two power assisted applications with the engine off.

2. If the reserve system will not retain a charge for one hour, but functions normally immediately following charging, the accumulator valves are at fault and the booster must be disassembled and the accumulator valves replaced.

3. If the accumulator can be heard charging and discharging, but it does not hold a charge, disassemble the booster and replace the accumulator valves.
4. Deplete the accumulator by pressing the brake pedal several times. If the accumulator can has lost its gas charge, it is possible to rotate or wobble the accumulator can with respect to the housing. Replace the accumulator assembly.

SEAL LEAK DIAGNOSIS (FIGURE 1)
A. INPUT ROD SEAL. A damaged seal will show up as a fluid leak from the mounting bracket vent hole. The booster must be removed from the vehicle and disassembled. The input rod bore should be checked for any scratches that may cause the leak. If scratches are present, the housing cover must be replaced. If no excessive scratches are present, then the booster seal kit can be used to replace the appropriate seals.

B. POWER PISTON SEAL. Power piston seal damage will be noticed by fluid leaking out at the common master cylinder brake booster vent and possible reduction in power assist. The booster must be removed from the vehicle and disassembled. The piston should be checked for any scratches that may be the cause of the leak. If scratches are present, then the booster seal kit can be used to replace the appropriate seals.

C. HOUSING SEAL. If the housing seal is damaged, fluid will leak out from between the two housings. The booster must be removed from the vehicle and disassembled. The booster seal kit should be used to replace the housing and input rod and power piston seals.

D. SPOOL VALVE PLUG SEAL. Damage to this seal will be noticed by fluid leaking out past the plug. The booster need not be removed from the vehicle.

E. ACCUMULATOR SEAL. Damage to this seal will result in fluid leakage past the accumulator cap. The seal can be replaced while the booster is installed on the vehicle.

F. RETURN PORT FITTING. Tighten the fitting to 10 N·m (7 ft. lbs.). If the leak continues, replace the seal ring under the fitting.

VACUUM BOOSTERS

DESCRIPTION

SINGLE DIAPHRAGM MODEL
This booster is a single diaphragm vacuum suspended unit. It may have a single function vacuum switch to activate the brake warning light in case of low booster vacuum or vacuum pump malfunction. In a normal operating mode, with the service brakes in the released position, a vacuum suspended booster operates with vacuum on both sides of its diaphragm. When the brakes are applied, air at atmospheric pressure is admitted to one side of the diaphragm to provide the power assist.

TANDEM DIAPHRAGM MODEL
This booster is a tandem vacuum suspended unit. It may have a single dual function vacuum switch to activate the brake warning light in case of low booster vacuum or vacuum pump malfunction. In a normal operating mode, with the service brakes in the released position, a tandem vacuum suspended booster operates with vacuum on both sides of its diaphragms. When the brakes are applied, air at atmospheric pressure is admitted to one side of each diaphragm to provide the power assist.

**HYDRAULIC BRAKE BOOSTER (HYDRO-BOOST)**

**DESCRIPTION**

This system uses a hydraulic pump to power the system and a pneumatic accumulator as a reserve system.

In this system, no special fluids are used, however, care must be taken to use the correct fluids. The master cylinder and brake system operate on standard hydraulic brake fluid, while the hydraulic pump operates on power steering fluid. For diagnosis of the Hydro-Boost System, refer to “Hydro-Boost Systems Tests” and “Diagnosis of Hydro-Boost System” in this section.

BLEEDING THE HYDRO-BOOST SYSTEM

Whenever the booster is removed and reinstalled, the steering system should be bled.

NOTICE: The power steering fluid and brake fluid cannot be mixed. If the brake seals contact steering fluid or the steering seals contact brake fluid, seal damage will result.

1. Fill the power steering pump reservoir to the proper level and let the fluid remain undisturbed for at least two minutes.
2. Start the engine and run momentarily.
   • Add fluid, if necessary.
3. Repeat steps 1 and 2 until the fluid level remains constant after running the engine.
4. Raise the front of the vehicle so the wheels are off the ground.
   • Support the vehicle with suitable safety stands.
5. Turn the wheels from stop to stop, lightly contacting the stops.
   • Add fluid, if necessary.
6. Lower the vehicle.
7. Start the engine and depress the brake pedal several times while rotating the steering wheel from stop to stop.
8. Turn the engine off and then pump the brake pedal 4-5 times.
9. Check fluid level, add fluid if necessary.
10. If the fluid is extremely foamy, allow the vehicle to stand a few minutes with the engine off. Then repeat steps 7, 8 and 9.
11. Check for the presence of air in the oil. Air in the oil will have a milky appearance. Air in the system will also cause the fluid level in the pump to rise when the engine is turned off. If it becomes obvious that the pump will not bleed the air after a few attempts, refer to POWER STEERING (Sec. 3B3) for further diagnosis.

SECTION 5A2

HYDRAULIC FOUNDATION BRAKES

The following notice applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology NOTICE: See 'Notice' on page 5A2-1 of this section.

NOTICE: This fastener is an important attaching part in that it could affect the performance of vital components and system, and/or could result in major repair expense. It must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of this part.

CAUTION: When servicing wheel brake parts, do not create dust by grinding or sanding brake linings or by cleaning wheel brake parts with a dry brush or with compressed air. (A water dampened cloth should be used). Many wheel brake parts contain asbestos fibers which can become airborne if dust is created during servicing. Breathing dust containing asbestos fibers may cause serious bodily harm.

DISC BRAKES

DESCRIPTION
The disc brake assembly consists of a caliper and piston assembly, rotor, linings, and an anchor plate. The caliper is mounted to the anchor plate, which allows the caliper to move laterally against the rotor. The caliper is a one-piece casting with the inboard side containing the piston bore. A square cut rubber seal is located in a groove in the piston bore which provides the hydraulic seal between the piston and the cylinder wall.

OPERATION
As the brake pedal is depressed, hydraulic pressure is applied against the piston. This pressure pushes the inboard brake lining against the inboard braking surface of the rotor. As the force increases against the rotor, the caliper assembly moves inboard thus providing a clamping action on the rotor.

When the brake pressure is released, the piston seal returns to its normal position, pulling the piston back into the caliper bore. This will create a running clearance between the inner brake lining and the rotor.

BRAKE LINING INSPECTION
Check the outer pad by looking at each end of the caliper (figure 1). Check the lining thickness on the inner pad by looking down through the inspection hole in the top of the caliper housing. Whenever the lining is worn to about the thickness of the pad, the lining should be removed for further measurements. The pad should be replaced anytime the lining is worn to within 0.80 mm (1/32-inch) of a rivet head or the pad itself.
The disc brake pads have a wear indicator that makes a noise when the linings wear to a degree where replacement is required (figure 2). Also check the flatness of the brake pads. Place the inboard and outboard lining surfaces together and check for a gap between the lining surfaces. This gap should not exceed 0.13 mm (.005-inch) at the middle of the lining surfaces. This applies to new or used brake pads.

### Remove or Disconnect (Figure 3)

- Two-thirds of the brake fluid from the master cylinder.
- Raise the vehicle and support it with suitable safety stands.
- Mark the relationship of the wheel to the hub.
1. Wheel and tire assembly, refer to WHEELS AND TIRES (Sec. 3E).

**CAUTION:** See “Caution” on page 5A2-1 of this section.

- Position a C-clamp around the outer pad and caliper and tighten until the piston bottoms in its bore (figure 4).
2. C - clamp
3. Mounting bolts  (figure 5).
5. Inboard pad (6).
6. Retainer spring (5).
7. Outboard pad (7).

![Figure 2—Warning Sensor](B-07841)

**Important**

- Do not allow the brake components to hang from the flexible hoses as damage to the hoses may occur.
Inspect
- The inside of the caliper assembly for signs of fluid leakage, if found, refer to “Rebuilding the Caliper” in this section.
- Mounting bolts and sleeves for corrosion. Do not attempt to polish away corrosion, replace the bolts.

Install or Connect (Figure 3)
- Lubricate the sleeves and bushings with Delco Silicone Lube or equivalent.

2. Sleeves (2).
3. Retainer spring (5) onto the inboard pad (6).
4. Inboard pad (6).
5. Outboard pad (7).
6. Caliper assembly.

Important
- Make sure that the brake hose is not twisted or kinked since damage to the hose could result.

NOTICE: See “Notice” on page 5A2-1 of this section.

Tighten
- Bolts to 48 N-m (35 ft. lbs.)
- Compress the pad ears to the caliper (figure 7).

Measure (Figure 8)
- The clearance between the caliper and the steering knuckle. The clearance at each end of the caliper should be measured individually and added together, this total should between 0.26 - 0.60 mm (0.010 - 0.024-inches).

Wheel and tire assembly, refer to WHEELS AND TIRES (Sec. 3E).
- Lower the vehicle.
Important

- Before moving the vehicle, pump the brake pedal several times to make sure that the pedal is firm. Do not move the vehicle until a firm pedal is obtained. Check the brake fluid level in the master cylinder after pumping the brakes.

8. Outboard pad (7).

**Inspect**
- The inside of the caliper assembly for signs of fluid leakage, if found, refer to “Rebuilding the Caliper” in this section.

**Clean**
- Use a wire brush to remove any corrosion from the machined surfaces of the steering knuckle and caliper.

**Install or Connect (Figures 9 and 10)**
- Lubricate the caliper and steering knuckle (or support) sliding surfaces and spring with Delco Silicone Lube or equivalent.
1. Inboard pad (6) and anti-rattle spring (11).
2. Outboard pad (7) into the caliper assembly.
3. Caliper assembly.

**Important**
- Make sure that the brake hose is not twisted or kinked since damage to the hose could result.

4. Spring (10) and support key (9).
   - Use a brass punch and a hammer to drive the support key in (figure 14).

**NOTICE:** See “Notice” on page 5A2-1 of this section.

5. Bolt (8).
   - The boss on the bolt must fully fit into the circular cutout in the key.
Tighten

- Bolt to 20 Nm (15 ft. lbs.).

6. Wheel and tire assembly, refer to WHEELS AND TIRES (Sec. 3E).
- Lower the vehicle.

Important

- Before moving the vehicle, pump the brake pedal several times to make sure that the pedal is firm. Do not move the vehicle until a firm pedal is obtained. Check the brake fluid level in the master cylinder after pumping the brakes.

SERVICING THE ROTOR

In the manufacturing of the brake rotor all the tolerances regarding surface finish, parallelism, and lateral runout are held very closely. The maintenance of these tolerances provide the surface necessary to prevent brake roughness.

Light scoring of the rotor surface not in excess of 0.38 mm (0.15-inch) in depth is normal. This condition does not affect the brake operation.

LATERAL RUNOUT

Lateral runout is the movement of the rotor from side to side as it rotates on the spindle. This could also be referred to as "rotor wobble".

This movement causes the brake pad and piston to be knocked back into its bore. This results in additional pedal travel and a vibration during braking.

Checking Lateral Runout (Figure 15)

1. Tighten the wheel bearings to eliminate all freeplay.
2. Attach a dial indicator to some portion of the suspension.
   - The point of the styles must contact the rotor face about 25 mm (1-inch) from the rotor edge.
3. Move the rotor one complete rotation.
   - The lateral runout should not exceed 0.10 mm (0.004-inch).
4. Adjust the wheel bearings, refer to FRONT SUSPENSION (Sec. 3C).

PARALLELISM

Parallelism is the measurement of the thickness of the rotor at four or more points around the circumference of the rotor. All measurements must be made at the same distance in from the edge of the rotor. The rotor thickness must not vary more than 0.013 mm (0.0005-inch) from point to point.

MACHINING

Since accurate control of the rotor tolerances is necessary for proper performance of the disc brakes, machining of the rotor should be done only with precision equipment.

All brake rotors have a minimum thickness dimension cast into them. This dimmension is the minimum wear dimension and not a refinish dimension. Do not use a brake rotor that will not meet the specifications, after refiinishing. Replace with a new brake rotor. Refer to "Specifications" in this section for final machining tolerances.

REBUILDING THE CALIPER

3000/3100 MODELS

Remove or Disconnect (Figure 16)

- Drain all the fluid from the caliper.
- Pad the interior of the caliper with clean shop towels.

CAUTION: Do not place your fingers in front of the piston in an attempt to catch or protect it when applying compressed air. This could result in serious injury.

NOTICE: Use just enough air to ease the piston out of the bore. If the piston is blown out—even with padding provided, it may be damaged.

1. Piston (22) by directing compressed air into the caliper fluid inlet (figure 17)
   - Use just enough air pressure to ease the piston out of the bore.
2. Boot (23) (figure 18).
   - Use care not to scratch the housing bore.
3. Piston seal (21).
   - Do not use any type of metal tool.

Clean

- Bleeder valve, caliper bore, caliper passages, and piston with denatured alcohol. Use dry, filtered compressed air to dry parts and blow out passages.

Inspect
- Piston for scoring, corrosion and any damage to the chrome plating, replace if found.
- Caliper bore for scoring, pitting, or corrosion. Use crocus cloth to polish out any light corrosion. Replace caliper if corrosion cannot be removed.

Install or Connect (Figure 16)
Tool required:
J-26267 Piston Seal Installer
- Lubricate the new piston seal, caliper bore, and piston with clean brake fluid.
1. Piston seal (21).
   - Make sure the seal is not twisted in the caliper bore groove.

Remove or Disconnect (Figure 20)
- Drain all the fluid from the caliper.
- Pad the interior of the caliper with clean shop towels.

CAUTION: Do not place your fingers in front of the piston in an attempt to catch or protect it when applying compressed air. This could result in serious injury.

NOTICE: Use just enough air to ease the piston out of the bore. If piston is blown out—even with padding provided, it may be damaged.

1. Piston (22) by directing compressed air into the caliper fluid inlet (figure 17).
   • Use just enough air pressure to ease the piston out of the bore.
2. Boot (23).
3. Piston seal (21).
   • Do not use any type of metal tool.

Clean
• Bleeder valve, caliper bore, caliper passages, and piston with denatured alcohol. Use dry, filtered compressed air to dry parts and blow out passages.

Inspect
• Piston for scoring, corrosion and any damage to the chrome plating, replace if found.
• Caliper bore for scoring, pitting, or corrosion. Use copper cloth to polish out any light corrosion. Replace caliper if corrosion cannot be removed.

Install or Connect (Figure 20)

Tool required:
J-24548 Piston Seal Installer

• Lubricate the new piston seal, caliper bore, piston, and seal lips on boot with clean brake fluid.
1. Piston seal (21).
   • Make sure the seal is not twisted in the caliper bore groove.
2. Boot (23) on tool J-24548.
   • Place the large diameter of the boot over the tool first and ride the smaller diameter onto the tool.
   • The large diameter must then slide off the tool.
DESCRIPTION

The drum brake assembly is a duo-servo design. With this particular design, the force which is applied by the wheel cylinder to the primary shoe is multiplied by the primary lining friction to provide a large applied force to the secondary shoe. The torque from the brake shoes is transferred to the anchor pin and through the backing plate, to the axle flange. Brake adjustments are automatic and are made during reverse brake applications.

BRAKE LINING REPLACEMENT

Remove or Disconnect (Figure 22)

- Raise the vehicle and support with suitable safety stands.
- Mark the relationship of the wheel to the hub.

1. Wheel and tire assembly, refer to WHEELS AND TIRES (Sec. 3E).

    • Align the marks made during disassembly.
    • Adjust the brakes, refer to “Brake Adjustment” in this section.

SERVICING THE BRAKE DRUM
Whenever the brake drums are removed, they should be thoroughly cleaned and inspected for cracks, scores, deep grooves and out-of-round.

CRACKED, SCORED, OR GROOVED DRUM
A cracked drum is unsafe for further service and must be replaced. Do not attempt to weld a cracked drum.

Smooth up any slight scores. Heavy or extensive scoring will cause excessive brake lining wear, and it will probably be necessary to machine the drum braking surface.

If the brake linings are slightly worn and the drum is grooved, the drum should be polished with fine emery cloth but should not be machined. At this stage, eliminating all the grooves in the drum and smoothing the ridges on the lining would require the removal of too much metal and lining, while if left alone, the grooves and ridges match and satisfactory service can be obtained.

If brake linings are to be replaced, a grooved drum should be machined. A grooved drum, if used with a new lining, will not only wear the lining, but will make it difficult, if not impossible to obtain efficient brake performance.

OUT-OF-ROUND OR TAPERED DRUM
An out-of-round drum makes accurate brake shoe adjustment impossible and is likely to cause excessive wear of other parts of the brake mechanism due to its eccentric action. An out-of-round drum can also cause severe and irregular tire tread wear as well as a pulsing brake pedal. When the braking surface of a brake drum exceeds the specification limits in taper and/or out-of-round, the drum should be machined to true up the braking surface. Out-of-round as well as taper and wear can be accurately measured with an inside micrometer fitted with proper extension rods.

When measuring a drum for out-of-round, taper and wear, take measurements at the open and closed edges of machined surface and at right angles to each other.

MACHINING THE DRUM
If a drum is to be machined, only enough metal should be removed to obtain a true, smooth braking surface. If a drum does not clean-up when machined to a maximum diameter, it must be replaced. Refer to “Specifications” in this section. Removal of more metal will affect dissipation of heat and may cause distortion of the drum.

All brake drums have a maximum diameter cast into them. This diameter is the maximum wear diameter. Do not machine a brake drum that will not meet the specification. Refer to “Specifications” in this section.

BRAKE ADJUSTMENT
A manual adjustment of the rear brakes is required after the rear linings have been replaced. The front disc brakes require no adjustment.

CAUTION: Refer to “Caution” on page 5A2-1 of this section.

1. Remove the lanced area in the brake backing plate.
   • The metal lanced area must be removed from the brake assembly.

Adjust
• Brake adjusting screw until the wheel can just be turned by hand.
• The brake drag should be equal at both wheels.
• Back off the adjusting screw 33 notches.

Important
• Brakes should have no drag after the screw has been backed off about 15 notches. If a heavy drag is present refer to “Parking Brake Adjustment” in HYDRAULIC BRAKES (SEC. 5A).

2. Install an adjusting hole cover in the brake backing plate.
3. Check parking brake adjustment.

### GENERAL INFORMATION

Following are brief outlines of the information contained in Section 6. Use them as a guide to help locate information more quickly.

### SECTION 6A ENGINE

This section contains information common to all engines, including:
- Use of gasket sealers.
- Diagnosis (for engine mechanical).
- Compression check procedure.

### SECTIONS 6A3 THROUGH 6A7

4.3L V6, SMALL BLOCK, 7.4L V8, 6.2L DIESEL, 4.8L L6

These sections contain information for "on-vehicle" servicing of the basic engine, such as manifold, cylinder head, camshaft, and piston replacement.

Detailed repair information on components such as oil pump, cylinder head, etc. is not included. Refer to the "Light Duty Truck Unit Repair Manual" for this information.

### SECTION 6B1 ENGINE COOLING

This section has information on cooling system components, including:
- Diagnosis
- Water Pump
- Fan and Fan Clutch
- Auxiliary Fan
- Belts
- Thermostat

### SECTION 6B2 RADIATORS

This section contains information on radiators and shrouds, including aluminum radiator repair procedures.

### SECTION 6C FUEL SYSTEM

This section contains information on fuel system components, including:
- Accelerator controls
- Fuel tanks
- Air cleaners
- Fuel filters (carbureted vehicles)
- Fuel pump (carbureted vehicles)
- Fuel tank sending unit (carbureted vehicles)
6-2 ENGINE

• For fuel filter, pump, and sending unit information on TBI equipped vehicles, refer to the “Fuel and Emissions Service Manual.”

SECTION 6C1
CARBURETORS

This section contains information for carburetor “on-vehicle” service and adjustments. For overhaul information, refer to the “Light Duty Truck Unit Repair Manual.”

SECTION 6C2
DIESEL FUEL INJECTION

This section contains information on the fuel injection system used on 6.2L diesel engines, including:
• Timing adjustment and other adjustment procedures.
• Injection nozzle replacement and testing.
• Injection pump replacement and repairs.

SECTION 6D
ENGINE ELECTRICAL

This section contains information on electrical components associated with engine operation, including:
• Spark plug wires
• Block heaters
• Battery
• Glow plug system
• Starters
• Generators
• Distributors.

"On-vehicle" service procedures are given. For overhaul information, refer to the “Light Duty Truck Unit Repair Manual.”

SECTION 6E AND 6E8
EMISSIONS AND DRIVEABILITY AND EMISSIONS (CARBURATED)

This section contains information on the emissions systems on carbureted engines, including diagnosis and component replacement. For information on TBI emissions systems, refer to the “Fuel and Emissions Service Manual.”

SECTION 6E9
DRIVEABILITY AND EMISSIONS (DIESEL)

This section contains information on the emissions systems of 6.2L diesel engines, including component repair. Driveability diagnosis can be found in ENGINE (SEC. 6A).

SECTION 6F
EXHAUST

This section contains information on the exhaust system, including component replacement.

SECTION 6H
VACUUM PUMPS

This section contains information on vacuum pumps, including replacement procedures and diagnosis.
GENERAL INFORMATION

STATEMENT ON CLEANLINESS AND CARE

• An engine is a combination of many machined, honed, polished and lapped surfaces with very fine tolerances.

• Whenever valve train components, cylinder head, cylinder, crankshaft, or connecting rod components are removed for service, they should be retained in order. At the time of installation, they should be installed in the same locations and with the same mating surfaces as when removed.

• Any time air cleaner, carburetor, or TBI unit is removed, the intake opening must be covered. If a diesel engine is being serviced, the recommended cover (J-29664-2 or J-26996-1) should be used. This will protect against the entrance of foreign material which could follow the intake passage into the cylinder and cause extensive damage when the engine is started.

• When any internal engine parts are serviced, care and cleanliness are important. A liberal coating of engine oil should be applied to friction areas during assembly to protect and lubricate the surfaces on initial operation. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard shop practice even if not specifically stated.

• On diesel engines, whenever the fuel injection pump or lines are removed or disconnected, care must be taken to prevent the entry of dirt into the pump, lines, and injectors. The entry of even small amounts of dirt or other foreign material into the fuel injection system may cause serious damage.

• It should be kept in mind, while working on the engine, that the 12-volt electrical system is capable of violent and damaging short circuits. When performing any work where electrical terminals could possibly be grounded, the ground cable of the battery should be disconnected at the battery.

• Battery cables should be disconnected before any major work is performed on the engine. Failure to disconnect cables may result in damage to wire harness or other electrical parts.

• Cover or otherwise protect exposed electrical connections to prevent damage from oil and fuel.

• When raising or supporting the engine for any reason, do not use a jack under the oil pan. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen resulting in a damaged oil pickup unit.
TUNE-UP INFORMATION

All information required to tune up the vehicle's engine is given in the Engine Emission Control Label. This label is located in the engine compartment. Information that can be found on the label includes:

• Spark plug type and gap.
• Ignition timing.
• Valve lash (if applicable).
• Idle, fast idle, and solenoid screw speeds, as applicable.
• The proper sequence for making the adjustments.
• Emission hose routing diagram (sometimes on a separate label).

USE OF RTV SEALER AND ANAEROBIC GASKET ELIMINATOR

Two types of sealer are commonly used in engines covered by this manual. These are RTV sealer and anaerobic "gasket eliminator" sealer.

It is important that these sealers be applied properly and in the proper place to prevent oil leaks. THE TWO TYPES OF SEALER ARE NOT INTERCHANGEABLE. Use the sealer recommended in the procedure.

• RTV (room temperature vulcanizing) sealer is used where a non-rigid part is assembled to a rigid part. Common examples are oil pans and rocker arm covers.
• Anaerobic gasket eliminator hardens in the absence of air. This sealer is used where two rigid parts (such as castings) are assembled together. When two rigid parts are disassembled and no sealer or gasket is readily noticeable, the parts were probably assembled using gasket eliminator.

USING RTV SEALER

1. Don't use RTV when extreme temperatures are expected, such as exhaust manifold, head gasket or where gasket eliminator is specified.

2. When separating components sealed with RTV, use a rubber mallet and "bump" the part sideways to shear the RTV sealer. "Bumping" should be done at bends or reinforced areas to prevent distortion of parts. RTV is weaker in shear (lateral) strength than in tensile (vertical) strength.

   Attempting to pry or pull components apart may result in damage to the part.

3. Surfaces to be resealed must be clean and dry. Remove all traces of oil and RTV. Clean with a chlorinated solvent such as carburetor spray cleaner. Don't use petroleum cleaners such as mineral spirits; they leave a film onto which RTV won't stick.

4. Apply RTV to one of the clean surfaces. Use a bead size as specified in the procedure. Run the bead to the inside of any bolt holes. Do not allow the sealer in any blind threaded holes, as it may prevent the bolt from seating properly or cause damage when the bolt is tightened.

5. Assemble while RTV is still wet (within 3 minutes). Don't wait for RTV to skin over.

6. Torque bolts to specifications. Don't over-torque.

USING ANAEROBIC GASKET ELIMINATOR

1. Clean surfaces to be resealed with a chlorinated solvent to remove all oil, grease and old material.

2. Apply a continuous bead of gasket eliminator to one flange.

3. Spread bead evenly with your finger to get a uniform coating on the complete flange.

4. Assemble parts in the normal manner and torque to specifications.

REPLACING ENGINE GASKETS

CAUTION: Composite type gaskets are used in some areas of the engine assembly. These gaskets have a thin metal core. Use caution when removing or handling composite gaskets to help avoid personal injury.

GASOLINE ENGINE MECHANICAL DIAGNOSIS

The following information pertains to the basic assembly only. For more diagnosis information, refer to the following:

• Overheating or other cooling system problems: Refer to COOLING (SEC. 6B).

• Cranking and ignition system problems: Refer to ENGINE ELECTRICAL (SEC. 6D).

• Starting, driveability, fuel economy, etc. problems: Refer to DRIVEABILITY AND EMISSIONS (SEC. 6E) for carbureted engines, or to the "Fuel and Emissions Service Manual" for TBI engines.

### GASOLINE ENGINE COMPRESSION CHECK

1. Disconnect the primary lead from the distributor or ignition coil. Refer to ENGINE ELECTRICAL (SEC. 6D).
2. Remove all spark plugs.
3. Block the throttle plate and choke plate (if used) wide open.
4. Make sure the battery is fully charged.
5. Starting with the compression gage at zero, crank the engine through four compression strokes (four "puffs").
6. Make the compression check at each cylinder and record each reading.
7. If some cylinders have low compression, inject about 15 ml. (one tablespoon or about 3 squirts from a pump type oil can) of engine oil into the combustion chamber through the spark plug hole.
8. Minimum compression recorded in any one cylinder should not be less than 70 per cent of highest cylinder, and no cylinder should read less than 690 kPa (100 psi). For example, if the highest pressure in any one cylinder is 1035 kPa (150 psi), the lowest allowable pressure for any other cylinder would be 725 kPa (105 psi). (1035 x 70% = 725) (150 x 70% = 105).
   - Normal — Compression builds up quickly and evenly to specified compression on each cylinder.
   - Piston Rings Leaking — compression low on first stroke tends to build up on following strokes but does not reach normal. Improves considerably with addition of oil.
   - Valves Leaking — Low on first stroke. Does not tend to build up on following strokes. Does not improve much with addition of oil.
   - If two adjacent cylinders have lower than normal compression, and injecting oil into cylinders does not increase the compression, the cause may be a head gasket leak between the cylinders.
### Diagnosis of Hydraulic Lifters

<tr>
<td>Momentarily Noisy When Engine Is Started</td>
<td>This condition is normal. Oil drains from the lifters which are holding the valves open when the engine is not running. It will take a few seconds for the lifter to fill after the engine is started.</td>
<td>None needed.</td>
</tr>
</tbody>
</table>
| Intermittently Noisy On Idle Only, Disappearing When Engine Speed Is Increased | 1. Dirt in hydraulic lifter.  
2. Pitted or damaged check ball. | 1. Disassemble and clean.  
2. Replace the hydraulic lifter. |
| Noisy At Slow Idle Or With Hot Oil; Quiet At Higher Engine Speeds Or With Cold Oil | High leak down rate. | Replace the hydraulic lifter. |
| Noisy At High Vehicle Speeds, Quiet At Low Speeds | 1. High oil level — Oil level above the “Full” mark allows crankshaft counterweights to churn the oil into foam. When foam is pumped into the lifters, they will become noisy since a solid column of oil is required for proper operation.  
2. Low oil level — Oil level below the “Add” mark allows the oil pump to pump air at high speeds which results in noisy lifters.  
3. Oil pan bent against oil pump pickup screen.  
4. Oil pump screen bent or loose. | 1. Drain oil to proper level.  
2. Add oil as needed.  
3. Repair.  
4. Repair. |
| Noisy At Idle, Becoming Louder As Engine Speed Is Increased To 1500 RPM | 1. This noise is not connected with lifter malfunction. It becomes most noticeable in the vehicle at 10 to 15 mph “L” (Low) range, or 30 to 35 mph “D” (Drive) range and is best described as a “hashy” sound. At slow idle, it may be entirely gone or appear as a light ticking noise in one or more valves. It is caused by one or more of the following:  
• Badly worn or scuffed valve tip and rocker arm pad.  
• Excessive valve stem to guide clearance.  
• Excessive valve seat runout.  
• Off square valve spring.  
• Excessive valve face runout.  
• Valve spring damper clicking on rotator. | 1. Repair as necessary. |

| **Noisy Regardless Of Engine Speed** | 1. Incorrect valve adjustment (excessive lash) (engines with adjustable valve lash).  
2. Excessive valve lash. Check for valve lash by turning the engine so the piston in that cylinder is on TDC of the firing stroke. If valve lash is present, the pushrod can be freely moved up and down a certain amount with rocker arm held against valve. Excessive lash can be caused by:  
a. Worn pushrod upper end ball.  
b. Bent pushrod.  
c. Improper lubrication of the pushrod.

## Most Likely/Possible Causes

### X = Most Likely Causes

### = Possible Causes

### Mechanical/Maintenance
- Gasket blow-by or seal leakage
- Faulty damper/ flywheel balance
- Valve leakage
- Broken, scored or worn pistons/rings
- Incorrect main or rod bearing clearance
- Damaged crankshaft or main/rod bearings
- Damaged worn camshaft lobes
- Faulty lifter or guide plate
- Faulty pushrod or rocker arm
- Worn or misaligned timing gears, chain or key(s)
- Low cylinder compression (180 PSI min.)
- Oil change interval
- External injection pump throttle linkage
- Timing retarded
- Timing advanced
- Starter cranking speed/batteries (180 RPM min.)
- Engine mounts/bolts or fuel line/oil fill tube clamps
- Long idle periods
- Cracked cylinder head or wall
- Missing prechambers
- Engine overloaded/excessive speed
- Improper starting procedures
- Debris/fuel in cylinders

### Electrical/Emissions
- Inoperative glow plugs
- Faulty glow plug controller/P wire grounds
- Faulty alternator diode/starter motor wire connections
- Inoperative glow plug controller/relay
- Shorted or open glow plug inhibitor switch
- No voltage to controller (key on)
- EGR valve stuck open
- EPR valve stuck closed
- Faulty EGR/ EPR solenoids
- MISadjusted or faulty EGR/ EPR throttle position switch
- Housing pressure cold advance solenoid or switch
- Faulty crankcase depression regulator (CDR) valve
- Crankcase depression system hose connections
- Misadjusted or faulty vacuum regulator valve
- Transmission converter does not apply
- Faulty vacuum pump (21" Hg min.)
- Faulty engine speed sensor

### Air System
- Restricted air intake ducting or manifold
- High exhaust back pressure
- Thin air in hot weather or high altitude
- Plugged air filter
- Low ambient temperature
- High ambient temperature

6A-10 ENGINE

COMPRESSION CHECK
(6.2L DIESEL ENGINE)

Tools Required:
J-29664-2 or J-26996-1 Intake Manifold Cover
J-26999-10 Compression Gage Adapter

1. Remove the air cleaner. Install J-29664-2 or J-26996-1 over the mouth of the intake manifold.
2. Disconnect the wire from the fuel solenoid terminal of the injection pump.
3. Disconnect wires from glow plugs then remove all glow plugs.
4. Screw J-26999-10 into the glow plug hole of the cylinder that is being checked. Connect to a suitable compression gage (figure 1).
5. Make sure the batteries are fully charged, and the engine is fully warmed up (engine oil hot).
6. Crank the engine. Allow six “puffs” per cylinder.
7. Make the compression check at each cylinder and record the readings.

NOTICE: Do not add oil to any cylinder during a compression test as extensive engine damage can result.

8. The lowest reading cylinder should not be less than 80 percent of the highest reading cylinder. No cylinder should read less than 2625 kPa (380 psi).
   • Normal: Compression builds up quickly and evenly to specified compression on each cylinder. Reading should be in the 2625-2760 kPa (380-400 psi) range.
   • Leaking: Compression low on first stroke tends to build up on following strokes but does not reach normal.

CRANKING SPEED CHECK
(6.2L DIESEL ENGINE)

Tool Required:
J-26999-10 Compression Gage

Cranking speed is critical for a diesel to start, either hot or cold. Some tachometers are not accurate at cranking speed. An alternate method of checking cranking speed or determining the accuracy of a tachometer follows:

2. Disconnect the injection pump fuel solenoid lead on the top of the injection pump.
3. Install the digital tachometer to be checked (if desired).
4. Depress the pressure release valve on the compression gage.
5. With the aid of an assistant, crank the engine for 2 or 3 seconds to allow the starter to reach full speed, then without stopping, count the number of “puffs” at the compression gage that occur in the next 10 seconds. Multiply the number of “puffs” in the 10 second period by 12 and the resulting number will be the cranking speed in revolutions per minute (RPM).

Example:
10 seconds = 1/6 of a minute
1 puff = 2 RPM
RPM = No. of puffs x 2 x 6 or
RPM = No. of puffs x 12

Minimum cranking speed on the 6.2L diesel engine is 100 RPM cold and 180 RPM hot. The actual cranking speed needed will vary depending on the condition of the engine (compression) and nozzles.

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology "NOTICE: See 'Notice' on page 6A3-1 of this section."

NOTICE: All engine fasteners are important attaching parts in that they could affect the performance of vital components and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of this part.

DESCRIPTION

4.3L engines are 90-degree V6 type, overhead valve, water cooled, with cast iron block and heads.

The crankshaft is supported by four precision insert main bearings, with crankshaft thrust taken at the number four (rear) bearing.

The camshaft is supported by four plain type bearings and is chain driven. Motion from the camshaft is transmitted to the valves by hydraulic lifters, pushrods, and ball type rocker arms. The valve guides are integral in the cylinder head.

The connecting rods are forged steel, with precision insert type crankpin bearings. The piston pins are a press fit in the connecting rods.

The pistons are cast aluminum alloy. The piston pins are a floating fit in the piston.

ENGINE LUBRICATION

Lubrication schematics are shown in figures 1 and 2. The gear type oil pump is driven from the distributor shaft, which is gear driven from the camshaft. Oil is drawn into the oil pump through a pickup screen and pipe.

Pressurized oil is routed to the oil filter. In case of excessive oil pressure, a bypass valve is provided. Filtered oil flows into the main gallery and then to the camshaft and crankshaft bearings. The valve lifter oil gallery supplies oil to the valve lifters. Oil flows from the hydraulic lifters through the hollow pushrods to the rocker arms. Oil from the overhead drains back to the crankcase through oil drain holes.

The timing chain is drip fed from the front camshaft bearing. The pistons and piston pins are lubricated by oil splash.

ROCKER ARM COVER REPLACEMENT

REMOVAL — RIGHT SIDE

Remove or Disconnect (Figure 3)

1. Battery negative cable.
2. Engine cover (G models).
3. Air cleaner and heat stove tube.
4. Diverter valve, bracket and hoses (G models).
5. Spark plug wire bracket at the side of the cylinder head (G models).
6. Spark plug wires and clip at the rear of the cylinder head (G models).
7. Wiring harnesses at the rocker arm cover. Move out of the way.
8. Rocker arm cover bolts.
9. Rocker arm cover and gasket.

REMOVAL — LEFT SIDE

Remove or Disconnect (Figure 3)

1. Battery negative cable.
2. Engine cover (G models).
3. Oil fill tube (G models).
4. AIR pipe and check valve (G models).
5. Generator rear bracket (G models).
6. Air conditioning compressor, and lay aside (R and V models).

CLEANING AND INSPECTION

Clean

• All traces of old gasket from the rocker arm cover and cylinder head.

Inspect

• Rocker arm cover sealing surface for distortion and damage. Replace if necessary.

INSTALLATION — RIGHT SIDE

Install or Connect (Figure 3)

1. Rocker arm cover and gasket.
2. Rocker arm cover bolts and washers.

Tighten

• Rocker arm cover bolts to 11.3 N·m (100 in. lbs.).
3. Wiring harness to the rocker cover.
4. Spark plug wires, clips, and brackets (G models).
5. Diverter valve, hoses, and bracket (G models).
6. Air cleaner and heat stove tube.
7. Engine cover (G models).
8. Battery negative cable.

INSTALLATION — LEFT SIDE

Install or Connect (Figure 3)

1. Rocker arm cover and gasket.
2. Rocker arm cover bolts and washers.

Tighten

• Rocker arm cover bolts to 11.3 N·m (100 in. lbs.).
3. Crankcase ventilation pipe.
4. Power brake vacuum pipe (R and V models).
5. Air conditioning compressor (R and V models).
6. Generator rear bracket (G models).
7. AIR pipe and check valve (G models).
8. Oil fill tube (G models).
9. Engine cover (G models).
10. Battery negative cable.

ROCKER ARM AND PUSHROD REPLACEMENT

Remove or Disconnect

1. Rocker arm cover, as outlined previously.
2. Rocker arm nut.

• If only the pushrod is to be replaced, back the rocker arm nut off until the rocker arm can be swung away from the pushrod. Then pull the pushrod out.
3. Rocker arm with ball.
4. Pushrod.
Important
- Store used components in order so they can be reassembled in the same location.

Inspect
- Rocker arms and balls at their mating surfaces. These surfaces should be smooth and free from scoring or other damage.
- Rocker arm areas which contact the valve stems and the sockets which contact the pushrods. These areas should be smooth and free of damage and wear.
- Pushrods for bending. Roll the pushrod on a flat surface to determine if it is bent. Replace if necessary.
- Ends of the pushrods for scoring or roughness.

Install or Connect
1. Pushrod. Make sure the pushrod seats properly in the hydraulic lifter.
2. Rocker arm with ball.
   • When new rocker arms and/or balls are installed, coat their bearing surfaces with "Molykote" or equivalent.
3. Rocker arm nuts.
4. Rocker arm cover, as outlined previously.

Adjust
• Valves as outlined later.

VALVE ADJUSTMENT
1. Remove the rocker arm cover as outlined previously.
2. Crank the engine until the mark on the torsional damper lines up with the "O" mark on the timing tab and the engine in the number one firing position. This may be determined by placing fingers on the number one valve as the mark on the damper comes near the "O" mark on the timing tab. If the rocker arms are not moving, the engine is in the number one firing position. If the rocker arms move as the mark comes up to the timing tab, the engine is in the number four firing position and should be turned over one more time to reach the number one position.
3. With the engine in the number one firing position as determined above, the following valves may be adjusted:
   - Exhaust: 1, 5, 6.
   - Intake: 1, 2, 3.
   (Even numbered cylinders are in the right bank; odd numbered cylinders are in the left bank, when viewed from the rear of the engine).
4. Back out the adjusting nut until lash is felt at the pushrod then turn in the adjusting nut until all lash is removed. This can be determined by rotating the pushrod while turning the adjusting nut (figure 4). When the play has been removed, turn the adjusting nut in one full additional turn (to center the lifter plunger).
5. Crank the engine one revolution until the timing tab "O" mark and vibration damper mark are again in alignment. This is the number four firing position. The following valves may be adjusted:

   - Exhaust: 2, 3, 4.
   - Intake: 4, 5, 6.

6. Install the rocker arm cover as outlined previously.

VALVE STEM SEAL AND VALVE SPRING REPLACEMENT

Remove or Disconnect (Figures 5 and 6)

Tools Required:
- J-23590 Air Adapter.
- J-5892-B Spring Compressor.
1. Rocker arm cover, as outlined previously.
2. Rocker arms, as outlined previously.
4. Valve keepers (20).
   • Install J-23590 into the spark plug hole.
   • Apply compressed air to hold the valves in place.
   • Install a rocker arm nut (figure 6).
4.3 LITER V6 6A3-7

Install or Connect (Figures 5, 6, and 7)

Tools Required:
J-23590 Air Adapter.
J-5892-B Spring Compressor.
J-23994-01 Adapter Cup.
J-23738-A Vacuum Pump.
1. New seal (24) (intake valve only). Install the seal over the intake valve stem and seat it against the head.
2. Spring (26) with damper (25), shield (22) and cap (21) and/or rotator (28).
3. New O-ring seal (23) and valve keepers (20).
   • With air pressure applied to the cylinder with J-23590, compress the spring with J-5892-B (figure 6).
   • Lubricate the O-ring seal with engine oil. Install the seal on the valve stem. Make sure the seal is not twisted.
   • Install the valve keepers. Use grease to hold them in place.
   • Carefully release spring pressure. Make sure the valve keepers stay in place.
   • Remove J-5892-B and J-23590.
   • Check each O-ring seal for leakage (figure 7).
     • Place the suction cup furnished with J-23738-A over the shield.
     • Connect J-23738-A to the suction cup and apply a vacuum. Watch the vacuum pump gage. No air should be able to leak past the seal. If the seal will not hold a vacuum, it may have been damaged or improperly installed.
4. Spark plugs.
5. Rocker arms, as outlined previously.

Adjust
• Valves, as outlined previously.
6. Rocker arm cover, as outlined previously.

INTAKE MANIFOLD RE Replacement

Remove or Disconnect
1. Battery negative cable.
2. Engine cover (G models).
3. Air cleaner and heat stove tube.
   • Drain the cooling system.
4. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
5. Accelerator, cruise control, and TVS cables and bracket.
6. Cruise control transducer, if equipped.
7. Air conditioning compressor, and lay aside (G models).
8. Air conditioning compressor rear brackets at the manifold (R and V models).
9. Generator bracket at the manifold.
10. Idler pulley bracket at the manifold (G models).
11. Fuel and vacuum lines and electrical connections at the TBI unit and manifold.
13. Upper radiator hose.
15. Coil wires.
16. EGR vacuum line.
17. Sensors with bracket on right side.
19. Transmission dipstick tube (if equipped) (G models).
20. Intake manifold bolts.
21. Intake manifold and gaskets.

Clean
- Old gasket and RTV from the block, heads, and intake manifold. Remove all RTV that is loose or will cause interference at assembly.
- Excessive carbon deposits from the exhaust and EGR passages.
- Excessive scale and deposits from the coolant passages.

Inspect
- Manifold for cracks and gasket surface damage.

Install or Connect (Figures 8 and 9)
1. Gaskets to the cylinder head.
2. RTV to the front and rear sealing surfaces on the block (figure 8). Apply a 5 mm (3/32-inch) bead of RTV (part number 1052366 or equivalent) to the front and rear of the block as shown. Extend the bead 13 mm (1/2-inch) up each cylinder head to seal and retain the gaskets.
3. Intake manifold to the engine.
4. Intake manifold bolts.

Tighten
- Intake manifold bolts to 48 N·m (35 ft. lbs.). Use the tightening sequence shown in figure 9.

- Transmission dipstick tube (if equipped) (G models).
- Wiring harness.
- Sensors with bracket.
- EGR vacuum line.
- Coil wires.
- Power brake vacuum pump.
- Upper radiator hose.
- Heater pipe.
- Fuel and vacuum lines and electrical connections at the TBI and manifold.
- Idler pulley bracket (G models).

16. Air conditioning compressor rear brackets (R and V models).
17. Air conditioning compressor (G models).
18. Cruise control transducer, if equipped.
19. Accelerator, cruise control, and TVS cables and bracket.
20. Distributor. Refer to ENGINE ELECTRICAL (SEC. 8D).
22. Engine cover (G models).
23. Battery negative cable.

• Fill the cooling system with the proper coolant.

HYDRAULIC LIFTER REPLACEMENT

Remove or Disconnect (Figures 10)

1. Rocker arm cover, intake manifold, and pushrods, as outlined previously.
2. Bolts (40).
3. Retainer (41) with restrictors (46).
   • Remove the hydraulic lifters one at a time and place them in an organizer rack. The lifters must be installed in the same bore from which they were removed.

Inspect

• Hydraulic lifter body for scuffing or scoring. If the lifter body wall is worn or damaged, the mating bore in the block should also be checked.

Install or Connect (Figure 10)

1. Hydraulic lifters to the block. Lubricate the lifter roller and body with Engine Oil Supplement or equivalent.

Important

• When any new hydraulic lifters or a new camshaft is installed, change the engine oil and filter. Engine Oil Supplement (or equivalent) should be added to the engine oil.
• Replace all hydraulic lifters when a new camshaft is installed.

2. Retainer (41) with restrictors (46).
3. Bolts (40).

Tighten

• Bolts (40) to 16.4 N·m (145 in. lbs.).

4. Intake manifold, as outlined previously.
5. Pushrod, as outlined previously.
Adjust

Valves, as outlined previously.

6. Rocker arm cover, as outlined previously.

ROCKER ARM STUD REPLACEMENT

Remove or Disconnect (Figure 11)

Tool Required:

J-5802-01 Rocker Arm Stud Remover.

1. Rocker arm cover and rocker arm, as outlined previously.

2. Rocker arm stud.
   - Place J-5802-01 over the rocker arm stud.
   - Install a nut and flat washer.
   - Turn the nut to remove the stud (figure 11).

Install or Connect (Figures 12 and 13)

Tools Required:

J-5715 Reamer (0.003-inch oversize) or
J-6036 Reamer (0.013-inch oversize).

J-6880 Rocker Arm Stud Installer.

NOTICE: Do not attempt to install an oversize rocker arm stud without reaming the stud hole as this could damage the cylinder head.

- Ream the hole to the proper size for the replacement oversize rocker arm stud. Use J-5715 for 0.003-inch oversize studs; J-6036 for 0.013-inch oversize stud (figure 12).
- Coat the lower end (press-fit area) of the rocker arm stud with hypoid axle lubricant.

1. Rocker arm stud. Use J-6880 (figure 13). Stud is installed to proper depth when the tool bottoms on the cylinder head.

2. Rocker arm, as outlined previously.

Adjust

Valves, as outlined previously.

3. Rocker arm cover, as outlined previously.
EXHAUST MANIFOLD REPLACEMENT

Remove or Disconnect (Figure 14)
1. Battery negative cable.
2. Engine cover (G models).
   • Raise the vehicle. Support with suitable safety stands.
3. Exhaust pipe at the manifold.
   • Lower the vehicle.
4. Oxygen sensor wire (left side manifold). Do not remove the oxygen sensor from the manifold unless it is to be replaced.
5. Air conditioning compressor rear bracket at the manifold, if equipped (R and V models - left side manifold).
6. Power steering pump bracket at the manifold (G models - left side manifold).
7. Heat stove pipe (right side manifold).
8. AIR pipe at the diverter valve (R and V models - right side manifold).
9. Diverter valve bracket (R and V models - right side manifold).
10. Dipstick tube bracket at the manifold (G models — right side manifold).
11. AIR hose at the check valve.
12. Exhaust manifold bolts, washers, heat shield (left side manifold), and tab washers.

Clean
— Mating surfaces on the manifold and head.
— Threads on the exhaust manifold bolts.

Install or Connect (Figure 14)
1. Exhaust manifold, bolts, washers, heat shield (left side manifold), and tab washers.

Tighten
• Bolts on center exhaust tube to 36 N-m (26 ft. lbs.).
• Bolts on front and rear exhaust tubes to 28 N-m (20 ft. lbs.).
• Bend the tab washers over the heads of all bolts.
2. AIR hose at the check valve.
3. Dipstick tube bracket at the manifold (G models – right side manifold).
4. Diverter valve bracket (R and V models – right side manifold).
5. AIR pipe at the diverter valve (R and V models – right side manifold).
6. Heat stove tube (right side manifold).
7. Power steering pump bracket at the manifold (G models – left side manifold).
8. Air conditioning compressor rear bracket, if equipped (R and V models – left side manifold).
9. Oxygen sensor wire (left side manifold).
• Raise the vehicle. Support with suitable safety stands.
10. Exhaust pipe to the manifold.
• Lower the vehicle.
11. Engine cover (G models).
12. Battery negative cable.

CYLINDER HEAD REPLACEMENT

REMOVAL — R AND V MODELS

++ Remove or Disconnect

1. Battery negative cable.
2. Intake manifold, as outlined previously.
3. Exhaust manifold, as described previously.
4. AIR pipe at the rear of the head.
5. Generator mounting bolt at the cylinder head (right cylinder head).
6. Power steering pump and brackets from the cylinder head, and lay aside (left cylinder head).
7. Air conditioning compressor and brackets, and lay aside (left cylinder head).
8. Rocker arm cover, as outlined previously.
9. Spark plug wires at the brackets.
10. Coolant sensor wire (left cylinder head).
11. Cruise control transducer bracket (left cylinder head).
12. Dipstick tube at the cylinder head, and move aside (right cylinder head).
14. Pushrods, as outlined previously.
15. Cylinder head bolts.
17. Gasket.

CLEANING, INSPECTION, AND REPAIR

Clean
— Carbon deposits from combustion chambers.
— All traces of old head gasket from cylinder head and block.
— Cylinder head bolt threads and threads in the block.

Inspect
• Sealing surfaces of the block and cylinder head for nicks, heavy scratches, or other damage.

Cylinder Head Repair
• Refer to the proper Unit Repair Manual.

INSTALLATION — R AND V MODELS

++ Install or Connect (Figure 15)

1. Head gasket.
   • If a steel gasket is used, coat both sides of the gasket with sealer. Spread the sealer thin and even.
   • Do not use sealer on composition steel-asbestos gaskets.
   • Place the gasket over the block dowel pins with the bead up.
2. Cylinder head. Carefully guide the cylinder head into place over the dowel pins and gasket.
3. Cylinder head bolts. Coat threads of the cylinder head bolts with sealing compound (GM part number 1052080 or equivalent) and install finger-tight.
4.3 LITER V6 6A3-13

**Tighten**

- Cylinder head bolts, a little at a time, using the sequence shown in figure 15. Proper torque is 90 N·m (65 ft. lbs.).
4. Pushrods, as outlined previously.

**Adjust**

- Valves, as outlined previously.
5. Rocker arm cover, as outlined previously.
7. Dipstick tube (right cylinder head).
8. Cruise control transducer bracket (left cylinder head).
9. Coolant sensor wire (left cylinder head).
10. Spark plug wires.
11. Air conditioning compressor and brackets (left cylinder head).
12. Power steering pump and brackets (left cylinder head).
13. Generator mounting bolt (right cylinder head).
14. AIR pipe.
15. Exhaust manifold, as outlined previously.
16. Intake manifold, as outlined previously.
17. Battery negative cable.

**INSTALLATION — G MODELS**

**Install or Connect (Figure 15)**

1. Head gasket.
   - If a steel gasket is used, coat both sides of the gasket with sealer. Spread the sealer thin and even.
   - Do not use sealer on composition steel-asbestos gaskets.
   - Place the gasket over the block dowel pins with the bead up.
2. Cylinder head. Carefully guide the cylinder head into place over the dowel pins and gasket.
3. Cylinder head bolts. Coat threads of the cylinder head bolts with sealing compound (GM part number 1052080 or equivalent) and install finger-tight.

**Tighten**

- Cylinder head bolts, a little at a time, using the sequence shown in figure 15. Proper torque is 90 N·m (65 ft. lbs.).
4. Pushrods, as outlined previously.

**Adjust**

- Valves, as outlined previously.
5. Rocker arm cover, as outlined previously.
7. Dipstick tube (right cylinder head).
8. Cruise control transducer bracket (left cylinder head).
9. Coolant sensor wire (left cylinder head).
10. Spark plug wires.
11. Air conditioning compressor and brackets (left cylinder head).
12. Power steering pump and brackets (left cylinder head).
13. Generator mounting bolt (right cylinder head).
14. AIR pipe.
15. Exhaust manifold, as outlined previously.
16. Intake manifold, as outlined previously.
17. Battery negative cable.

**TORSIONAL DAMPER AND FRONT CRANKSHAFT SEAL REPLACEMENT**

**Remove or Disconnect (Figure 16)**

Tool Required:
- J-23523-E Torsional Damper Puller and Installer.
1. Fan belts, fan, and pulley.
2. Fan shroud assembly.
3. Accessory drive pulley.
4. Torsional damper bolt.
6. Front crankshaft seal. Pry out with a large screwdriver. Take care not to distort the timing cover.
7. Crankshaft key, if necessary.

**Inspect**

- Oil seal contact area on the torsional damper shaft for grooving and roughness. Replace if necessary.

**Install or Connect (Figures 17 and 18)**

Tools Required:
- J-35468 Seal Installer.
- J-23523-E Torsional Damper Puller and Installer.
1. Crankshaft key, if removed.
2. Front crankshaft seal. Use J-35468 (figure 17). The open end of the seal faces inside the engine. Coat the seal lips with engine oil.

**NOTICE:** The inertia weight section of the torsional damper is assembled to the hub with a rubber type material. The correct installation procedures (with the proper tool) must be followed or movement of the inertia weight section of the hub will destroy the tuning of the torsional damper.

3. Stud (item A, figure 18) to the crankshaft. Thread the stud fully into the tapped hole in the crankshaft.
4. Torsional damper over the end of the stud. Align the keyway in the torsional damper shaft with the crankshaft key.

5. Bearing, washer and nut (Figure 18).
   - Turn the nut to pull the vibration damper into place.
   - Remove the tool.
   - Use a small amount of RTV sealant to seal the torsional damper key to crankshaft joint.

6. Torsional damper bolt and washer.
   - Bolt to 95 N·m (70 ft. lbs.).

7. Accessory drive pulley.

8. Fan shroud assembly.

**FRONT COVER REPLACEMENT**

- **Remove or Disconnect**
  1. Torsional damper, as outlined previously.
  2. Water pump. Refer to ENGINE COOLING (SEC. 6B1).
  3. Oil pan, as outlined later.
  4. Front cover bolts.
  5. Front cover.
  6. Front cover to block gasket.
  7. Front crankshaft oil seal from the front cover. Pry out with a screwdriver. Take care not to distort the front cover.

- **Clean**
  - Old gasket from the front cover, and block.

- **Inspect**
  - Front cover for distortion and damage. Replace if necessary.

- **Install or Connect (Figure 19)**
  - Tool Required:
    
  J-35468 Seal Installer.
  1. Front crankshaft oil seal. Use J-35468 (figure 19). The open end of the seal faces inside the engine. Coat the seal lips with engine oil.
  2. Front cover gasket to the front cover. Use gasket cement to hold them in place.
  3. Front cover and bolts.
   - Front cover bolts to 11.3 N·m (100 in. lbs.).
  4. Oil pan, as outlined later.
  5. Water pump.
  6. Torsional damper, as outlined previously.
OIL PAN REPLACEMENT

A one piece type oil pan gasket is used.

Remove or Disconnect (Figure 20)

1. Battery negative cable.
2. Exhaust crossover pipe.
3. Torque converter cover (models with automatic transmission).
4. Strut rods at flywheel cover.
5. Strut rod brackets at the front engine mountings.
7. Strut rods at engine mounts (V models with automatic transmission).
8. Oil pan bolts, nuts, and reinforcements.
9. Oil pan and gasket.

Inspect

- Oil pan gasket for damage. Replace if necessary.

Install or Connect (Figure 20)

- Apply sealant (GM part number 1052080 or equivalent) to the front cover to block joint and to the rear crankshaft seal to block joint. Apply the sealant for about 25 mm (1-inch) in both directions from each of the four corners.

1. Oil pan gasket to the oil pan.
2. Oil pan to the engine.
3. Oil pan bolts, nuts, and reinforcements.

Tighten

- Oil pan bolts to 11.3 N·m (100 in. lbs.).
- Oil pan nuts at corners to 22.6 N·m (200 in. lbs.).
4. Strut rods at the engine mounts (V models with automatic transmission).
5. Starter.
6. Strut rod brackets at the front engine mountings.
7. Strut rods at the flywheel cover.
8. Converter housing under pan (models with automatic transmission).
10. Lower the vehicle.
11. Proper quantity and grade of engine oil.
12. Battery negative cable.

OIL PUMP REPLACEMENT

Remove or Disconnect

1. Oil pan, as outlined previously.
2. Oil pump to main bearing cap bolt.
3. Oil pump.

Inspect

- Oil pump pickup tube for looseness. If the tube is loose in the oil pump body, replace it, as outlined in the proper unit repair manual. A loose pickup tube can result in an air leak and loss of oil pressure.

Oil Pump Repair

- Refer to the proper unit repair manual.

Install or Connect

1. Oil pump to the engine. Align the slot in the oil pump shaft with the tang on the distributor shaft. The oil pump should slide easily into place. No gasket is used.
2. Oil pump to main bearing cap bolt.

Tighten

- Oil pump to main bearing cap bolt to 90 N·m (65 ft. lbs.).
3. Oil pan, as outlined previously.
REAR CRANKSHAFT OIL SEAL REPLACEMENT

Remove or Disconnect (Figure 21)

1. Transmission.
2. Clutch and flywheel or flexplate, as equipped.

NOTICE: Care should be taken when removing the rear crankshaft oil seal so as not to nick the crankshaft sealing surface.

3. Rear crankshaft oil seal. Insert a screwdriver into the notches provided in the seal retainer and pry the seal out (figure 21). Take care not to damage the crankshaft sealing surface.

Inspect
- Chamfer on crankshaft for grit, loose rust, and burrs. Correct as necessary.

Clean
- Seal running surface on the crankshaft with a non-abrasive cleaner.

Install or Connect (Figure 22)

1. Rear crankshaft oil seal (figure 22).
   - Lubricate the inner and outer diameter of the seal with engine oil.
   - Install the seal on J-35621.
   - Position J-35621 against the crankshaft. Thread the attaching screws into the tapped holes in the crankshaft.
   - Tighten the screws securely with a screwdriver. This will ensure that the seal is installed squarely over the crankshaft.
   - Turn the handle until it bottoms.
   - Remove J-35621.
2. Clutch and flywheel or flexplate, as equipped.
3. Transmission.

REAR CRANKSHAFT OIL SEAL RETAINER REPLACEMENT

Remove or Disconnect (Figures 21 and 23)

1. Transmission.
2. Clutch and flywheel or flexplate, as equipped.
3. Oil pan, as outlined previously.
4. Screws (80) and nuts (81).
5. Seal retainer (82).
6. Gasket (84).
7. Rear crankshaft oil seal. Insert a screwdriver into the notches provided in the seal retainer and pry the seal out (figure 21).

Inspect
- Gasket surfaces on block and seal retainer.

Clean
- Gasket surfaces on block and seal retainer.

Install or Connect (Figures 21 and 23)

- Whenever the seal retainer is removed, a new retainer gasket and rear crankshaft oil seal must be installed.

1. Gasket (84) to the block. It is not necessary to use sealant to hold the gasket in place.
2. Seal retainer (82).
3. Screws (80) and nuts (81).

Tighten
- Screws (80) and nuts (81) to 15.3 N.m (135 in. lbs.).
4. Oil pan, as outlined previously.
5. Rear crankshaft oil seal as outlined previously.
6. Clutch and flywheel or flexplate, as equipped.
7. Transmission.
MEASURING CAMSHAFT LOBE LIFT

Tool Required:

J-8520 Camshaft Lobe Lift Indicator.

1. Remove the rocker arm as outlined previously.
2. Refer to figure 24. Position the dial indicator (part of J-8520) so the plunger rests on the pushrod end, as shown. Make sure the pushrod is in the lifter socket.
3. Rotate the crankshaft slowly in the direction of rotation until the lifter is on the heel of the cam lobe. At this point, the pushrod will be in its lowest position.
4. Set dial indicator on zero, then rotate the crankshaft slowly, or attach an auxiliary starter switch and "bump" the engine over, until the pushrod is in fully raised position.

Important

- Whenever the engine is cranked remotely at the starter, with a special jumper cable or other means, the distributor primary lead should be disconnected from the ignition coil.
5. Compare the total lift recorded from the dial indicator with specifications.
6. If camshaft readings for all lobes are within specifications, remove dial indicator assembly.
7. Install the rocker arm and adjust the valves as previously outlined.

CAMSHAFT REPLACEMENT

R AND V MODELS

Remove or Disconnect (Figures 25 through 28)

Tool Required:

J-5825-A Crankshaft Sprocket Puller.

1. Battery negative cable.
2. Air cleaner.
3. Fan, shroud, and radiator. Refer to ENGINE COOLING (SEC. 6B1) and RADIATOR (SEC. 6B2).
4. Generator.
5. Rocker arm covers, as outlined previously.
6. Water pump. Refer to ENGINE COOLING (SEC. 6B1).
7. Torsional damper, as outlined previously.
8. Front cover, as outlined previously.
9. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
10. Intake manifold, as outlined previously.
11. Pushrods and hydraulic lifters, as outlined previously.
   - Align the timing marks (figure 26).
12. Camshaft sprocket bolts.
13. Camshaft sprocket and timing chain. The sprocket is a light interference fit on the camshaft. Tap the sprocket on its lower edge to loosen it.
14. Screws (88) and thrust plate (87).
   - Raise the engine.
17. Camshaft.
• Install two or three 9/16-18 bolts 100-125 mm (4-5 inches) long into the camshaft threaded holes. Use these bolts to handle the camshaft (figure 28).
• Pull the camshaft from the block. Use care to prevent damage to the camshaft bearings.

Cleaning, Inspection And Repair

Clean, inspect and repair or replace the camshaft and related components, as outlined in the proper unit repair manual.

The unit repair manual also describes camshaft bearing replacement.

Install or Connect (Figures 25 through 28, 36, and 37)

Tool Required:
- J-5590 Crankshaft Sprocket Installer.

- Coat the camshaft lobes and journals with a high quality engine oil supplement (GM Engine Oil Supplement or equivalent).
4.3 LITER V6 6A3-19

Figure 28—Replacing the Camshaft

1. Two or three \( \frac{5}{16}-18 \) bolts 100-125 mm (4-5 inches) long into the camshaft threaded holes. Use these bolts to handle the camshaft.

2. Camshaft to the engine (figure 28). Handle the camshaft carefully to prevent damage to the camshaft bearings.
   - Lower the engine.

3. Engine mount through-bolts.
   - Through-bolts or nuts to specifications. Refer to figures 36 and 37.

5. Thrust plate (87) and screws (88).
   - Screws (88) to 11.9 N·m (105 in. lbs.).

6. Camshaft sprocket and timing chain.
   - Install two or three \( \frac{5}{16}-18 \) bolts 100-125 mm (4-5 inches) long into the camshaft tapped holes. Use these bolts to handle the camshaft (figure 28).
   - Pull the camshaft from the block. Use care to prevent damage to the camshaft bearings.

7. Camshaft sprocket bolts.
   - Bolts to 23 N·m (17 ft. lbs.).

Important

- Replace all hydraulic lifters, change the engine oil and filter, and add GM Engine Oil Supplement (or equivalent) to the engine oil whenever a new camshaft is installed.

Adjust

- Valves, as outlined previously.

9. Intake manifold, as outlined previously.

10. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).

11. Front cover, as outlined previously.

12. Torsional damper, as outlined previously.

13. Water pump.

14. Rocker arm covers, as outlined previously.

15. Generator.

16. Fan, shroud, and radiator. Refer to ENGINE COOLING (SEC. 6B1) and RADIATOR (SEC. 6B2).

17. Air cleaner.

18. Battery negative cable.

G MODELS

Remove or Disconnect (Figures 25 through 28)

Tool Required: J-5825-A Crankshaft Sprocket Puller.

1. Battery negative cable.

2. Intake manifold, as outlined previously.

3. Rocker arm covers, as outlined previously.

4. Hydraulic lifters and pushrods, as outlined previously.

5. Outside air duct.

6. Power steering reservoir.

7. Upper fan shroud bolts.

8. Radiator. Refer to RADIATOR (SEC. 6B2).

9. Hood release cable at the latch.

10. Upper fan shroud.

11. Water pump.

12. Torsional damper, as outlined previously.

13. Front cover, as outlined previously.

14. Camshaft sprocket and timing chain. The sprocket is a light interference fit on the camshaft. Tap the sprocket on its lower edge to loosen it.

15. Screws (88) and thrust plate (87).

17. Camshaft.

- Install two or three \( \frac{5}{16}-18 \) bolts 100-125 mm (4-5 inches) long into the camshaft tapped holes. Use these bolts to handle the camshaft (figure 28).

Cleaning, Inspection and Repair

Clean, inspect and repair or replace the camshaft and related components, as outlined in the proper unit repair manual.

The unit repair manual also describes camshaft bearing replacement.

Install or Connect (Figures 25 through 28)

Tool Required: J-5590 Crankshaft Sprocket Installer.
Coat the camshaft lobes and journals with a high quality engine oil supplement (GM Engine Oil Supplement or equivalent).

1. Two or three \( \frac{3}{8} \)-inch bolts 100-125 mm (4-5 inches) long into the camshaft threaded holes. Use these bolts to handle the camshaft.

2. Camshaft to the engine (figure 28). Handle the camshaft carefully to prevent damage to the camshaft bearings.

4. Thrust plate (87) and screws (88).

**Tighten**
- Screws (88) to 11.9 N·m (105 in. lbs.).

5. Camshaft sprocket and timing chain.

**Important**
- Line up the timing marks on the camshaft sprocket and crankshaft sprocket (figure 26).

6. Camshaft sprocket bolts.

**Tighten**
- Bolts to 23 N·m (17 ft. lbs.).

7. Front cover, as outlined previously.

8. Water pump.

9. Torsional damper, as outlined previously.

10. Front cover, as outlined previously.

11. Upper fan shroud.

15. Outside air ducts.

16. Hydraulic lifters and pushrods, as outlined previously.

**Adjust**
- Valves, as outlined previously.

17. Rocker arm covers, as outlined previously.

18. Intake manifold, as outlined previously.

---

**CONNECTING ROD AND PISTON REPLACEMENT**

**Remove or Disconnect (Figure 29)**

Tool Required:
- J-5239 Guide Set.

1. Cylinder head, as outlined previously.

2. Oil pan, as outlined previously.

3. Oil pump, as outlined previously (if necessary).

4. Ridge or deposits from the upper end of the cylinder bores.
   - Turn the crankshaft until the piston is at BDC.
   - Place a cloth on top of the piston.
   - Perform the cutting operation with a ridge reamer.
   - Turn the crankshaft until the piston is at TDC.
   - Remove the cloth and cuttings.

5. Connecting rod cap. Check the connecting rod and cap for identification marks. Mark the parts if required. The connecting rod and cap must be kept together as mating parts.

6. Connecting rod and piston.
   - Attach J-5239 to the connecting rod bolts (figure 29).
   - Use the long guide rod of J-5239 to push the connecting rod and piston out of the bore.

7. Connecting rod bearing.

**Cleaning, Inspection, And Repair**

Clean, inspect and repair or replace the components as necessary. Measure connecting rod bearing clearance, piston clearance, ring clearances, etc. Refer to the proper unit repair manual.

The unit repair manual contains information on:
- Connecting rod and piston.
- Piston rings.
- Connecting rod and crankpin.
- Cylinder bores.

**Install or Connect (Figures 29 through 32)**

Tools Required:
- J-5239 Connecting Rod Guide Set.
- J-8037 Ring Compressor.

- Make sure the cylinder walls are clean. Lubricate the cylinder wall lightly with engine oil.
- Make sure the piston is installed in the matching cylinder.

1. Connecting rod bearings.
   - Be certain that the bearing inserts are of the proper size.
   - Install the bearing inserts in the connecting rod and connecting rod cap.
4.3 LITER V6 6A3-21

A. Oil Ring Rail Gaps
B. 2nd Compression Ring Gap
C. Notch In Piston
D. Oil Ring Spacer Gap
   (Tang In Hole Or Slot With Arc)
E. Top Compression Ring Gap

Figure 30—Piston Ring End Gap Locations

- Lubricate the bearings with engine oil.

2 Piston and connecting rod to the proper bore.
- With the connecting rod cap removed, install J-5239 onto the connecting rod studs.
- Locate the piston ring end gaps as shown in figure 30. Lubricate the piston and rings with engine oil.
- Without disturbing the ring end gap location, install J-8037 over the piston (figure 31).

Figure 31—Installing the Piston

- The piston must be installed so that the notch in the piston faces the front of the engine (figure 30).
- Place the piston in its matching bore. The connecting rod bearing tang slots must be on the side opposite the camshaft. Using light blows with a hammer handle, tap the piston down into its bore (figure 31). At the same time, from beneath the vehicle guide the connecting rod to the crankpin with J-5239 (figure 29). Hold the ring compressor against the block until all rings have entered the cylinder bore.
- Remove J-5239 from the connecting rod bolts.

Important
- Each connecting rod and bearing cap should be marked, beginning at the front of the engine. Cylinders 1, 3 and 5 are at the left bank and, 2, 4 and 6 are the right bank. The numbers on the connecting rod and bearing cap must be on the same side when installed in the cylinder bore. If a connecting rod is ever transposed from block or cylinder to another, new connecting rod bearings should be fitted and the connecting rod should be numbered to correspond with the new cylinder number.

Measure
- Connecting rod bearing clearance. Refer to the proper unit repair manual.

3. Connecting rod cap and bearing.
4. Connecting rod cap nuts.

Tighten
- Connecting rod cap nuts to 60 N·m (45 ft. lbs.).

Measure
- Connecting rod side clearance. Use a feeler gage between the connecting rod and crankshaft (figure 32). The correct clearance is 0.006-0.014-inch.

5. Oil pump (if removed), as outlined previously.
6A3-22 4.3 LITER V6

6. Oil pan and cylinder head, as outlined previously.

MAIN BEARING REPLACEMENT

**Remove or Disconnect (Figure 33)**

Tool Required:
- J-8080 Main Bearing Remover/Installer.

1. Spark plugs.
2. Oil pan, as outlined previously.
3. Oil pump, as outlined previously.
4. Main bearing caps.
   - Check the main bearing caps for location markings. Mark the caps if necessary. The caps must be returned to their original locations during assembly.
5. Lower main bearing inserts from the main bearing caps.
6. Upper main bearing inserts.
   - Insert J-8080 into the crankshaft oil hole (figure 33).
   - Rotate the crankshaft to "turn" the bearing insert out of the block.

**Cleaning, Inspection, And Repair**

Clean, inspect, and repair or replace the components as required. Refer to the proper unit repair manual. The unit repair manual contains information on:
- Crankshaft.
- Main and connecting rod bearings.

**Install or Connect (Figures 33 and 34)**

Tool Required:
- J-8080 Main Bearing Remover/Installer.

1. Upper main bearing inserts.
   - Insert J-8080 into a crankshaft main bearing oil hole (figure 33).
   - Apply engine oil to inserts of the proper size.
   - Insert the plain end (without the bearing tang) of the insert between the crankshaft and the notched side of the block.
   - Rotate the crankshaft to "roll" the insert into the block.

2. Lower main bearing inserts to the main bearing caps.
   - Make sure the inserts are of the proper size.
   - Apply engine oil to the inserts.

**Measure**

- Crankshaft end play, as follows:
  - Tap the end of the crankshaft first rearward then forward with a lead hammer. This will line up the rear main bearing and crankshaft thrust surfaces.
  - Tighten the rear main bearing cap bolts to 100 N·m (75 ft. lbs.).
  - With the crankshaft forced forward, measure at the front end of the rear main bearing with a feeler gage (figure 34). The proper clearance is 0.002-0.006-inch.
  - If correct end play cannot be obtained, be certain that the correct size rear main bearing has been installed. Production engines may have rear main bearings that are 0.008-inch wider across the thrust faces than standard. Refer to the proper unit repair manual for more information.
4.3 LITER V6 6A3-23

8. Oil pump, as outlined previously.
9. Oil pan, as outlined previously.
10. Spark plugs.

OIL FILTER ADAPTER AND OIL FILTER BYPASS VALVE REPLACEMENT (MODELS WITH ENGINE OIL COOLER)

Remove or Disconnect (Figure 35)
1. Oil filter.

Inspect
- Bypass valve spring and fiber valve for proper operation, cracks, or other damage. If replacement is required, the bypass valve and oil filter adapter must be replaced as an assembly, as outlined following.
2. Oil cooler lines.
3. Bolts (93).
4. Oil filter adapter (92).
5. Gasket (91) and seal (90).

Install or Connect (Figure 33)
1. New gasket (91), new seal (90) and oil filter adapter (92) to the block.
2. Bolts (93).

Tighten
- Bolts (93) to 20 N·m (15 ft. lbs.).

CRANKSHAFT REPLACEMENT
1. Remove the engine, as outlined later.
2. Refer to the proper unit repair manual for crankshaft replacement procedures.

FLYWHEEL REPLACEMENT

Remove or Disconnect
1. Transmission, flywheel housing, and clutch.
2. Flywheel bolts.
3. Flywheel.

Clean
- Mating surfaces of crankshaft and flywheel. Remove any burrs.

Inspect
- Flywheel for burning, scoring, warping, and wear. Replace the flywheel if necessary. Do not machine the flywheel.
- Flywheel ring gear for worn or broken teeth.

Flywheel Ring Gear Replacement
1. Use a torch to heat the gear around the entire circumference, then drive the gear off the flywheel, using care not to damage the flywheel.

NOTICE: Never heat starter gear to red heat as this will change metal structure.

2. Uniformly heat the flywheel gear to temperature which will expand the gear to permit installation. Temperature must not exceed 204°C (400°F).
3. As soon as the gear has been heated, install on the flywheel.

Install or Connect
1. Flywheel.
2. Flywheel bolts.

Tighten
- Flywheel bolts to 100 N·m (75 ft. lbs.).
3. Clutch, flywheel housing, and transmission.

ENGINE MOUNTINGS

NOTICE: Broken or deteriorated mountings can cause misaligned and eventual destruction of certain drive train components. When a single mounting breakage occurs, the remaining mountings are subjected to abnormally high stresses.
INSPECTING ENGINE MOUNTINGS

Front Engine Mountings

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

1. Raise the engine to remove weight from the mountings and to place a slight tension on the rubber cushion. Observe both mountings while raising the engine.
2. Replace the mounting if the following conditions exist:
   - Hard rubber surface covered with heat check cracks.
   - Rubber cushion separated from the metal palate of the mounting.
   - Rubber cushion split through the center.
3. If there is movement between a metal plate of the mounting and its attaching points, lower the engine and tighten the bolts or nuts attaching the mounting to the engine, frame, or bracket.

Rear Mountings

1. Push up and pull down on the transmission tailshaft. Observe the transmission mounting.
2. Replace the mounting if the following conditions exist:
   - Rubber cushion separated from the metal plate of the mounting.
   - Mounting bottomed out (tailshaft can be moved up but not down).
3. If there is relative movement between a metal plate of the mounting and its attaching point, tighten the bolts or nuts attaching the mounting to the transmission or crossmember.

FRONT MOUNTING REPLACEMENT

Remove or Disconnect (Figures 36 and 37)

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

- Support the engine with a suitable jack. Do not load the engine mounting.
1. Engine mounting through-bolt and nut.

NOTICE: Raise the engine only enough for sufficient clearance. Check for interference between the rear of the engine and the dash panel which could cause distributor damage.

- Raise the engine only enough to permit removal of the engine mounting.
2. Mounting assembly bolts, nuts, and washers.

Install or Connect (Figures 36 and 37)

1. Mounting assembly.

NOTICE: See "Notice" on page 6A3-1 of this section.

2. Mounting assembly bolts, nuts, and washers.

Tighten
- Fasteners to specifications. Refer to figures 36 and 37.
3. Engine mount through-bolt and nut. Lower the engine until the bolt can be inserted. Install the nut.

Tighten
- Through-bolt or nut to specifications. Refer to figures 36 and 37.

REAR MOUNTING REPLACEMENT

Remove or Disconnect (Figures 38 and 39)

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

- Support the rear of the engine to relieve the weight on the rear mountings.
1. Mounting to crossmember nut(s) and washer(s).
2. Mounting to transmission bolts and washers.
- Raise the rear of the engine only enough to permit removal of the mounting.

Install or Connect (Figures 38 and 39)

1. Mounting.
- Lower the rear of the engine.
2. Mounting to transmission bolts and washers.

NOTICE: See "Notice" on page 6A3-1 of this section.

3. Mounting to crossmember nut(s) and washer(s).

Tighten
- Fasteners to specifications. Refer to figures 38 and 39.

ENGINE REPLACEMENT

“R” AND “V” MODELS

Remove or Disconnect

1. Battery negative cable.
2. Hood.
- Drain the cooling system.
3. Air cleaner.
4. All accessory drive belts.
5. Fan and water pump pulley.
6. Radiator and shroud. Refer to RADIATOR (SEC. 6B2).
A. Torque Bolt to 95 N·m (70 ft. lbs.). Or, Torque Nut to 70 N·m (50 ft. lbs.).
B. 48 N·m (36 ft. lbs.)
C. Forward
D. 40 N·m (30 ft. lbs.)

7. Heater hoses at the engine.
8. Accelerator cruise control, and detent linkage (if used) from the carburetor.
9. Air conditioning compressor (if used) and lay aside.
10. Power steering pump (if used) and lay aside.
11. Engine wiring harness from the engine.
12. Fuel line.
13. Vacuum lines from the intake manifold.
   • Raise the vehicle. Support with suitable safety stands.
   • Drain the crankcase oil.
14. Exhaust pipes from the manifolds.
15. Strut rods at the engine mountings ("V" models with automatic transmission).
16. Flywheel or torque converter cover.
17. Wiring along oil pan rail.
18. Starter.
20. Converter to flex plate bolts (automatic transmission).
   • Lower the vehicle.
   • Support the transmission.

A. Torque Bolt to 100 N·m (75 ft. lbs.).
Or, Torque Nut to 68 N·m (50 ft. lbs.)
B. 48 N·m (36 ft. lbs.)
C. 40 N·m (30 ft. lbs.)
D. Forward
Install or Connect (Figure 36)

1. Engine to the vehicle.
   - Raise the vehicle. Support with suitable safety stands.

22. Engine mounting to frame bolts.
23. Hood.

**NOTICE:** See "Notice" on page 6A3-1 of this section.

2. Engine mounting to frame bolts.

3. Engine to the vehicle.
   - Raise the vehicle. Support with suitable safety stands.

21. Bell housing to engine bolts. Remove the transmission support.
22. Converter to flex plate bolts.
23. Fuel gage wiring.
25. Wiring along oil pan rail.
26. Flywheel or torque converter cover.
27. Strut rods at the engine mountings (V models with automatic transmission).
28. Exhaust pipes to the manifolds.
   - Lower the vehicle.
29. Vacuum lines to the intake manifold.
30. Fuel line.
31. Engine wiring harness.
32. Power steering pump (if used).
33. Air conditioning compressor (if used).
34. Accelerator, cruise control, and detent linkages.
35. Heater hoses.
36. Radiator and shroud. Refer to RADIATOR (SEC. 6B2).
37. Accessory drive belts.
38. Air cleaner.
39. Hood.
40. Proper quantity and grade of coolant and crankcase oil.
41. Battery negative cable.
"G" MODELS

Remove or Disconnect

1. Battery negative cable.
2. Glove box.
3. Engine cover.
   • Drain the coolant.
4. Outside air duct.
5. Power steering fluid reservoir.
6. Hood release cable.
7. Upper fan shroud bolts.
8. Radiator. Refer to RADIATOR (SEC. 6B2).
10. Fan and pulley.
11. Air cleaner.
12. Cruise control transducer.
13. Vacuum hoses at the intake manifold.
14. Accelerator, cruise control, and TVS cables (if used).
15. TBI unit.
17. Diverter valve.
18. Coolant hose at the intake manifold.
19. PCV valve.
20. Other necessary vacuum hoses and wires.
21. Air conditioning compressor and brace. Refer to AIR CONDITIONING (SEC. 1B).
22. Upper half of engine dipstick tube.
23. Oil filler tube.
25. Accelerator cable at the dipstick tube.
26. Fuel hoses at the fuel pump.
27. Power steering pump.
28. Headlamp bezels and grille.
29. Upper radiator support.
30. Lower fan shroud and filler panel.
31. Hood latch support.
32. Condenser.
   • Raise the vehicle. Support with suitable safety stands.
   • Drain the crankcase.
33. Exhaust pipes at the manifolds.
34. Strut rods at the torque converter or flywheel underpan.
35. Torque converter or flywheel cover.
36. Starter.
37. Flexplate to torque converter bolts (automatic transmissions).
38. Bell housing to engine bolts.
39. Engine mounting through bolts.
   • Lower the vehicle and support the transmission.
40. Engine.

Install or Connect (Figure 37)

1. Engine to the vehicle.
   • Raise the vehicle. Support with suitable safety stands.

NOTICE: See "Notice" on page 6A3-1 of this section.

2. Engine mounting through-bolts.

Tighten

• Through-bolts or nuts to specifications. Refer to figure 37.
3. Bell housing to engine bolts.

SMALL BLOCK

The following “Notice” applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology “NOTICE: See ‘Notice’ on page 6A4-1 of this section.”

NOTICE: All engine fasteners are important attaching parts in that they could affect the performance of vital components and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of this part.

DESCRIPTION

Small block engines covered by this manual are available in two displacements; 5.0L (305 cu. in.) and 5.7L (350 cu. in.).

Small block engines are 90-degree V8 type, overhead valve, water cooled, with cast iron block and heads.

The crankshaft is supported by five precision insert main bearings, with crankshaft thrust taken at the number five (rear) bearing.

The camshaft is supported by five plain type bearings and is chain driven. Motion from the camshaft is transmitted to the valves by hydraulic lifters, pushrods, and ball type rocker arms. The valve guides are integral in the cylinder head.

The connecting rods are forged steel, with precision insert type crankpin bearings. The piston pins are a press fit in the connecting rods.

The pistons are cast aluminum alloy. The piston pins are a floating fit in the piston.

ENGINE LUBRICATION

Lubrication schematics are shown in figures 1 and 2. The gear type oil pump is driven from the distributor shaft, which is gear driven from the camshaft. Oil is drawn into the oil pump through a pickup screen and pipe.

Pressurized oil is routed to the oil filter. In case of excessive oil pressure, a bypass valve is provided. Filtered oil flows into the main gallery and then to the camshaft and crankshaft bearings. The valve lifter oil gallery supplies oil to the valve lifters. Oil flows from the hydraulic lifters through the hollow pushrods to the rocker arms. Oil from the overhead drains back to the crankcase through oil drain holes.

The timing chain is drip fed from the front camshaft bearing. The pistons and piston pins are lubricated by oil splash.

10. Components as follows for left rocker arm cover:
    • Decel valve and bracket (G models).
    • Vacuum pipe from EFE valve.
    • Power brake vacuum pipe, and move aside.
    • Air conditioning compressor rear brace (if equipped).
11. Rocker arm cover nuts, reinforcements, and wire clips.
12. Rocker arm cover and gasket.

CLEANING AND INSPECTION

Clean
• All traces of old gasket from the rocker arm cover and cylinder head.

Inspect
• Rocker arm cover sealing surface for distortion. Replace if necessary.

INSTALLATION — TBI ENGINES

Install or Connect (Figure 3)
1. Rocker arm cover and new gasket.
2. Rocker arm cover bolts and washers.

Tighten
• Bolts to 11.3 N·m (100 in. lbs.).
3. AIR pipe at manifold (G models).
4. Components as follows for left rocker arm cover:
    • Air conditioning compressor (R and V models).
    • Power brake vacuum pipe (R and V models).
    • Oil fill tube (G models).
    • Generator rear brace (G models).
5. Components as follows for right rocker arm cover:

9. Engine cover (G models).
10. Battery negative cable.

INSTALLATION — CARBURETED ENGINES

Install or Connect (Figure 3)
1. Rocker arm cover and new gasket.
2. Reinforcements, wire clips, nuts, and stud (if used).

Tighten
• Nuts to 7.3 N·m (65 in. lbs.).
3. Components as follows for left rocker arm cover:
    • Air conditioning compressor rear brace (if equipped).
    • Power brake vacuum pipe.
    • Vacuum pipe to EFE valve.
    • Decel valve and bracket.
4. Heat stove pipe (right side cover).
5. Oil fill tube (right side cover).
6. AIR check valve.
7. Diverter valve, bracket, and hoses.
8. Wiring harnesses to the rocker arm clips.
10. Air cleaner.
11. Engine cover (G models).
12. Battery negative cable.

ROCKER ARM AND PUSHROD REPLACEMENT

Remove or Disconnect
1. Rocker arm cover, as outlined previously.
2. Rocker arm nut.
   • If only the pushrod is to be replaced, back the rocker arm nut off until the rocker arm can be swung away from the pushrod. Then pull the pushrod out.
3. Rocker arm with ball.
4. Pushrod.

Important
• Store used components in order so they can be reassembled in the same location.

Inspect
— Rocker arms and balls at their mating surfaces. These surfaces should be smooth and free from scoring or other damage.
— Rocker arm areas which contact the valve stems and the sockets which contact the pushrods. These areas should be smooth and free of damage and wear.
— Pushrods for bending. Roll the pushrod on a flat surface to determine if it is bent. Replace if necessary.
— Ends of the pushrods for scoring or roughness.

Install or Connect
1. Pushrod. Make sure the pushrod seats properly in the hydraulic lifter.
2. Rocker arm with ball.

Important
• When new rocker arms and/or balls are installed, coat their bearing surfaces with “Molykote” or equivalent.

3. Rocker arm nut.

Adjust
• Valves as outlined later.
4. Rocker arm cover, as outlined previously.

VALVE ADJUSTMENT

1. Remove the rocker arm cover as outlined previously.
2. Crank the engine until the mark on the vibration damper lines up with the “O” mark on the timing tab and the engine in the number one firing position. This may be determined by placing fingers on the number
one valve as the mark on the damper comes near the "O" mark on the timing tab. If the rocker arms are not moving, the engine is in the number one firing position. If the rocker arms move as the mark comes up to the timing tab, the engine is in the number six firing position and should be turned over one more time to reach the number one position.

3. With the engine in the number one firing position as determined above, the following valves may be adjusted:
   - Exhaust: 1, 3, 4, 8
   - Intake: 1, 2, 5, 7
   (Even numbered cylinders are in the right bank; odd numbered cylinders are in the left bank, when viewed from the rear of the engine).

4. Back out the adjusting nut until lash is felt at the pushrod then turn in the adjusting nut until all lash is removed. This can be determined by rotating the pushrod while turning the adjusting nut (figure 4). When the play has been removed, turn the adjusting nut in one full additional turn (to center the lifter plunger).

5. Crank the engine one revolution until the timing tab "O" mark and vibration damper mark are again in alignment. This is the number six firing position the following valves may be adjusted:
   - Exhaust: 2, 5, 6, 7
   - Intake: 3, 4, 6, 8

6. Install the rocker arm cover as outlined previously.

**VALVE STEM SEAL AND VALVE SPRING REPLACEMENT**

**Remove or Disconnect (Figures 5 and 6)**

Tools Required:
- J-23590 Air Adapter
- J-5892-B Spring Compressor
- J-23738-A Vacuum Pump

1. New seal (24) (intake valve only). Install the seal over the valve stem and seat it against the head.
2. Spring (26) with damper (25), shield (22) and cap (21) and/or rotator (28).

**Install or Connect (Figures 5, 6, and 7)**

Tools Required:
- J-23590 Air Adapter
- J-5892-B Spring Compressor
- J-23738-A Vacuum Pump

1. Install J-23590 into the spark plug hole.
2. Apply compressed air to hold the valves in place.
3. Install a rocker arm nut (figure 6).
4. Use J-5892-B to compress the valve spring (figure 6).
5. Remove the valve keepers.
6. Carefully release the spring tension. Remove J-5892-B.
7. Cap (21) and/or rotator (28), shield (22) and spring (26) with damper (25).
8. O-ring seal (23).
9. Seal (24) (intake valve only).

**Figure 4—Adjusting the Valves**

**Figure 5—Valves and Components**

- Install J-23590 into the spark plug hole.
- Apply compressed air to hold the valves in place.
- Install a rocker arm nut (figure 6).
- Use J-5892-B to compress the valve spring (figure 6).
- Remove the valve keepers.
- Carefully release the spring tension. Remove J-5892-B.

**Figure 6—Compressing the Valve Springs**
3. New O-ring seal (23) and valve keepers (20).
   • With air pressure applied to the cylinder with J-23590, compress the spring with J-5892-B (figure 6).
   • Lubricate the O-ring seal with engine oil. Install the seal on the valve stem. Make sure the seal is not twisted.
   • Install the valve keepers. Use grease to hold them in place.
   • Carefully release spring pressure. Make sure the valve keepers stay in place.
   • Remove J-5892-B and J-23590.
   • Check each O-ring seal for leakage (figure 7).
     • Place the suction cup furnished with J-23738-A over the shield.
     • Connect J-23738-A to the suction cup and apply a vacuum. Watch the vacuum pump gage. No air should be able to leak past the seal. If the seal will not hold a vacuum, it may have been damaged or improperly installed.

4. Spark plugs.
5. Rocker arms, as outlined previously.

**Adjust**
- Valves, as outlined previously.

6. Rocker arm cover, as outlined previously.

---

**Intake Manifold Replacement**

**Remove or Disconnect**
1. Battery negative cable.
2. Engine cover (G models).
3. Air cleaner.
   • Drain the cooling system.
4. AIR crossover hose (G models with TBI engines).
5. Heater hose and upper radiator hose at the intake manifold.
6. Generator bracket at the manifold.
7. Vacuum hoses at the manifold, carburetor or TBI unit, and EGR valve.
8. Electrical connections at the manifold and carburetor or TBI unit.
9. Fuel line(s) at the carburetor or TBI unit.
10. Accelerator, cruise control, and TVS cables, as equipped.
11. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
12. Air conditioning compressor and bracket and lay aside (if equipped) (except G models with TBI engines).
14. Components as follows on TBI engines:
   - Coil wires.
   - Emission control sensors and bracket on right side.
   - Cruise control transducer and bracket.
   - Fuel line bracket at rear of manifold. Move the fuel lines aside.
   - Bracket at rear of belt idler (G models).
15. Carburetor or TBI unit (if necessary).
16. Intake manifold bolts.
17. Intake manifold.
18. Gaskets and clips (some TBI engines).

**Clean**
- Old gasket and RTV from the block, heads, and intake manifold. Remove all RTV that is loose or will cause interference at assembly.
- Excessive carbon deposits from the exhaust and EGR passages.
- Excessive scale and deposits from the coolant passages.

**Inspect**
- Manifold for cracks and gasket surface damage.

**Install or Connect (Figures 8 and 9)**
1. Gaskets to the cylinder head. On TBI engines so equipped, also install the clips over the gaskets to the rib between the intake ports. Then apply a dot of RTV to the upper side of the clip.
2. RTV to the front and rear sealing surfaces on the block (figure 8). Apply a 5 mm (3/32-inch) bead of RTV (part number 1052366 or equivalent) to the front and rear of the block as shown. Extend the bead 13 mm (1/2-inch) up each cylinder head to seal and retain the gaskets.
3. Intake manifold to the engine.
4. Intake manifold bolts.
Tighten

- Intake manifold bolts to 48 N·m (35 ft. lbs.). Use the tightening sequence shown in figure 9.

5. Carburetor or TBI unit (if removed).

6. Components as follows on TBI engines:
   - Bracket at rear of belt idler (G models).
   - Fuel line bracket at rear of manifold.
   - Cruise control transducer and bracket.
   - Emission control sensors and brackets.
   - Coil wires.

7. Brake booster vacuum pipe.

8. Air conditioning compressor and bracket (if removed). Refer to AIR CONDITIONING (SEC. 1B).

9. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).

10. Accelerator, cruise control, and TVS cables, as equipped.

11. Fuel line(s) at the TBI unit or carburetor.

12. Electrical connections.

14. Generator bracket.

15. Heater hose and upper radiator hose.

16. AIR crossover hose (G models with TBI engines).

17. Air cleaner.

18. Engine cover (G models).

- Fill the cooling system with the proper quantity and grade of coolant.

**HYDRAULIC LIFTER REPLACEMENT**

**Remove or Disconnect (Figures 10 and 11)**

Tools Required:

- J-3049 Hydraulic Lifter Remover (Plier Type) or J-9290-01 Hydraulic Lifter Remover (Slide Hammer Type)

1. Rocker arm cover, intake manifold, and pushrod, as outlined previously.

2. Hydraulic lifters.
   - Remove the hydraulic lifters one at a time and place them in an organizer rack. The lifters must be installed in the same bore from which they were removed.
Figure 10—Removing the Hydraulic Lifter

- A stuck hydraulic lifter can be removed using J-3049 (figure 10) or J-9290-01 (figure 11).

**Inspect**

- Hydraulic lifter body for scuffing and scoring. If the lifter body wall is worn or damaged, the mating bore in the block should also be checked.
- Check the fit of each hydraulic lifter in its mating bore in the block. If the clearance is excessive, try a new lifter.
- The hydraulic lifter foot must be smooth and slightly convex. If worn, pitted, or damaged, the mating camshaft lobe should also be checked.

**Hydraulic Lifter Repair**

- Refer to the proper unit repair manual.

**Install or Connect**

1. Hydraulic lifters to the block. Lubricate the lifter foot and body with Engine Oil Supplement or equivalent.

**ROCKER ARM STUD REPLACEMENT**

**Install or Connect (Figure 12)**

- **Important**
  - When any new hydraulic lifters or a new camshaft is installed, change the engine oil and filter. Engine Oil Supplement (or equivalent) should be added to the crankcase oil.
  - Replace all hydraulic lifters when a new camshaft is installed.
  
2. Intake Manifold, as outlined previously.
3. Pushrod, as outlined previously.

**Adjust**

- Valves, as outlined previously.
4. Rocker arm cover, as outlined previously.

**Remove or Disconnect (Figure 12)**

- **Tool Required:**
  - J-5802-01 Rocker Arm Stud Remover

1. Rocker arm cover and rocker arm, as outlined previously.
2. Rocker arm stud.
   - Place J-5802-01 over the rocker arm stud.
   - Install a nut and flat washer.
   - Turn the nut to remove the stud (figure 12).

**Install or Connect (Figures 13 and 14)**

- **Tools Required:**
  - J-5715 Reamer (0.003-inch oversize) or J-6036 Reamer (0.013-inch oversize)
  - J-6880 Rocker Arm Stud Installer

**NOTICE:** Do not attempt to install an oversize rocker arm stud without reaming stud hole as this could damage the cylinder head.

- Ream the hole to the proper size for the replacement oversize rocker arm stud. Use J-5715 for 0.003-inch oversize studs; J-6036 for 0.013-inch oversize studs (figure 13).
Figure 13—Reaming the Rocker Arm Stud Bore (Typical)

- Coat lower end (press-fit area) of rocker arm stud with hypoid axle lubricant.
1. Rocker arm stud. Use J-6880 (figure 14). Stud is installed to proper depth when the tool bottoms on the cylinder head.
2. Rocker arm, as outlined previously.

Adjust
- Valves, as outlined previously.
3. Rocker arm cover, as outlined previously.

EXHAUST MANIFOLD REPLACEMENT

Remove or Disconnect
1. Battery negative cable.
2. Engine cover (G models).
- Raise the vehicle. Support with suitable safety stands.
3. Exhaust pipe at the manifold.
- Lower the vehicle.
4. Oxygen sensor wire (if used) (left side manifold). Do not remove the oxygen sensor unless replacement is required.
5. AIR hose at the check valve.
6. Heat stove pipe (right side manifold).
7. Components as follows on R and V models:
   - Air conditioning compressor rear bracket at the manifold (left side manifold).
   - Diverter valve and bracket (right side manifold).
8. Components as follows on G models with TBI engines:
   - Power steering pump rear bracket at the manifold (left side manifold).
   - Dipstick tube bracket (right side manifold).
9. AIR pipe bracket at the manifold stud (carbureted engines — left side manifold).
10. Exhaust manifold bolts, washers, tab washers and spark plug heat shields, as equipped.
    - Cast manifolds are retained by bolts, tab washers, and plain washers. Remove the outside bolts first, then the center bolts.
    - Tubular (stainless steel) manifolds are retained by bolts and plain washers.
11. Exhaust manifold.

Clean
- Mating surfaces on the manifold and head.
- Threads on the exhaust manifold bolts.

Install or Connect
1. Exhaust manifold to the cylinder head.
2. Exhaust manifold fasteners and spark plug heat shields (where used).
   - Cast manifolds: Install the flat washers against the manifold, then the tab washers and bolts.

Tighten
- Two center bolts to 36 N·m (26 ft. lbs.).
- Outside bolts to 28 N·m (20 ft. lbs.).
- Bend the tab washers against the bolt heads.

   - Tubular (stainless steel) manifolds: Install the bolts and flat washers.

Bolts to 36 N·m (26 ft. lbs.).
3. Components as follows on G models with TBI engines:
   - Power steering pump rear bracket at the manifold (left side manifold).
   - Dipstick tube bracket (right side manifold).
4. Components as follows on R and V models:
   - Air conditioning compressor rear bracket at the manifold (left side manifold).
   - Diverter valve and bracket (right side manifold).
5. Air bracket at the manifold (carbureted engines — left side manifold).
6. Heat stove pipe (right side manifold).
7. Air hose at the check valve.
8. Oxygen sensor wire (if used).
   • Raise the vehicle. Support with suitable safety stands.
   • Lower the vehicle.
10. Engine cover.
11. Battery negative cable.

**CYLINDER HEAD REPLACEMENT**

+++ **Remove or Disconnect**

1. Battery negative cable.
2. Engine cover (G models).
   • Drain the cooling system.
3. Intake manifold, as outlined previously.
4. Exhaust manifold, as outlined previously.
5. Ground strap at rear of cylinder head (right side cylinder head).
6. Components as follows for right side cylinder head on R and V models:
   — Air pipe at the rear of the cylinder head.
   — Spark plug wires from the support brackets.
   — Generator, and lay aside.
7. Components as follows for left side cylinder head on R and V models:
   — Air conditioning compressor and front bracket (if equipped) and lay aside.
   — Power steering pump, and lay aside.
   — Coolant sensor wire.
   — Spark plug wires from the support brackets.
   — Air pipe at the rear of the cylinder head.
8. Components as follows for right side cylinder head on G models with TBI engines:
   — Air pump bolt and spacer at the cylinder head.
   — Nut and stud attaching air conditioning compressor to cylinder head.
   — Fuel pipe, plug wire and wiring harness brackets at the rear of the cylinder head.
9. Components as follows for left side cylinder head on G models with TBI engines:
   — Nut and stud attaching main accessory bracket to the cylinder head. It may be necessary to loosen the remaining bolts and studs and move the bracket forward slightly for clearance to remove the cylinder head.
   — Coolant sensor wire.
   — Cruise control transducer and spark plug wire brackets at the rear of the cylinder head.
10. Components as follows on carbureted engines:
    — Generator, and lay aside (right side cylinder head).
    — Air conditioning compressor and bracket, and lay aside (left side cylinder head).
11. Rocker arm cover, as outlined previously.
12. Spark plugs.
13. Pushrods, as outlined previously.
15. Cylinder head.

---

**Clean**

— Carbon deposits from combustion chambers.
— All traces of old head gasket from cylinder head and block.
— Cylinder head bolt threads and threads in the block.

**Inspect**

• Sealing surfaces of the block and cylinder head for nicks, heavy scratches, or other damage.

**Cylinder Head Repair**

• Refer to the proper Unit Repair Manual.

+++ **Install or Connect (Figure 15)**

1. Head gasket.
   • If a steel gasket is used, coat both sides of the gasket with sealer. Spread the sealer thin and even.
   • Do not use sealer on composition steel-asbestos gaskets.
   • Place the gasket over the block dowel pins with the bead up.
2. Cylinder head. Carefully guide the cylinder head into place over the dowel pins and gasket.

---

**Figure 15—Cylinder Head Bolt Tightening Sequence**

16. Head gasket.

**Figure 16—Removing the Torsional Damper**
3. Cylinder head bolts. Coat threads of the cylinder head bolts with sealing compound (GM part number 1052080 or equivalent) and install finger-tight.

4. Pushrods, as outlined previously.

5. Rocker arm cover, as outlined previously.

7. Components as follows for right side cylinder head on R and V models:
   - AIR pipe at the rear of the cylinder head.
   - Spark plug wires to the support brackets.
   - Generator.

8. Components as follows for left side cylinder head on R and V models:
   - Air conditioning compressor and front bracket (if equipped).
   - Power steering pump.
   - Coolant sensor wire.
   - Spark plug wires to the support brackets.
   - AIR pipe at the rear of the cylinder head.

9. Components as follows for right side cylinder head on G models with TBI engines:
   - AIR pump bolt and spacer at the cylinder head.
   - Nut and stud attaching the air conditioning compressor to the cylinder head.
   - Fuel pipe, plug wire and wiring harness brackets at the rear of the cylinder head.

10. Components as follows for left side cylinder head on G models with TBI engines:
    - Nut and stud attaching main accessory bracket to the cylinder head.
    - Remaining main accessory bracket bolts and nuts, if necessary.
    - Coolant sensor wire.
    - Cruise control transducer and spark plug wire brackets at the rear of the cylinder head.

11. Components as follows on carbureted engines:
    - Generator (right side cylinder head).
    - Air conditioning compressor and bracket (left side cylinder head).

12. Ground strap at the rear of the cylinder head (right side cylinder head).

13. Exhaust manifold, as outlined previously.

14. Intake manifold, as outlined previously.

15. Engine cover (G models).

16. Battery negative cable.

   • Fill the cooling system with the proper quantity and grade of coolant.

---

**TORSIONAL DAMPER AND FRONT CRANKSHAFT SEAL REPLACEMENT**

**Remove or Disconnect (Figure 16)**

Tool Required:
- J-23523-E Torsional Damper Puller and Installer

1. Fan belts, fan, and pulley.
2. Fan shroud assembly.
3. Accessory drive pulley.
4. Torsional damper bolt.
6. Front crankshaft seal. Pry out with a large screwdriver. Take care not to distort the timing cover.
7. Crankshaft key, if necessary.

**Inspect**

- Oil seal contact area on the torsional damper shaft for grooving and roughness. Replace if necessary.

**Install or Connect (Figures 17 and 18)**

Tools Required:
- J-35468 Seal Installer
- J-23523-E Torsional Damper Puller and Installer
1. Crankshaft key, if removed.
2. Front crankshaft seal. Use J-35468 (figure 17). The open end of the seal faces inside the engine. Coat the seal lips with engine oil.

**NOTICE:** The inertia weight section of the torsional damper is assembled to the hub with a rubber type material. The correct installation procedures (with the proper tool) must be followed or movement of the inertia weight section of the hub will destroy the tuning of the torsional damper.

3. Stud (item A, figure 18) to the crankshaft. Thread the stud fully into the tapped hole in the crankshaft.

4. Torsional damper over the end of the stud. Align the keyway in the torsional damper shaft with the crankshaft key.

5. Bearing, washer and nut (figure 18).
   - Turn the nut to pull the vibration damper into place.
   - Remove the tool.
   - Use a small amount of RTV sealant to seal the torsional damper key to crankshaft joint.

6. Torsional damper bolt and washer.
   - Bolt to 95 N·m (70 ft. lbs.).

7. Accessory drive pulley.

8. Fan shroud assembly.

**FRONT COVER REPLACEMENT**

**Remove or Disconnect**
1. Torsional damper, as outlined previously.
2. Water pump.
3. Oil pan, as outlined later.
4. Front cover bolts.
5. Front cover.
6. Front cover to block gasket.
7. Front crankshaft seal from the front cover. Pry out with a screwdriver. Take care not to distort the front cover.

**Clean**
- Old gasket from the front cover and block.

**Inspect**
- Front cover for distortion and damage. Replace if necessary.

**Install or Connect (Figure 19)**
Tools Required:
- J-35468 Seal Installer
1. Front crankshaft seal. Use J-35468 (figure 19). The open end of the seal faces inside the engine. Coat the seal lips with engine oil.
2. Front cover gasket to the front cover. Use gasket cement to hold it in place.
3. Front cover to the engine.

**OIL PAN REPLACEMENT**

**Remove or Disconnect (Figure 20)**
1. Battery negative cable.
   - Raise the vehicle. Support with suitable safety stands.
   - Drain the engine oil.
2. Exhaust crossover pipe.
3. Flywheel/torque converter cover.
4. Strut rods at the engine mountings (V models with automatic transmissions).
5. Oil pan bolts, nuts, and reinforcements.
6. Oil pan and gasket.

**Clean**
- Gasket surfaces on the engine and oil pan.

**Inspect**
- Oil pan gasket for damage. Replace if necessary.

**Install or Connect (Figure 20)**
- Apply sealant (GM part number 1052080 or equivalent) to the front cover to block joint and to the rear crankshaft seal to block joint. Apply the sealant for about 25 mm (1 inch) in both directions from each of the four corners.
1. Oil pan gasket to the oil pan.
2. Oil pan to the engine.
3. Oil pan bolts, nuts, and reinforcements.

**Tighten**
- Oil pan bolts to 11.3 N·m (100 in. lbs.).
- Oil pan nuts to 22.6 N·m (200 in. lbs.).
4. Strut rods at the engine mount (V models with automatic transmissions).
5. Flywheel/torque converter cover.
   - Lower the vehicle.
7. Proper quantity and grade of engine oil.
8. Battery negative cable.

**OIL PUMP REPLACEMENT**

![Image of oil pump components]

**Remove or Disconnect (Figure 20)**
1. Oil pan, as outlined previously.
2. Nuts (73) (if equipped).
4. Oil pump (70) and baffle (71) (if equipped).

**Inspect**
- Oil pump pickup tube for looseness. If the tube is loose in the oil pump body, replace it, as outlined in the proper unit repair manual. A loose pickup tube can result in an air leak and loss of oil pressure.

**Oil Pump Repair**
- Refer to the proper unit repair manual.

**Install or Connect (Figure 20)**
1. Oil pump to the engine. Align the slot in the oil pump shaft with the tang on the distributor shaft. The oil pump should slide easily into place. No gasket is used.
2. Baffle (71) (if equipped) and bolt (72). 
   - **Tighten**
     - Bolt (72) to 90 N·m (65 ft. lbs.).
3. Nuts (73) (if equipped).
   - **Tighten**
     - Nuts (73) to 34 N·m (25 ft. lbs.).
4. Oil pan, as outlined previously.

**REAR CRANKSHAFT OIL SEAL REPLACEMENT**

**Remove or Disconnect (Figure 21)**
1. Transmission.
2. Clutch and flywheel or flexplate, as equipped.

**NOTICE:** Care should be taken when removing the rear crankshaft oil seal so as not to nick the crankshaft sealing surface.

3. Rear crankshaft oil seal. Insert a screwdriver into the notches provided in the seal retainer and pry the seal out (figure 21). Take care not to damage the crankshaft seal surface.

**Inspect**
- Chamfer on crankshaft for grit, loose rust, and burrs. Correct as necessary.
Clean

- Seal running surface on the crankshaft with a non-abrasive cleaner.

Install or Connect (Figure 22)

Tool Required:
- J-35621 Seal Installer

1. Rear crankshaft oil seal (figure 22).
   - Lubricate the inner and outer diameter of the seal with engine oil.
   - Install the seal on J-35621.
   - Position J-35621 against the crankshaft. Thread the attaching screws into the tapped holes in the crankshaft.
   - Tighten the screws securely with a screwdriver. This will ensure that the seal is installed squarely over the crankshaft.
   - Turn the handle until it bottoms.
   - Remove J-35621.
2. Clutch and flywheel or flexplate, as equipped.
3. Transmission.

Remove or Disconnect (Figures 21 and 23).

1. Transmission.
2. Clutch and flywheel or flexplate, as equipped.
3. Oil pan, as outlined previously.
4. Screws (80) and nuts (81).
5. Seal retainer (82).
6. Gasket (84).
7. Rear crankshaft oil seal. Insert a screwdriver into the notches provided in the seal retainer and pry the seal out (figure 21).

Clean

- Gasket surfaces on block and seal retainer.

Install or Connect (Figure 23)

- Whenever the seal retainer is removed, a new retainer gasket and rear crankshaft oil seal must be installed.

1. Gasket (84) to the block. It is not necessary to use sealant to hold the gasket in place.
2. Seal retainer (82).
3. Screws (80) and nuts (81).

Tighten

- Screws (80) and nuts (81) to 15.3 N·m (135 in. lbs.).
4. Oil pan, as outlined previously.
5. Rear crankshaft oil seal as outlined previously.
6. Clutch and flywheel or flexplate, as equipped.
7. Transmission.
MEASURING CHAMSHAFT LOBE LIFT

Tool Required:
J-8520 Camshaft Lobe Lift Indicator

1. Remove the rocker arm as outlined previously.
2. Refer to figure 24. Position the dial indicator (part of J-8520) so the plunger rests on the pushrod end, as shown. Make sure the pushrod is in the lifter socket.
3. Rotate the crankshaft slowly in the direction of normal rotation until the lifter is on the heel of the cam lobe. At this point, the pushrod will be in its lowest position.
4. Set dial indicator on zero, then rotate the crankshaft slowly, or attach an auxiliary starter switch and "bump" the engine over, until the pushrod is in fully raised position.

Important
- Whenever the engine is cranked remotely at the starter, with a special jumper cable or other means, the distributor primary lead or coil primary leads should be disconnected.
5. Compare the total lift recorded from the dial indicator with specifications.
6. If camshaft readings for all lobes are within specifications, remove dial indicator assembly.
7. Install the rocker arm and adjust the valves as previously outlined.

CAMSHAFT REPLACEMENT

Remove or Disconnect (Figures 25, 26, and 27)
Tool Required:
J-5825-A Crankshaft Sprocket Puller
1. Battery negative cable.
2. Engine cover (G models).
3. Air cleaner.
4. Grille (G models).
5. Air conditioning condensor from its mounting and swing it forward (G models).

Figure 26—Replacing the Crankshaft Sprocket
6A4-18 SMALL BLOCK

6. Fan, shroud, and radiator. Refer to ENGINE COOLING (SEC. 6B).
7. Rocker arm covers, as outlined previously.
8. Water pump. Refer to ENGINE COOLING (SEC. 6B).
9. Torsional damper, as outlined previously.
10. Front cover, as outlined previously.
11. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
12. Intake manifold, as outlined previously.
13. Pushrods and hydraulic lifters, as outlined previously.
   • Align the timing marks (figure 25).
15. Camshaft sprocket bolts.
16. Camshaft sprocket and timing chain. The sprocket is a light interference fit on the camshaft. Tap the sprocket on its lower edge to loosen it.
17. Crankshaft sprocket (if required). Use J-5825 (figure 26).
18. Front engine mounting through bolts.

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.
   • Install two or three 5/16-18 bolts 100-125 mm (4-5 inches) long into the camshaft threaded holes. Use these bolts to handle the camshaft (figure 27).
   • Pull the camshaft from the block. Use care to prevent damage to the camshaft bearings.

Cleaning Inspection and Repair
Clean, inspect and repair or replace the camshaft and related components, as outlined in the proper unit repair manual. The unit repair manual also describes camshaft bearing replacement.

Install or Connect (Figures 25 through 27 and 35 through 38)
Tool Required: J-5590 Crankshaft Sprocket Installer
   • Coat the camshaft lobes and journals with a high quality engine oil supplement (GM Engine Oil Supplement or equivalent).
   1. Two or three 5/16-18 bolts 100-125 mm (4-5 inches) long into the camshaft threaded holes. Use these bolts to handle the camshaft.
   2. Camshaft to the engine (figure 27). Handle the camshaft carefully to prevent damage to the camshaft bearings.
   • Lower the engine.
3. Engine mount through-bolts.

NOTICE: See "Notice" on page 6A4-1 of this section.

Tighten
   • Through-bolts to specifications. Refer to figures 35 through 38.
5. Camshaft sprocket and timing chain.

Important
   • Line up the timing marks on the camshaft sprocket and crankshaft sprocket (figure 25).
6. Camshaft sprocket bolts.

Tighten
   • Bolts to 24 N m (18 ft. lbs.).
7. Fuel pump and pushrod (carbureted engines).
8. Hydraulic lifters and pushrods, as outlined previously.

Important
   • Replace all hydraulic lifters, change the engine oil and filter, and add GM Engine Oil Supplement (or equivalent) to the engine oil whenever a new camshaft is installed.

Adjust
   • Valves, as outlined previously.
9. Intake manifold, as outlined previously.
10. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
11. Front cover, as outlined previously.
12. Torsional damper, as outlined previously.
13. Water pump. Refer to ENGINE COOLING (SEC. 6B).
14. Rocker arm covers, as outlined previously.
15. Fan, shroud, and radiator. Refer to ENGINE COOLING (SEC. 6B).
16. Air conditioning condensor (G models).
17. Grille (G models).
18. Air cleaner.
19. Engine cover (G models).
20. Battery negative cable.
   • Fill the cooling system with the proper quantity and grade of coolant.

**CONNECTING ROD AND PISTON REPLACEMENT**

Remove or Disconnect (Figure 28)

Tool Required:
J-5239 Guide Set
1. Cylinder head, as outlined previously.
2. Oil pan, as outlined previously.
3. Oil pump, as outlined previously (if necessary).
4. Ridge or deposits from the upper end of the cylinder bores.
   • Turn the crankshaft until the piston is at BDC.
   • Place a cloth on top of the piston.
   • Perform the cutting operation with a ridge reamer.
   • Turn the crankshaft until the piston is at TDC.
   • Remove the cloth and cuttings.
5. Connecting rod cap. Check the connecting rod and cap for identification marks. Mark the parts if required. The connecting rod and cap must be kept together as mating parts.
6. Connecting rod and piston.
   • Attach J-5239 to the connecting rod bolts (figure 28).
   • Use the long guide rod of J-5239 to push the connecting rod and piston out of the bore.
7. Connecting rod bearing.

Cleaning, Inspection, and Repair

Clean, inspect and repair or replace the components as necessary. Measure connecting rod bearing clearance, piston clearance, ring clearances, etc. Refer to the proper unit repair manual.

The unit repair manual contains information on:
— Connecting rod and piston.
— Piston rings.
— Connecting rod and crankpin.
— Cylinder bores.

Install or Connect (Figures 28 through 31)

Tools Required:
J-5239 Connecting Rod Guide Set
J-8037 Ring Compressor
• Make sure the cylinder walls are clean. Lubricate the cylinder wall lightly with engine oil.
• Make sure the piston is installed in the matching cylinder.
1. Connecting rod bearings.
   • Be certain that the bearings are of the proper size.

Figure 28—Replacing the Piston and Connecting Rod

• Install the bearings in the connecting rod and connecting rod cap.
• Lubricate the bearings with engine oil.
2. Piston and connecting rod to the proper bore.
   • With the connecting rod cap removed, install J-5239 onto the connecting rod studs.
   • Locate the piston ring end gaps as shown in figure 29. Lubricate the piston and rings.
   • Without disturbing the ring end gap location, install J-8037 over the piston (figure 30).

Figure 29—Piston Ring End Gap Locations
The piston must be installed so that the notch in the piston faces the front of the engine (figure 29).

Place the piston in its matching bore. The connecting rod bearing tang slots must be on the side opposite the camshaft. Using light blows with a hammer handle, tap the piston down into its bore (figure 30). At the same time, from beneath the vehicle guide the connecting rod to the crankpin with J-5239 (figure 28). Hold the ring compressor against the block until all rings have entered the cylinder bore.

Remove J-5239 from the connecting rod bolts.

Each connecting rod and bearing cap should be marked, beginning at the front of the engine. Cylinders 1, 3, 5 and 7 are the left bank and, 2, 4, 6, and 8 are the right bank. The numbers on the connecting rod and bearing cap must be on the same side when installed in the cylinder bore. If a connecting rod is ever transposed from one block or cylinder to another, new connecting rod bearings should be fitted and the connecting rod should be numbered to correspond with the new cylinder number.

Measure

- Connecting rod bearing clearance. Refer to the proper unit repair manual.

3. Connecting rod cap and bearing.

4. Connecting rod cap nuts.

Tighten

- Connecting rod cap nuts to 60 N m (45 ft. lbs.).

Measure

- Connecting rod side clearance. Use a feeler gage between the connecting rods (figure 31). The correct clearance is 0.006-0.014-inch.

5. Oil pump (if removed), as outlined previously.

6. Oil pan and cylinder head, as outlined previously.

**OIL FILTER BYPASS VALVE**

**Remove or Disconnect (Figure 32)**

1. Oil filter.

**Inspect**

- Bypass valve spring and valve disc for proper operation, cracks, and damage. If replacement is needed, the oil filter bypass valve (93) must be replaced, as follows:

2. Bolts (94).

3. Oil filter bypass valve.
Figure 33—Removing the Main Bearing Insert

Clean
- Valve chamber in the block.

Install or Connect (Figure 32)
1. Oil filter bypass valve (93).
2. Bolts (94).

Tighten
- Bolts (94) to 26 N·m (20 ft. lbs.).
3. Oil filter.
4. Engine oil, as needed.

MAIN BEARING REPLACEMENT

Remove or Disconnect (Figure 33)
Tool Required:
J-8080 Main Bearing Remover/Installer
1. Spark plugs.
2. Oil pan, as outlined previously.
3. Oil pump, as outlined previously.
4. Main bearing caps.
   - Check the main bearing caps for location markings. Mark the caps if necessary. The caps must be returned to their original locations during assembly.
5. Lower main bearing inserts from the main bearing caps.
6. Upper main bearing inserts.
   - Insert J-8080 into the crankshaft oil hole (figure 33).
   - Rotate the crankshaft to “turn” the bearing insert out of the block.

Cleaning, Inspection, and Repair
Clean, inspect, and repair or replace the components as required. Refer to the proper unit repair manual. The unit repair manual contains information on
- Crankshaft.
- Main and connecting rod bearings.

Figure 34—Measuring Crankshaft End Play

Install or Connect (Figures 33 and 34)
Tool Required:
J-8080 Main Bearing Remover/Installer
1. Upper main bearing inserts.
   - Insert tool J-8080 into a crankshaft main bearing oil hole (figure 33).
   - Apply engine oil to inserts of the proper size.
   - Insert the plain end (without the bearing tang) of the insert between the crankshaft and the notched side of the block.
   - Rotate the crankshaft to “roll” the insert into the block.
   - Remove the tool.
2. Lower main bearing inserts to the main bearing caps.
   - Make sure the inserts are of the proper size.
   - Apply engine oil to the inserts.

Measure
- Main bearing clearance. Refer to the proper unit repair manual. If the engine is in the vehicle, the crankshaft must be supported upward to remove any clearance from the upper bearing. The total clearance can then be measured between the lower bearing and journal.
3. Main bearing caps (except rear cap) and bolts to the block.

Tighten
- Main bearing cap bolts to specifications.
  - Outer bolts on #2, #3, and #4 main bearing caps: 95 N·m (70 ft. lbs.).
  - All others: 110 N·m (80 ft. lbs.).
4. Rear main bearing cap and bolts.

Tighten
- Rear main bearing cap bolts temporarily to 14 N·m (10 ft. lbs.).
Measure

- Crankshaft end play, as follows:
  - Tap the end of the crankshaft first rearward then forward with a lead hammer. This will line up the rear main bearing and crankshaft thrust surfaces.
  - Tighten the rear main bearing cap bolts to 110 N·m (80 ft. lbs.).
  - With the crankshaft forced forward, measure at the front end of the rear main bearing with a feeler gage (figure 34). The proper clearance is 0.002–0.006-inch.
- If correct end play cannot be obtained, be certain that the correct size rear main bearing has been installed. Production engines may have rear main bearings that are 0.008-inch wider across the thrust faces than standard. Refer to the proper unit repair manual for more information.

8. Oil pump, as outlined previously.
9. Oil pan, as outlined previously.
10. Spark plugs.

CRANKSHAFT REPLACEMENT

1. Remove the engine, as outlined later.
2. Refer to the proper unit repair manual for crankshaft replacement procedures.

FLYWHEEL REPLACEMENT

Remove or Disconnect

1. Transmission, flywheel housing, and clutch.
2. Flywheel bolts.
3. Flywheel.

Clean

- Mating surfaces of crankshaft and flywheel. Remove any burrs.

Inspect

- Flywheel for burning, scoring, warping, and wear. Replace the flywheel if necessary. Do not machine the flywheel.
- Flywheel ring gear for worn or broken teeth.

Flywheel Ring Gear Replacement

1. Use a torch to heat the gear around the entire circumference, then drive the gear off the flywheel, using care not to damage the flywheel.

NOTICE: Never heat starter gear to red heat as this will change metal structure.

2. Uniformly heat the flywheel gear to temperature which will expand the gear to permit installation. Temperature must not exceed 204°C (400°F).
3. As soon as the gear has been heated, install on the flywheel.

Install or Connect

1. Flywheel.
2. Flywheel bolts.

Tighten

- Flywheel bolts to 100 N·m (75 ft. lbs.).
3. Clutch, flywheel housing, and transmission.

ENGINE MOUNTINGS

NOTICE: Broken or deteriorated mountings can cause misaligned and eventual destruction of certain drive train components. When a single mounting breakage occurs, the remaining mountings are subjected to abnormally high stresses.

INSPECTING ENGINE MOUNTINGS

Front Engine Mountings

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

1. Raise the engine to remove weight from the mountings and to place a slight tension on the rubber cushion. Observe both mountings while raising the engine.
2. Replace the mounting if the following conditions exist:
   - Hard rubber surface covered with heat check cracks.
   - Rubber cushion separated from the metal plate of the mounting.
   - Rubber cushion split through the center.
3. If there is movement between a metal plate of the mounting and its attaching points, lower the engine and tighten the bolts or nuts attaching the mounting to the engine, frame, or bracket.

Rear Mountings

1. Push up and pull down on the transmission tailshaft. Observe the transmission mounting.
2. Replace the mounting if the following conditions exist:
   - Rubber cushion separated from the metal plate of the mounting.
   - Mounting bottomed out (tailshaft can be moved up but not down).
3. If there is relative movement between a metal plate of the mounting and its attaching point, tighten the bolts or nuts attaching the mounting to the transmission or crossmember.
FRONT MOUNTING REPLACEMENT

**Remove or Disconnect** (Figures 35 through 38)

**NOTICE:** When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

- Support the engine with a suitable jack. Do not load the engine mounting.
  1. Engine mounting through-bolt and nut.

**NOTICE:** Raise the engine only enough for sufficient clearance. Check for interference between the rear of the engine and the dash panel which could cause distributor housing damage.

- Raise the engine only enough to permit removal of the engine mounting.
- Mounting assembly bolts, nuts, and washers.
- Mounting assembly.

**Install or Connect** (Figures 35 through 38)

1. Mounting assembly.

**NOTICE:** See “Notice” on page 6A4-1 of this section.

2. Mounting assembly bolts, nuts, and washers.

**Tighten**

- Fasteners to specifications. Refer to figures 35 through 38.
- Engine mount through-bolt and nut lower the engine until the bolt can be inserted. Install the nut.

**REAR MOUNTING REPLACEMENT (EXCEPT P-MODELS WITH FLYWHEEL HOUSING MOUNTING)**

**Remove or Disconnect** (Figures 39 through 42)

**NOTICE:** When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

- Support the rear of the engine to relieve the weight on the rear mountings.
  1. Mounting to crossmember nut(s) and washer(s).
  2. Mounting to transmission bolts and washers.
  3. Mounting to transmission bolts and washers.
  4. Raise the rear of the engine only enough to permit removal of the mounting.
  5. Mounting.

**Install or Connect** (Figure 43)

1. Engine mounting. Align the hole in the mounting with the hole in the crossmember.

**Tighten**

- Bolt to 90 N·m (65 ft. lbs.).

**ENGINE REPLACEMENT**

**R AND V MODELS**

**Remove or Disconnect**

1. Battery negative cable.
2. Hood.
3. Drain the cooling system.
4. Air cleaner.

7. Radiator and shroud. Refer to RADIATOR (SEC. 6B2).
8. Heater hoses at the engine.
9. Accelerator, cruise control, and detent linkage (if used) from carburetor.
10. Air conditioning compressor (if used) and lay aside.
11. Power steering pump (if used) and lay aside.
12. Engine wiring harness from the engine.

**Install or Connect** (Figures 39 through 42)

1. Mounting.
   - Lower the rear of the engine.
2. Mounting to transmission bolts and washers.

**NOTICE:** See “Notice” on page 6A4-1 of this section.

3. Mounting to crossmember nut(s) and washer(s).

**Tighten**

- Fasteners to specifications. Refer to figures 39 through 42.

**REAR MOUNTING REPLACEMENT (P MODELS WITH FLYWHEEL HOUSING MOUNTING)**

**Remove or Disconnect** (Figure 43)

1. Bolt, cushion, and spacer.

**NOTICE:** When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

- Raise the rear of the engine only enough to permit removal of the mounting.
- Engine mounting.

**Install or Connect** (Figure 43)

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology "NOTICE: See 'Notice' on page 6A5-1 of this section."

NOTICE: All engine fasteners are important attaching parts in that they could affect the performance of vital components and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of this part.

### DESCRIPTION

7.4L engines are 90-degree V8 type, overhead valve, water cooled, with cast iron block and heads.

The crankshaft is supported by five precision insert main bearings, with crankshaft thrust taken at the number five (rear) bearing.

The camshaft is supported by five plain type bearings and is chain driven. Motion from the camshaft is transmitted to the valves by hydraulic lifters, pushrods, and ball type rocker arms. The valve guides are integral in the cylinder head.

The connecting rods are forged steel, with precision insert type crankpin bearings. The piston pins are a press fit in the connecting rods.

The pistons are cast aluminum alloy. The piston pins are a floating fit in the piston.

### ENGINE LUBRICATION

Lubrication schematics are shown in Figure 1. The gear type oil pump is driven from the distributor shaft, which is gear driven from the camshaft. Oil is drawn into the oil pump through a pickup screen and pipe.

Pressurized oil is routed to the oil filter. In case of excessive oil pressure, a bypass valve is provided. Filtered oil flows into the main gallery and then to the camshaft and crankshaft bearings. The valve lifter oil gallery supplies oil to the valve lifter. Oil flows from the hydraulic lifters through the hollow pushrods to the rocker arms. Oil from the overhead drains back to the crankcase through oil drain holes.

The timing chain is drip fed from the front camshaft bearing. The pistons and piston pins are lubricated by oil splash.
Cylinder walls are oiled by oil thrown off pressure fed connecting rod bearings.

ON-VEHICLE SERVICE

ROcker ARM COVER Replacement

- Remove or Disconnect (Figure 2)
  1. Battery negative cable.
  2. Air cleaner.
  3. Crankcase ventilation hoses at the rocker arm cover.
  4. Wiring harnesses from the clips at the rocker arm cover.
  5. Spark plug wire clip from the bracket. Move the spark plug wire loom out of the way (TBI engines).
  6. Heat stove pipe (right side rocker arm cover).
  7. Air conditioning compressor rear brace (if equipped) (left side rocker arm cover).
  8. Rocker arm cover nuts, reinforcements, and clips.
  9. Rocker arm cover and gasket.

- Clean
  - All traces of old gasket from the rocker arm cover and cylinder head.

- Inspect
  - Rocker arm cover sealing surface for distortion. Replace if necessary.

- Install or Connect
  1. Rocker arm cover and new gasket.
  2. Reinforcements, clips, and nuts.
  3. Nuts to 13.0 N m (115 in. lbs.).
  4. Air conditioning compressor rear brace (if removed).
  5. Heat stove pipe (if removed).
  6. Wiring harnesses and spark plug wire loom (TBI engines).
  7. Crankcase ventilation hoses.
  8. Air cleaner.
  9. Battery negative cable.

ROCKER ARM AND PUSHROD Replacement

- Remove or Disconnect
  1. Rocker arm cover, as outlined previously.
  2. Rocker arm nut.
  3. If only the pushrod is to be replaced, back the rocker arm nut off until the rocker arm can be swung away from the pushrod. Then pull the pushrod out.
  4. Rocker arm with ball.
  5. Pushrod.

- Important
  - Store used components in order so they can be reassembled in the same location.

- Inspect
  - Rocker arms and balls at their mating surfaces. These surfaces should be smooth and free from scoring or other damage.
  - Rocker arm areas which contact the valve stems and the sockets which contact the pushrods. These areas should be smooth and free of damage and wear.
  - Pushrods for bending. Roll the pushrod on a flat surface to determine if it is bent. Replace if necessary.
  - Ends of the pushrods for scoring or roughness.

- Install or Connect
  1. Pushrod. Make sure the pushrod seats properly in the hydraulic lifter.
  2. Rocker arm with ball.
  3. Rocker arm nut.

- Important
  - When new rocker arms and/or balls are installed, coat their bearing surfaces with "Molykote" or equivalent.

- Adjust
  - Valves as outlined later.
  4. Rocker arm cover, as outlined previously.
VALVE ADJUSTMENT

1. Remove the rocker arm cover as outlined previously.

2. Crank the engine until the mark on the vibration damper lines up with the "O" mark on the timing tab and the engine in the number one firing position. This may be determined by placing fingers on the number one valve as the mark on the damper comes near the "O" mark on the timing tab. If the rocker arms are not moving, the engine is in the number one firing position. If the rocker arms move as the mark comes up to the timing tab, the engine is in the number six firing position and should be turned over one more time to reach the number one position.

3. With the engine in the number one firing position as determined above, the following valves may be adjusted:
   - Exhaust: 1, 3, 4, 8
   - Intake: 1, 2, 5, 7

   (Even numbered cylinders are in the right bank; odd numbered cylinders are in the left bank, when viewed from the rear of the engine).

4. Back out the adjusting nut until lash is felt at the pushrod then turn in the adjusting nut until all lash is removed. This can be determined by rotating the pushrod while turning the adjusting nut (figure 3). When the play has been removed, turn the adjusting nut in three quarters (¾) additional turn (to center the lifter plunger).

5. Crank the engine one revolution until the timing tab "O" mark and vibration damper mark are again in alignment. This is the number six firing position the following valves may be adjusted:
   - Exhaust: 2, 5, 6, 7
   - Intake: 3, 4, 6, 8

6. Install the rocker arm cover as outlined previously.

VALVE STEM SEAL AND VALVE SPRING REPLACEMENT

Remove or Disconnect (Figures 4 and 5)

Tools Required:
- J-23590 Air Adapter
- J-5892-B Spring Compressor

1. Rocker arm cover, as outlined previously.
2. Rocker arms, as outlined previously.
4. Valve keepers.
   - Install J-23590 into the spark plug hole.
Adjust

- Valves, as outlined previously.
- Rocker arm covers, as outlined previously.

**INTAKE MANIFOLD REPLACEMENT**

**Remove or Disconnect**

1. Battery negative cable.
2. Air cleaner.
3. Drain the cooling system.
4. Upper radiator hose, and water pump bypass hose.
5. Heater hose and pipe (TBI engines) or heater hose (carbureted engines).
6. Wire at sensor at front of intake manifold (TBI engines).
7. Accelerator, cruise control, and TVS cables, as equipped.
8. Wiring harness from clips.
9. Cruise control transducer (if equipped).
10. Fuel line at carburetor or fuel lines at TBI unit.
11. Crankcase ventilation hoses.
12. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
13. Wires at ignition coil (TBI engines).
14. EGR solenoid with bracket (TBI engines).
15. MAP sensor with bracket (TBI engines).
16. Air conditioning compressor rear bracket (if equipped).
17. Front generator/AIR pump bracket (TBI engines) or upper generator bracket (carbureted engines).
18. Intake manifold bolts.
19. Intake manifold.
20. Gaskets and seals.

**Clean**

- Old gaskets from the block, heads, and intake manifold.
- Excessive carbon deposits from the exhaust and EGR passages.
- Excessive scale and deposits from the coolant passages.

**Inspect**

- Manifold for cracks and gasket surface damage.

**Install or Connect (Figure 6)**

1. Front and rear intake manifold seals to the block.
2. Side gaskets to the cylinder heads.
3. Intake manifold and bolts.

**Tighten**

- Bolts to 40 N·m (30 ft·lbs). Use the tightening sequence shown in figure 6.

**Install or Connect (Figures 4 and 5)**

Tools Required:
- J-23590 Air Adapter
- J-5892-B Spring Compressor

1. New seal. Install the seal over the valve stem and seat it against the head.
2. Spring with damper, and cap.
3. Valve keepers.
   - With air pressure applied to the cylinder with J-23590, compress the spring with J-5892-B (figure 5).
   - Install the valve keepers. Use grease to hold them in place.
   - Carefully release spring pressure. Make sure the valve keepers stay in place.
   - Remove J-5892-B and J-23590.
4. Spark plugs.
5. Rocker arms, as outlined previously.
FRONTI

Figure 6—Intake Manifold Tightening Sequence

8. Wires at ignition coil (TBI engines).
9. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
11. Crankcase ventilation hoses.
12. Fuel line or lines.
13. Cruise control transducer (if equipped).
14. Wiring harnesses to the clips.
15. Accelerator, cruise control, and TV cables.
17. Heater hose and pipe (TBI engines) or heater hose (carbureted engines).
18. Water pump bypass hose, heater hose, and upper radiator hose.
19. Air cleaner.
20. Battery negative cable.

- Fill the cooling system with the proper quantity and grade of coolant.

HYDRAULIC LIFTER REPLACEMENT

Remove or Disconnect (Figures 7 and 8)

Tools Required:
J-3049 Lifter Remover (Plier Type) or
J-9290-01 Lifter Remover (Slide Hammer Type)

Rocker arm cover, intake manifold, and pushrod, as outlined previously.
Hydraulic lifters.

— Remove the hydraulic lifters one at a time and place them in an organizer rack. The lifters must be installed in the same bore from which they were removed.
— A stuck hydraulic lifter can be removed using J-3049 (figure 7) or J-9290-01 (figure 8).

Inspect
— Hydraulic lifter body for scuffing and scoring. If the lifter body wall is worn or damaged, the mating bore in the block should also be checked.
— Check the fit of each hydraulic lifter in its mating bore in the block. If the clearance is excessive, try a new lifter.
— The hydraulic lifter foot must be smooth and slightly convex. If worn, pitted, or damaged, the mating camshaft lobe should also be checked.

Hydraulic Lifter Repair
- Refer to the proper unit repair manual.

Install or Connect

1. Hydraulic lifters to the block. Lubricate the lifter foot and body with Engine Oil Supplement or equivalent.

Important
- When any new hydraulic lifters or a new camshaft is installed, replace the engine oil and filter. Engine Oil Supplement (or equivalent) should be added to the crankcase oil.
- Replace all hydraulic lifters when a new camshaft is installed.

2. Intake Manifold, as outlined previously.
3. Pushrod, as outlined previously.

Adjust
- Valves, as outlined previously.
4. Rocker arm cover, as outlined previously.
ROCKER ARM STUD REPLACEMENT

 Remove or Disconnect
 1. Rocker arm cover and rocker arm, as outlined previously.
 2. Rocker arm stud. Use a deep socket.

 Install or Connect
 1. Rocker arm stud.

 Tighten
 • Rocker arm stud to 68 N·m (50 ft. lbs.).
 2. Rocker arm, as outlined previously.

 Adjust
 • Valves, as outlined previously.
 3. Rocker arm cover, as outlined previously.

EXHAUST MANIFOLD REPLACEMENT

 Remove or Disconnect
 1. Battery negative cable.
 2. Heat stove pipe (right side manifold).
 3. Dipstick tube (right side manifold).
 4. Oxygen sensor wire (left side manifold) (TBI engines). Do not remove the sensor unless it is to be replaced.
 5. AIR hose at the check valve.
 7. Exhaust pipe at the manifold.
 8. Exhaust manifold bolts and spark plug heat shields.

 Clean
 — Mating surface on the manifold and head.
 — Threads on the exhaust manifold bolts.

 Install or Connect
 1. Exhaust manifold.
 2. Exhaust manifold bolts and spark plug shields.

 Tighten
 • Exhaust manifold bolts to 54 N·m (40 ft. lbs.).
   — Tighten the center bolts first, then continue outward each way.
 3. Exhaust pipe.
 4. Spark plugs.
 5. AIR hose.
 6. Oxygen sensor wire (TBI engines) (left side manifold).
 7. Dipstick tube (right side manifold).
 8. Heat stove pipe (right side manifold).
 9. Battery negative cable.

CYLINDER HEAD REPLACEMENT

 Remove or Disconnect
 1. Intake manifold, as outlined previously.
 2. Generator, and lay aside (right cylinder head).
 3. AIR pump and generator/AIR pump brackets (right cylinder head on TBI engines).
 4. Exhaust manifold, as outlined previously.
 5. Air conditioning compressor and front bracket (if equipped). Lay the compressor aside.
 6. Rocker arm cover, as outlined previously.
 7. Spark plugs.
 8. AIR pipe bolts at rear of cylinder head (TBI engines).
   Push the pipe out of the way.
 9. Ground strap at the rear of the cylinder head.
 10. Sensor wire at the cylinder head.
 11. Pushrods, as outlined previously.
 12. Cylinder head bolts.
 13. Cylinder head.
 14. Head gasket.

 Clean
 — Carbon deposits from combustion chambers.
 — All traces of old head gasket from cylinder head and block.
 — Cylinder head bolt threads and threads in the block.

 Inspect
 • Sealing surfaces of the block and cylinder head for nicks, heavy scratches, or other damage.

 Cylinder Head Repair
 • Refer to the proper Unit Repair Manual.

 Install or Connect (Figure 9)
 1. Head gasket.
   • If a steel gasket is used, coat both sides of the gasket with sealer. Spread the sealer thin and even.
   • Do not use sealer on composition steel-asbestos gaskets.
   • Place the gasket over the block dowel pins with the bead up.
 2. Cylinder head. Carefully guide the cylinder head into place over the dowel pins and gasket.
3. Cylinder head bolts. Coat threads of the cylinder head bolts with sealing compound (GM part number 1052080 or equivalent) and install finger-tight.

Tighten
- Cylinder head bolts, a little at a time, using the sequence shown in figure 9. Proper torque is 110 N·m (80 ft. lbs.).

4. Pushrods, as outlined previously.

Adjust
- Valves, as outlined previously.

5. Sensor wire.

6. Ground strap at the rear of the cylinder head.

7. AIR pipe to the rear of the cylinder head (TBI engines).

8. Rocker arm cover, as outlined previously.

10. Air conditioning compressor and front bracket (if equipped).

11. Exhaust manifold, as outlined previously.

12. AIR pump and generator/AIR pump brackets (right cylinder head on TBI engines).

13. Generator (right cylinder head).

14. Intake manifold, as outlined previously.

TORSIONAL DAMPER AND FRONT CRANKSHAFT SEAL REPLACEMENT

Remove or Disconnect (Figure 10)

Tool Required:
- J-23523-E Torsional Damper Puller and Installer

1. Battery negative cable.

2. Fan belts, fan, and pulley.

3. Fan shroud assembly.

4. Accessory drive pulley.

5. Torsional damper bolt.

Install or Connect (Figures 11 and 12)

Tools Required:
- J-22102 Seal Installer
- J-23523-E Torsional Damper Puller and Installer

1. Crankshaft key, if removed.

2. Front crankshaft seal. Use J-22102 (figure 11). The open end of the seal faces inside the engine. Coat the seal lips with engine oil.
NOTICE: The inertia weight section of the torsional damper is assembled to the hub with a rubber type material. The correct installation procedures (with the proper tool) must be followed or movement of the inertia weight section of the hub will destroy the tuning of the torsional damper.

3. Stud (item A, figure 12) to the crankshaft. Thread the stud fully into the tapped hole in the crankshaft.
4. Torsional damper over the end of the stud. Align the keyway in the torsional damper shaft with the crankshaft key.
   - Use a small amount of RTV sealer to seal the crankshaft key to crankshaft joint.
5. Bearing, washer and nut (figure 12).
   - Turn the nut to pull the vibration damper into place.
   - Remove the tool.
6. Torsional damper bolt and washer.
   - Bolt to 115 N·m (85 ft. lbs.).
7. Accessory drive pulley.
8. Fan shroud assembly.
10. Battery negative cable.

**FRONT COVER REPLACEMENT**

**Remove or Disconnect (Figure 13)**
1. Battery negative cable.
2. Water pump. Refer to ENGINE COOLING (SEC. 6B).
3. Torsional damper, as outlined previously.
4. Oil pan to front cover bolts.
5. Front cover to block bolts.
6. Front cover.
   - Pull the cover forward enough to permit cutting of the front oil pan seal (figure 13).
1. Oil pan bolts, timing marker (if used), clips, and reinforcements.
2. Oil pan.
3. Gaskets and seals.

NOTICE: Oil pressure line must be removed from the side of the block to prevent crushing of the line when the engine is raised.

8. Oil pressure line from the side of the block.

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

- Support the engine with a suitable lifting fixture.
- Raise the engine only enough to permit oil pan removal.
- Oil pan bolts, timing marker (if used), clips, and reinforcements.
- Oil pan.
- Gaskets and seals.
Clean
- Gasket surfaces on the engine and oil pan.

Install or Connect (Figure 17)
- Apply RTV sealer to the front and rear corners of the gaskets (74).
  1. Gaskets (74) to the block. Use gasket sealer to hold them in place.
  2. Rear oil pan seal (76) to the groove in the rear main bearing cap, with the ends mating against the gaskets (74).
  3. Front oil pan seal (78). Press the locating tips into the holes in the front cover. The ends should mate against the gaskets (74).
  4. Oil pan.
  5. Oil pan bolts, timing marker (if used), clips, and reinforcements.

Tighten
- Oil pan to front cover bolts to 7.9 Nm (70 in. lbs.).
- Oil pan to block bolts to 18.1 Nm (160 in. lbs.).
- Lower the engine.

NOTICE: See "Notice" on page 6A5–1 of this section.

6. Engine mounting through bolts.

Tighten
- Through-bolts to specifications. Refer to figures 35, 36, and 37.

7. Oil pressure line.
8. Oil filter.
9. Torque converter or clutch cover.
10. Starter (if removed).
- Lower the vehicle.
11. Distributor cap.
12. Air cleaner.
14. Proper quantity and grade of engine oil.
15. Battery negative cable.

OIL PUMP REPLACEMENT

Remove or Disconnect
1. Oil pan, as outlined previously.
2. Oil pump to main bearing cup bolt.
3. Oil pump.

Inspect
- Oil pump pickup tube for damage and looseness. If the tube is loose or damaged, replace it as outlined in the proper unit repair manual.

Oil Pump Repair
- Refer to the proper unit repair manual.

Install or Connect
1. Oil pump to the engine. Align the slot in the oil pump shaft with the tang on the distributor shaft. The oil pump should slide easily into place. No gasket is used.
2. Oil pump to main bearing cap bolt.

Tighten
- Oil pump bolt to 90 Nm (65 ft. lbs.).

3. Oil pan, as outlined previously.

REAR CRANKSHAFT OIL SEAL REPLACEMENT

The rear main bearing oil seal can be replaced (both halves) without removal of the crankshaft. Always replace the upper and lower seal as a unit. Install the seal with the lip facing the front of the engine. Extreme care should be exercised when installing this seal to protect the sealing bead located in the channel on the outside diameter of the seal. An installation tool should be used to protect the seal bead when positioning the seal. (Some seal kits include the tool as part of the service kit).

Remove or Disconnect (Figures 18 and 19)
1. Oil pan and oil pump, as outlined previously.
2. Rear main bearing cap.
3. Lower seal half (figure 18).
4. Upper seal half (figure 19).
- Tap on the upper seal half, using a small drift and hammer.
- Remove the upper seal half, using pliers.

Clean
- Sealing surfaces of the main bearing cap and block.

Inspect
- Crankshaft, seal channel, and sealing surfaces for nicks, scratches, etc.
Install or Connect (Figures 20, 21, and 22)

1. Upper seal half.

Important

- An oil seal installation tool (figure 20) should be fabricated (if not provided in the seal kit) to prevent seal damage during installation. Extreme care should be taken when installing this seal to protect the sealing bead located in the channel on the outside diameter of the seal.
- Coat the seal lips lightly with engine oil. Keep the oil off of the seal mating ends.
- Position the tip of the tool between the crankshaft and the seal seat in the block (figure 21).

Figure 21—Installing the Rear Crankshaft Oil Seal

Figure 22—Applying Sealer to the Block
• Position the seal half between the crankshaft and the tip of the tool. Make sure that the oil seal lip is positioned toward the front of the engine.

• Roll the seal around the crankshaft using the tool as a “shoe-horn” to protect the seal bead from the sharp corner of the seal seat surface in the block. The installation tool must remain in position until the seal half is properly positioned with both ends flush with the block.

• Remove the tool, being careful not to withdraw the seal half.

2. Lower seal half.

2. Lower seal half.

• Coat the seal lips lightly with engine oil. Keep the oil off of the seal mating ends.

• Insert the seal half into the rear main bearing cap. Use the tool to protect the seal half from the sharp edge of the seal seat. Feed the seal half into the rear main bearing cap, using light finger pressure. Make sure the oil seal lip faces the front of the engine (figure 21).

3. Rear main bearing cap with the lower main bearing.

3. Rear main bearing cap with the lower main bearing.

• Apply a brush-on type oil sealing compound to the mating surface of the block and cap (figure 22). Do not allow any sealant on either crankshaft or rear oil seal.

• Apply engine oil to the lower main bearing.

• Position the cap to the block. Install the cap bolts.

   **Tighten**
   • Rear main bearing cap bolts temporarily to 14 N·m (10 ft. lbs.).

• Tap the end of the crankshaft first rearward then forward with a lead hammer. This will line up the rear main bearing and crankshaft thrust surfaces.

   **Tighten**
   • Rear main bearing cap bolts to 150 N·m (110 ft. lbs.).

4. Oil pan and oil pump, as outlined previously.

5. The proper quantity and grade of engine oil.

## MEASURING CAMSHAFT LOBE LIFT

### Tools Required:

- J-8520 Camshaft Lobe Lift Indicator

1. Remove the rocker arm as outlined previously.

2. Refer to figure 23. Position the dial indicator (part of J-8520) so the plunger rests on the pushrod end, as shown. Make sure the pushrod is in the lifter socket.

3. Rotate the crankshaft slowly in the direction of rotation until the lifter is on the heel of the cam lobe. At this point, the pushrod will be in its lowest position.

4. Set dial indicator on zero, then rotate the crankshaft slowly, or attach an auxiliary starter switch and “bump” the engine over, until the pushrod is in fully raised position.

### Important

- Whenever the engine is cranked remotely at the starter, with a special jumper cable or other means, the primary leads should be disconnected from the distributor or ignition coil.

5. Compare the total lift recorded from the dial indicator with specifications.

6. If camshaft readings for all lobes are within specifications, remove dial indicator assembly.

7. Install the rocker arm and adjust the valves as previously outlined.

## CAMSHAFT REPLACEMENT

### Remove or Disconnect (Figures 24, 25, and 26)

- **Tool Required:**
  - J-1619 Crankshaft Sprocket Puller

1. Battery negative cable.
Figure 25—Replacing the Crankshaft Sprocket

2. Air cleaner.
4. Air conditioning condensor from its mounting and swing it forward.
5. Fan, shroud, and radiator. Refer to ENGINE COOLING (SEC. 6B1) and RADIATOR (SEC. 6B2).
6. Generator and bracket.
7. Rocker arm covers, as outlined previously.
9. Water pump. Refer to ENGINE COOLING (SEC. 6B1).
10. Torsional damper, as outlined previously.
11. Front cover, as outlined previously.
12. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
13. Intake manifold, as outlined previously.
14. Pushrods and hydraulic lifters, as outlined previously.
15. Fuel pump and pushrod (carbureted engines).
   • Align the timing marks (figure 24).

Figure 26—Replacing the Camshaft

17. Camshaft sprocket and timing chain. The sprocket is a light interference fit on the camshaft. Tap the sprocket on its lower edge to loosen it.
   • Install two or three \( \frac{9}{16} \)-18 bolts 100-125 mm (4-5 inches) long into the camshaft threaded holes. Use these bolts to handle the camshaft (figure 26).
   • Pull the camshaft from the block. Use care to prevent damage to the camshaft bearings.

Cleaning Inspection and Repair
Clean, inspect and repair or replace the camshaft and related components, as outlined in the proper unit repair manual.
The unit repair manual also describes camshaft bearing replacement.

Install or Connect (Figures 24, 25, and 26)

Tool Required:
J-22102 Crankshaft Sprocket Installer

• Coat the camshaft lobes and journals with a high quality engine oil supplement (GM Engine Oil Supplement or equivalent).
1. Two or three \( \frac{9}{16} \)-18 bolts 100-125 mm (4-5 inches) long into the camshaft threaded holes. Use these bolts to handle the camshaft.
2. Camshaft to the engine (figure 26). Handle the camshaft carefully to prevent damage to the camshaft bearings.
4. Camshaft sprocket and timing chain.
   - **Important**
     - Line up the timing marks on the camshaft sprocket and crankshaft sprocket (figure 24).
5. Camshaft sprocket bolts.
   - **Tighten**
     - Bolts to 27 N·m (20 ft. lbs.).
6. Fuel pump and pushrod (carbureted engines).
7. Hydraulic lifters and pushrods, as outlined previously.
   - **Important**
     - Replace all hydraulic lifters, crankcase oil and filter, and add GM Engine Oil Supplement (or equivalent) to the engine oil whenever a new camshaft is installed.
   - **Adjust**
     - Valves, as outlined previously.
8. Intake manifold, as outlined previously.
9. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
10. Front cover, as outlined previously.
11. Torsional damper, as outlined previously.
12. Water pump. Refer to ENGINE COOLING (SEC. 6B1).
14. Rocker arm covers, as outlined previously.
15. Generator and bracket.
16. Fan, shroud, and radiator. Refer to ENGINE COOLING (SEC. 6B1) and RADIATOR (SEC. 6B2).
17. Air conditioning condensor.
18. Grille.
19. Air cleaner.
20. Battery negative cable.
   - Fill the cooling system with the proper quantity and grade of coolant.

**CONNECTING ROD AND PISTON REPLACEMENT**

**Remove or Disconnect (Figure 27)**

Tool Required:
J-5239 Guide Set

1. Cylinder head, as outlined previously.
2. Oil pan, as outlined previously.
3. Oil pump, as outlined previously (if necessary).
4. Ridge or deposits from the upper end of the cylinder bores.
   - Turn the crankshaft until the piston is at BDC.
   - Place a cloth on top of the piston.
   - Perform the cutting operation with a ridge reamer.
   - Turn the crankshaft until the piston is at TDC.
   - Remove the cloth and cuttings.

**Install or Connect (Figures 27 through 31)**

Tools Required:
J-5239 Connecting Rod Guide Set
J-8037 Ring Compressor

- Make sure the cylinder walls are clean. Lubricate the cylinder wall lightly with engine oil.
- Make sure the piston is installed in the matching cylinder for which it was fitted. Used pistons must be installed in the cylinder they were removed from.
1. Connecting rod bearings.
Figure 28—Ring End Gap Location

- Be certain that the bearings are of the proper size.
- Install the bearings in the connecting rod and connecting rod cap.
- Lubricate the bearings with engine oil.

2. Piston and connecting rod to the proper bore.
   - With the connecting rod cap removed, install J-5239 onto the connecting rod studs.
   - Locate the piston ring end gaps as shown in figure 28. Lubricate the piston and rings with engine oil.
   - Without disturbing the ring end gap location, install J-8037 over the piston (figure 29).
   - The piston must be installed so that the valve clearance notches are towards the center of the engine (figure 30).
   - Place the piston in its matching bore. Using light blows with a hammer handle, tap the piston down into its bore (figure 29). At the same time, from beneath the vehicle guide the connecting rod to the crankpin with J-5239 (figure 27). Hold the ring compressor against the block until all rings have entered the cylinder bore.
   - Remove J-5239 from the connecting rod bolts.

**Important**

- Each connecting rod and bearing cap should be marked, beginning at the front of the engine. Cylinders 1, 3, 5 and 7 are the left bank and 2, 4, 6 and 8 are the right bank. The numbers on the connecting rod and bearing cap must be on the same side when installed in the cylinder bore. If a connecting rod is ever transposed from one block or cylinder to another, new connecting rod and bearings should be fitted and the connecting rod should be numbered to correspond with the new cylinder number.

**Measure**

- Connecting rod bearing clearance. Refer to the proper unit repair manual.

Figure 29—Installing the Piston

3. Connecting rod cap and bearing.
4. Connecting rod cap nuts.

**Tighten**

- Connecting rod cap nuts to 66 N·m (48 ft. lbs.).

**Measure**

- Connecting rod side clearance. Use a feeler gage between the connecting rod and crankshaft (figure 31). The correct clearance is 0.013–0.023–inch.
5. Oil pump (if removed), as outlined previously.
6. Oil pan and cylinder head, as outlined previously.

OIL FILTER BYPASS VALVE

Remove or Disconnect (Figure 32)

1. Oil filter.

Inspect
- Bypass valve spring and valve disc for proper operation, cracks, and damage. If replacement is needed, the oil filter bypass valve (93) must be replaced, as follows:

2. Bolts (94).
3. Oil filter bypass valve.

Clean
- Valve chamber in the block.

Install or Connect (Figure 32)

1. Oil filter bypass valve (93).
2. Bolts (94).

MAIN BEARING REPLACEMENT

Remove or Disconnect (Figure 33)

Tool Required:
J-8080 Main Bearing Remover/Installer

1. Spark plugs.
2. Oil pan, as outlined previously.
3. Oil pump, as outlined previously.
4. Main bearing caps.
   - Check the main bearing caps for location markings. Mark the caps if necessary. The caps must be returned to their original locations during assembly.
5. Lower main bearing inserts from the main bearing caps.
6. Rear crankshaft oil seal, if necessary, as outlined previously.
8. Upper main bearing inserts.
   - Insert J-8080 into the crankshaft oil hole (figure 33).
   - Rotate the crankshaft to “turn” the bearing insert out of the block.

Cleaning, Inspection, and Repair
Clean, inspect, and repair or replace the components as required. Refer to the proper unit repair manual. The unit repair manual contains information on:
- Crankshaft.
- Main and connecting rod bearings.
- Main bearing cap replacement (shimming procedure).

Install or Connect (Figures 22, 33, and 34)

Tool Required:
J-8080 Main Bearing Remover/Installer

1. Upper main bearing inserts.
• Insert tool J-8080 into a crankshaft main bearing oil hole (figure 33).
• Apply engine oil to inserts of the proper size.
• Insert the plain end (without the bearing tang) of the insert between the crankshaft and the notched side of the block.
• Rotate the crankshaft to "roll" the insert into the block.
• Remove the tool.

2. Lower main bearing inserts to the main bearing caps.
   • Make sure the inserts are of the proper size.
   • Apply engine oil to the inserts.

3. Main bearing caps (except rear cap) and bolts to the block.

   Measure
   • Main bearing clearance. Refer to the proper unit repair manual. If the engine is in the vehicle, the crankshaft must be supported upward to remove any clearance from the upper bearing. The total clearance can then be measured between the lower bearing and journal.

4. Rear crankshaft oil seal to the block and main bearing cap, as outlined previously.

5. Rear main bearing cap.
   • Apply a brush-on type oil sealing compound to the mating surface of the block and cap (figure 22). Do not allow any sealant on either crankshaft or rear oil seal.
   • Apply engine oil to the bearing insert.
   • Install the rear main bearing cap and bolts. Tighten the bolts temporarily to 14 N·m (10 ft. lbs.).

   Measure
   • Crankshaft end play, as follows:
     - Tap the end of the crankshaft first rearward then forward with a lead hammer. This will line up the rear main bearing and crankshaft thrust surfaces.
     - Tighten the rear main bearing cap bolts to 150 N·m (110 ft. lbs.).
     - With the crankshaft forced forward, measure at the front end of the rear main bearing with a feeler gage (figure 34). The proper clearance is 0.006-0.010-inch.

6. Oil pump, as outlined previously.
7. Oil pan, as outlined previously.
8. Spark plugs.

CRANKSHAFT REPLACEMENT

1. Remove the engine, as outlined later.
2. Refer to the proper unit repair manual for crankshaft replacement procedures.

FLYWHEEL REPLACEMENT

1. Transmission, flywheel housing, and clutch.
2. Flywheel bolts.
3. Flywheel.

Clean
• Mating surfaces of crankshaft and flywheel. Remove any burrs.

Inspect
— Flywheel for burning, scoring, warping, and wear. Replace the flywheel if necessary. Do not machine the flywheel.
— Flywheel ring gear for worn or broken teeth.

Flywheel Ring Gear Replacement
1. Use a torch to heat the gear around the entire circumference, then drive the gear off the flywheel, using care not to damage the flywheel.

NOTICE: Never heat starter gear to red heat as this will change metal structure.

2. Uniformly heat the flywheel gear to temperature which will expand the gear to permit installation. Temperature must not exceed 200°C (400°F).
3. As soon as the gear has been heated, install on the flywheel.

Install or Connect
1. Flywheel.
2. Flywheel bolts.

Tighten
• Flywheel bolts to 90 N·m (65 ft. lbs.).
3. Clutch, flywheel housing, and transmission.
ENGINE MOUNTINGS

NOTICE: Broken or deteriorated mountings can cause misaligned and eventual destruction of certain drive train components. When a single mounting breakage occurs, the remaining mountings are subjected to abnormally high stresses.

INSPECTING ENGINE MOUNTINGS

Front Engine Mountings

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

1. Raise the engine to remove weight from the mountings and to place a slight tension on the rubber cushion. Observe both mountings while raising the engine.
2. Replace the mounting if the following conditions exist:
   - Hard rubber surface covered with heat check cracks.
   - Rubber cushion separated from the metal plate of the mounting.
   - Rubber cushion split through the center.
3. If there is movement between a metal plate of the mounting and its attaching points, lower the engine and tighten the bolts or nuts attaching the mounting to the engine, frame, or bracket.

Rear Mountings

1. Push up and pull down on the transmission tailshaft. Observe the transmission mounting.
2. Replace the mounting if the following conditions exist:
   - Mounting bottomed out (tailshaft can be moved up but not down).
3. If there is relative movement between a metal plate of the mounting and its attaching point, tighten the bolts or nuts attaching the mounting to the transmission or crossmember.

FRONT MOUNTING REPLACEMENT

Remove or Disconnect (Figures 35, 36, and 37)

1. Battery negative cable.

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

• Support the engine with a suitable jack. Do not load the engine mounting.

2. Engine mounting through-bolt and nut.

NOTICE: Raise the engine only enough for sufficient clearance. Check for interference between the rear of the engine and the dash panel which could cause distributor damage.

• Raise the engine only enough to permit removal of the engine mounting.
3. Mounting assembly bolts, nuts, and washers.

Install or Connect (Figures 35, 36, and 37)

1. Mounting assembly.

NOTICE: See "Notice" on page 6A5-1 of this section.

2. Mounting assembly bolts, nuts, and washers.

Tighten

• Fasteners to specifications. Refer to figures 35, 36, and 37.

3. Engine mount through-bolt and nut. Lower the engine until the bolt can be inserted. Install the nut.

Tighten

• Through-bolt nut to specifications. Refer to figures 35, 36, and 37.

4. Battery negative cable.

REAR MOUNTING REPLACEMENT

(EXCEPT P-MODELS WITH FLYWHEEL HOUSING MOUNTING)

Remove or Disconnect (Figures 38, 39, and 40)

1. Battery negative cable.

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

• Support the rear of the engine to relieve the weight on the rear mountings.
2. Mounting to crossmember nut(s) and washer(s).
3. Mounting to transmission bolts and washers.

• Raise the rear of the engine only enough to permit removal of the mounting.

Install or Connect (Figures 38, 39, and 40)

1. Mounting.

• Lower the rear of the engine.
2. Mounting to transmission bolts and washers.

NOTICE: See "Notice" on page 6A5-1 of this section.

3. Mounting to crossmember nut(s) and washer(s).

SECTION 6A6

6.2L DIESEL

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology "NOTICE: See 'Notice' on page 6A6-1 of this section."

NOTICE: All engine fasteners are important attaching parts in that they could affect the performance of vital components and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of this part.

Figure 1—Lubrication Diagram

6.2 L diesel engines are 90 degree V8 type, naturally aspirated, with indirect type combustion chambers. The crankshaft is supported by five precision insert main bearings, with crankshaft thrust taken at the number three (center) main bearing.

The camshaft is supported by five plain type bearings and is chain driven. Motion from the camshaft is transmitted to the overhead valves by roller type hydraulic lifters, pushrods, and spindle mounted rocker arms. The valve guides are integral in the cylinder head.

The connecting rods are forged steel, with precision insert type crankpin bearings. The piston pins are retained by snap rings.

ENGINE LUBRICATION

A lubrication schematic is shown in figure 1. The gear type oil pump is driven from either the vacuum pump shaft or from a drive gear, depending on engine application. The vacuum pump or drive gear is driven by the camshaft. Oil is drawn into the pump through a pickup screen and pipe.

Pressurized oil is routed to the oil cooler, located in the radiator. A bypass valve is provided should the oil cooler become restricted. Oil flows from the cooler to a full flow oil filter. An oil filter bypass valve is provided should the oil filter become restricted.

Oil flows from the oil filter to the oil galleries, providing pressurized lubrication to various components.

The hydraulic valve lifters receive oil from the oil galleries. Oil flows from the hydraulic lifters through hollow pushrods to the rocker arms. Oil from the overhead drains back to the crankcase through oil drain holes.

The pistons, piston rings, cylinder walls, and connecting rod small end bearing are lubricated by oil splash.
ON-VEHICLE SERVICE

INTAKE MANIFOLD REPLACEMENT

Remove or Disconnect

Tool Required:
- J-29664 Manifold Cover Set
1. Battery cables.
2. Engine cover (G models).
3. Air cleaner.
4. EGR/EPR solenoids with bracket from the intake manifold studs.
5. CDR valve (G models).
6. EGR and crankcase ventilation hoses.
7. Rear air conditioning compressor bracket (if equipped).
8. Fuel line bracket and ground strap.
9. Fuel filter bracket at the intake manifold (G models).
10. Intake manifold bolts and fuel line clips. On models with gear driven vacuum pumps, it may be necessary to loosen the vacuum pump clamp bolt and turn the pump to provide access to an intake manifold bolt.
11. Intake manifold and gasket.

Important
- If any further service work is to be done, cover the intake ports with J-29664-1.

Clean
- Gasket surfaces on intake manifold and cylinder heads.

Install or Connect (Figure 2)

1. New gaskets. Be sure to use the correct gasket. The gaskets for light duty emissions models have openings for the EGR ports, the gaskets for heavy duty emissions models do not.
2. Intake manifold.
3. Intake manifold bolts and fuel line clips.
   • Intake manifold bolts to 42 N·m (32 ft. lbs.). Use the tightening sequence shown in figure 2.
   • Rotate the vacuum pump to the proper position and tighten the clamp bolt (gear driven vacuum pumps).
4. Fuel filter bracket (G models).
5. Fuel line bracket and ground strap.
6. Rear air conditioning compressor bracket (if equipped).
7. EGR and crankcase ventilation hoses.
8. CDR valve (G models).
9. EGR/EPR solenoids with bracket.
10. Air cleaner.
11. Engine cover (G models).

EXHAUST MANIFOLD REPLACEMENT

R AND V MODELS (RIGHT SIDE)

Remove or Disconnect

1. Battery cables.
   • Raise the vehicle. Support with suitable safety stands.
2. Exhaust pipe from the manifold.
   • Lower the vehicle.
4. Air cleaner duct bracket.
5. Glow plugs.

Clean
- Sealing surfaces on exhaust manifold and cylinder head.

- Figure 2—Intake Manifold
6A6-4 6.2 L DIESEL

— Threads on manifold bolts.

**Install or Connect**

1. Exhaust manifold and bolts.

**Tighten**

- Bolts to 35 N·m (26 ft. lbs.).

2. Glow plugs.
3. Air cleaner duct bracket.

- Raise the vehicle. Support with suitable safety stands.

5. Exhaust pipe to the manifold.

- Lower the vehicle.

R AND V MODELS (LEFT SIDE)

**Remove or Disconnect**

1. Battery cables.
2. Dipstick tube.
4. Air conditioning compressor rear bracket (if equipped).
5. Exhaust manifold bolts.

- Raise the vehicle. Support with suitable safety stands.

6. Exhaust pipe at the manifold.
7. Exhaust manifold, from below the vehicle.

— Sealing surfaces on the exhaust manifold and cylinder head.
— Threads on the exhaust manifold bolts.

**Install or Connect**

1. Exhaust manifold, from below the vehicle. Loosely install two or three bolts to hold the manifold in place.

2. Exhaust pipe to the manifold.

- Lower the vehicle.

3. Remaining exhaust manifold bolts and air conditioning compressor rear bracket (if used).

**Tighten**

- Bolts to 35 N·m (26 ft. lbs.).

5. Dipstick tube.

G MODELS (BOTH SIDES)

**Remove or Disconnect**

1. Battery cables.
- Raise the vehicle. Support with suitable safety stands.

2. Exhaust pipe at the manifold.

- Lower the vehicle.

3. Engine cover.
5. Air conditioning compressor rear bracket (if equipped) (left side exhaust manifold).

**Clean**

— Sealing surfaces on the exhaust manifold and cylinder head.
— Threads on the manifold bolts.

**Install or Connect**

1. Exhaust manifold.
2. Exhaust manifold bolts and air conditioning compressor rear bracket (if equipped) (left side exhaust manifold).

**Tighten**

- Bolts to 35 N·m (26 ft. lbs.).

4. Engine cover.

- Raise the vehicle. Support with suitable safety stands.

5. Exhaust pipe to the manifold.
6. Lower the vehicle.
7. Battery cables.

ROCKER ARM COVER REPLACEMENT

R AND V MODELS (BOTH SIDES)

G MODELS (RIGHT SIDE)

**Remove or Disconnect**

1. Intake manifold, as outlined previously.
2. Fuel injection lines. Refer to DIESEL FUEL INJECTION (SEC. 6C2). (Injection lines for #5 and #7 cylinders do not have to be removed for right side rocker arm cover replacement).
3. Glow plug wires (G models).
4. Wiring harness from wiring harness clip.
5. Wiring harness bracket (left rocker arm cover).
6. Rocker arm cover bolts.

**NOTICE:** Do not pry on the rocker arm cover. Damage to sealing surfaces may result.

7. Rocker arm cover.

**Clean**

1. RTV from the rocker arm cover and cylinder head. All loose RTV, or pieces that will cause installation interference, must be removed.
2. Oil and grease from the sealing surfaces on the rocker arm cover and cylinder head. Use a suitable solvent.

**Inspect**

- Rocker arm cover sealing flanges for distortion. Replace as necessary.

**Install or Connect (Figure 3)**

**NOTICE:** Do not allow RTV sealant into the rocker arm cover bolt holes. This may cause a "hydraulic lock" condition when the bolts are tightened, damaging the cylinder head casting.

- Apply a 5 mm (5/32-inch) bead of RTV sealant (GM
Figure 3—Applying Sealant to the Rocker Arm Cover

part number 1052915 or equivalent) to the cylinder head, inboard of the bolt holes. Refer to figure 3. The sealer must be wet to the touch when the bolts are torqued.

1. Rocker arm cover.
2. Rocker arm cover bolts.

Tighten
- Bolts to 22 N·m (16 ft. lbs.).
3. Wiring harness bracket.
4. Wiring harness to the wiring harness clip.
5. Glow plug wires (G models).
6. Fuel injection lines. Refer to DIESEL FUEL INJECTION (SEC. 6C2).
7. Intake manifold, as outlined previously.

G MODELS (LEFT SIDE)

Remove or Disconnect
1. Intake manifold, as outlined previously.
2. Fuel injection lines. Refer to DIESEL FUEL INJECTION (SEC. 6C2).
3. Upper fan shroud (vehicles with air conditioning).
4. Air conditioning compressor belt (if equipped).
5. Left exhaust manifold, as outlined previously (vehicles with air conditioning).
6. Air conditioning compressor (if equipped). Refer to AIR CONDITIONING (SEC. 1B).
7. Dipstick tube front bracket from stud.
8. Wiring harness brackets.
9. Rocker arm cover bolts and fuel return bracket.

NOTICE: Do not pry on the rocker arm cover. Damage to the sealing surfaces may result.

Install or Connect (Figures 4 and 6)

1. Rocker arm cover, to the rocker arm shaft. One type of rocker arm is used at all locations.
17. Hydraulic Lifter
18. Pushrod
30. Bolt
31. Rocker Arm Assembly
32. Clamp
33. Guide Plate

**Important**
- Lubricate the rocker arms with engine oil before installing.

2. Rocker arm retainers.
- Center the rocker arms on the corresponding holes in the rocker arm shaft.
- Install new retainers. Use a drift of at least 13 mm (1/2-inch) diameter.

**NOTICE:** The pushrods must be installed with the marked or painted end up. Failure to do so may result in damage or premature wear.

3. Pushrods, with the painted or marked end up.
4. Rocker arm shaft assembly. Make sure the ball ends of the pushrods seat in the rocker arms.

**NOTICE:** Improper installation of the rocker arm shaft bolts may cause rocker arm shaft breakage and/or piston to valve contact.

5. Rocker arm shaft bolts.
- Rotate the engine until the mark on the torsional damper aligns with the “0” mark on the timing tab.

- Rotate the engine counterclockwise 88 mm (31/2-inches), measured at the torsional damper. This measurement can be estimated by aligning the torsional damper mark with the first lower water pump bolt (figure 6). This procedure will position the engine so no valves are close to a piston crown.
- Install both bolts snug on the shaft.

**Tighten**
- Bolts alternately to 55 N·m (40 ft. lbs.).

6. Rocker arm cover, as outlined previously.

**HYDRAULIC LIFTER REPLACEMENT**

**Remove or Disconnect (Figures 4 and 7)**

**Tool Required:**
- J-29834 Hydraulic Lifter Remover (R and V Models)

1. Rocker arm covers, as outlined previously.
2. Rocker arm shaft with rocker arms and pushrods, as outlined previously.

**Important**
- Rocker arm assemblies and pushrods must be marked for proper assembly, as outlined previously.

3. Cylinder head, as outlined later (G models).
5. Guide plates (33). Use mechanical fingers, if necessary.
6. Hydraulic lifters, through the access hole in the cylinder head. On R and V Models, use J-29834 (figure 7) and a magnet. Place the lifters in an organizer rack. The lifters must be installed in the same bore from which they were removed.
Inspect
- Hydraulic lifter body for scuffing and scoring. Replace the lifter if present.
- Roller for looseness and excessive play. Check for missing or broken needle bearings. Replace if necessary.
- Roller surface for pits and roughness. If present, the mating camshaft lobe should also be checked. If the lobe is pitted or rough, replace both camshaft and lifter.

Hydraulic Lifter Repair
- Refer to the proper unit repair manual.

Important
- Some engines will have both standard and 0.010-inch oversize hydraulic lifters. The oversize lifter will have a "10" etched on the side. The block will be stamped "O.S." on the cast pad adjacent to the lifter bore and on the top rail of the cylinder case above the lifter bore.

Install or Connect (Figure 4)

NOTICE: New hydraulic lifters must be primed before installation. Damage to the lifters may result if dry when the engine is started.

1. Hydraulic lifters to the engine. On R and V models, fabricate an installation tool from mechanic's wire.

2. Guide plates (33).
3. Clamps (32).

Tighten
- Clamp bolt to 26 N·m (18 ft. lbs.).

Important
- Prime new hydraulic lifters before installation by working the lifter plunger while submerged in clean kerosene or diesel fuel.
- Coat the lifter roller and bearings with lubricant (GM part number 1052365 or equivalent).
- Lifters MUST be installed in their original locations.

4. Cylinder head, as outlined later (G models).
5. Rocker arm shaft with rocker arms and pushrods, in their original locations, as outlined previously. Hardened ends of the pushrods must face up.
6. Rocker arm covers, as outlined previously.
VALVE STEM SEAL AND VALVE SPRING REPLACEMENT

Remove or Disconnect (Figures 8 and 9)

Tools Required:
- J-29666 Air Line Adapter
- J-26513-A Valve Spring Compressor

1. Rocker arm covers, as outlined previously.

2. Rocker arm shaft with rocker arms, as outlined previously. Mark the assemblies so they can be returned to their original locations.

4. Valve keepers.
   - Rotate the engine until the piston for the cylinder being serviced is at TDC.
   - Install J-29666 into the glow plug hole.
   - Apply compressed air to hold the valves in place.
   - Use J-26513-A to compress the valve spring (figure 9). If the spring will not compress, tap on the tool lightly with a mallet to break the cap or rotator loose from the valve keepers.
   - Remove the valve keepers.
   - Carefully release spring tension. Remove J-26513-A.

5. Cap or rotator, shield, and valve spring with damper.

6. Valve seal.

Install or Connect (Figures 8 and 9)

Tools Required:
- J-29666 Air Line Adaptor
- J-26513-A Valve Spring Compressor

1. New valve seal.

2. Valve spring with damper, shield and cap or rotator.

3. Valve keepers.
   - With air pressure applied to the cylinder with J-29666, compress the valve spring with J-26513-A (figure 9).
   - Install the valve keepers. Use grease to hold them in place.
   - Carefully release spring pressure. Make sure the valve keepers stay in place.
   - Remove J-26513-A and J-29666.

5. Glow plugs.

6. Rocker arm shaft with rocker arms, as outlined previously.

7. Rocker arm covers, as outlined previously.
Cylinder Head Replacement

Removal (R and V Models) (Both Sides)

Remove or Disconnect

1. Intake manifold, as outlined previously.
2. Injection lines. Refer to Diesel Fuel Injection (Sec. 6C2).
3. Rocker arm covers, as outlined previously.
   - Drain the cooling system.
4. Dipstick tube (left cylinder head).
5. Ground wire at the cowl (right cylinder head).
6. Glow plug relay (left cylinder head).
   - Raise the vehicle. Support with suitable safety stands.
7. Exhaust pipe from the manifold.
   - Lower the vehicle.
8. Air conditioning compressor (if equipped) and lay aside (left cylinder head).
9. Generator, and lay aside (right cylinder head).
10. Glow plug wires.
12. Rocker arm assemblies and pushrods, as outlined previously.

Important
- Rocker arm assemblies and pushrods must be marked for proper assembly, as outlined previously.

13. Radiator, bypass and heater hoses.
15. Water crossover pipe/thermostat housing assembly.
16. Cylinder head bolts. Rear bolt in left cylinder head may have to remain in the head during removal.
17. Cylinder head.

Removal (G Models) (Left Side)

Remove or Disconnect

1. Intake manifold, as outlined previously.
2. Injection lines at the injection pump. Refer to Diesel Fuel Injection (Sec. 6C2).
3. Transducer (cruise control equipped vehicles).
4. Upper fan shroud and air conditioning compressor belt (vehicles with air conditioning).
   - Raise the vehicle. Support with suitable safety stands.
5. Left exhaust manifold, as outlined previously.
6. Power steering pump lower adjusting bolts.
7. Glow plug wires.
9. Injection lines. Refer to Diesel Fuel Injection (Sec. 6C2).
   - Lower the vehicle.
10. Air conditioning compressor (if equipped). Refer to Air Conditioning (Sec. 1B).
11. Upper power steering pump brackets. Lay the pump aside.
12. Dipstick tube front bracket from the stud.
15. Wiring harness bracket.
16. Vacuum line clip, at the cylinder head.
17. Fuel return line bracket.
18. Rocker arm assemblies and pushrods, as outlined previously.
19. Rocker arm cover, as outlined previously.
20. Air cleaner resonator and bracket.
21. Transmission dipstick tube at the front attaching stud and lay aside.
22. Generator upper bracket.
25. Cylinder head.

Removal (G Models) (Right Side)

Remove or Disconnect

1. Intake manifold, as outlined previously.
2. Injection lines. Refer to Diesel Fuel Injection (Sec. 6C2).
3. Transducer (cruise control equipped vehicles).
4. Upper fan shroud and air conditioning compressor belt (vehicles with air conditioning).
   - Raise the vehicle. Support with suitable safety stands.
5. Exhaust pipe at the manifold.
6. Rear air conditioning compressor bracket at the left exhaust manifold (if equipped).
7. Glow plug wires.
   - Lower the vehicle.
8. Air conditioning compressor (if equipped). Refer to Air Conditioning (Sec. 1B).
9. Dipstick tube front bracket from the stud.
10. Oil fill tube upper bracket.
11. Rocker arm cover, as outlined previously.
12. Rocker arm assemblies and pushrods, as outlined previously.

Important
- Rocker arm assemblies must be marked for proper assembly, as outlined previously.
   - Drain the cooling system.
13. Air cleaner resonator and bracket.
15. Heater, radiator and bypass hoses at the engine.
16. Generator upper bracket.
17. Water crossover pipe/thermostat assembly.
18. Cylinder head bolts.

Cleaning and Inspection

Clean
- Carbon deposits from combustion chambers.
- All traces of old head gasket from cylinder head and block. Use of a motorized wire brush is not recommended.
Cylinder head bolt threads using a wire brush.

Metal chips and dirt from the threads in the block.

Inspect

Cylinder head for cracks between the intake and exhaust ports. Use the magnaflux or dye method if available.

Sealing surfaces of the block and cylinder head for nicks, heavy scratches, or other damage.

Block for missing or damaged dowel pins, or dowel pins in the wrong location.

Measure

Cylinder head warpage. If warped more than 0.15 mm (0.006-inch) longitudinally or 0.08 mm (0.003-inch) transversely, replace the cylinder head. Resurfacing is not recommended.

Pre-chamber installed depth. The pre-chamber should be flush to a maximum of 0.05 mm (0.002-inch) protrusion.

• Make the measurement at two or more points on the pre-chamber where the prechamber seats on the head gasket shield and sealing ring.

• Measure the difference between the flat of the pre-chamber and the flat surface of the cylinder head.

• The pre-chamber must not protrude out of the cylinder head more than 0.05 mm (0.002-inch).

• The pre-chamber must not be recessed into the cylinder head.

Cylinder head bolts. As follows:

a. Using the sequence shown in figure 10, tighten all bolts to 25 N-m (20 ft. lbs.).

b. In sequence, tighten all bolts to 65 N-m (50 ft. lbs.).

(install or connect) (Figure 10)

1. Head gasket to the block, over the dowel pins.

Important

• The block gasket surfaces must be clean.

• DO NOT use a sealer on the head gasket. The head gasket is manufactured with the proper amount of sealant “printed” on its surface.

Additional sealer may cause leakage or malfunction. In addition, some sealers may attack the sealant already on the head gasket.

2. Rear cylinder head bolt to the cylinder head (left cylinder head). Apply sealant to the bolt as described in step 4. Due to clearances, the bolt must be installed at this time.

3. Cylinder head. Make sure the gasket surfaces are clean. Guide the head carefully into place over the dowel pins.

• Make sure the bolt threads are clean.

• Apply sealant (GM part number 1052080 or equivalent) to the bolt threads and under the bolt heads.

Tighten

• Cylinder head bolts, as follows:

a. Using the sequence shown in figure 10, tighten all bolts to 25 N-m (20 ft. lbs.).

b. In sequence, tighten all bolts to 65 N-m (50 ft. lbs.).

7. Radiator, bypass, and heater hoses.

8. Pushrods and rocker arm assemblies, in their original locations, as described previously. Hardened ends of the pushrods must face up.

10. Glow plug wires.

11. Generator (right cylinder head).

12. Air conditioning compressor (left side cylinder head).

• Raise the vehicle. Support with suitable safety stands.

13. Exhaust pipe to the manifold.

• Lower the vehicle.

14. Glow plug relay (left cylinder head).

15. Ground wire at the cowl (right cylinder head).

16. Dipstick tube (left cylinder head).

17. Rocker arm covers, as outlined previously.

18. Injection lines. Refer to DIESEL FUEL INJECTION (SEC. 6C2).

19. Intake manifold, as outlined previously.

• Fill the cooling system with the proper quantity and grade of coolant.

Installation (R and V Models) (Both Sides)

1. Head gasket to the block, over the dowel pins.

Important

• The block gasket surfaces must be clean.

• DO NOT use a sealer on the head gasket. The head gasket is manufactured with the proper amount of sealant “printed” on its surface.

Installation (G Models) (Right Side)

1. Head gasket to the block, over the dowel pins.

Important

• The block gasket surfaces must be clean.

• DO NOT use a sealer on the head gasket. The head gasket is manufactured with the proper amount of sealant “printed” on its surface.
Additional sealer may cause leakage or malfunction. In addition, some sealers may attack the sealant already on the head gasket.

2. Cylinder head. Make sure the gasket surfaces are clean. Guide the head carefully into place over the dowel pins.

3. Cylinder head bolts.
   • Make sure the bolt threads are clean.
   • Apply sealant (GM part number 1052080 or equivalent) to the bolt threads and under the bolt heads.

Tighten
• Cylinder head bolts, as follows:
  • Using the sequence shown in figure 10, tighten all bolts to 25 N·m (20 ft. lbs.).
  • In sequence, tighten all bolts to 65 N·m (50 ft. lbs.).
  • In sequence, tighten all bolts an additional 90 degrees (1/4 turn).

   • Bolts to 42 N·m (31 ft. lbs.).

5. Generator upper bracket.

7. Transmission dipstick tube.

8. Air cleaner resonator and bracket.

9. Pushrods and rocker arm assemblies, in their original locations, as described previously. Hardened ends of the pushrods must face up.

10. Rocker arm cover, as outlined previously.

11. Oil fill tube upper bracket.

12. Dipstick tube front bracket.

13. Air conditioning compressor (if equipped). Refer to AIR CONDITIONING (SEC. 1B).
   • Raise the vehicle. Support with suitable safety stands.

15. Rear air conditioning compressor bracket (if equipped).

   • Lower the vehicle.

17. Upper fan shroud and air conditioning compressor belt (vehicles with air conditioning).

18. Transducer (if equipped).

19. Injection lines. Refer to DIESEL FUEL INJECTION (SEC. 6C2).

20. Intake manifold, as outlined previously.
   • Fill the cooling system with the proper quantity and grade of coolant.

INSTALLATION (G MODELS) (LEFT SIDE)

Install or Connect (Figure 10)

1. Head gasket to the block, over the dowel pins.

Important
• The block gasket surfaces must be clean.
• DO NOT use a sealer on the head gasket. The head gasket is manufactured with the proper amount of sealant “printed” on its surface.

2. Cylinder head. Make sure the gasket surfaces are clean. Guide the head carefully into place over the dowel pins.

3. Cylinder head bolts.
   • Make sure the bolt threads are clean.
   • Apply sealant (GM part number 1052080 or equivalent) to the bolt threads and under the bolt heads.

Tighten
• Cylinder head bolts, as follows:
  • Using the sequence shown in figure 10, tighten all bolts to 25 N·m (20 ft. lbs.).
  • In sequence, tighten all bolts to 65 N·m (50 ft. lbs.).
  • In sequence, tighten all bolts an additional 90 degrees (1/4 turn).

Tighten
• Bolts to 42 N·m (31 ft. lbs.).

5. Generator upper bracket.

6. Transmission dipstick tube.

7. Air cleaner resonator and bracket.

8. Pushrods and rocker arm assemblies, in their original locations; as described previously. Hardened ends of the pushrods must face up.

9. Rocker arm cover, as outlined previously.

10. Fuel return line bracket.

11. Vacuum line clip.

15. Dipstick tube front bracket.

16. Power steering pump and brackets.

17. Air conditioning compressor (if equipped). Refer to AIR CONDITIONING (SEC. 1B).
   • Raise the vehicle. Support with suitable safety stands.

18. Injection lines. Refer to DIESEL FUEL INJECTION (SEC. 6C2).

20. Glow plug wires.

22. Left exhaust manifold, as outlined previously.
   • Lower the vehicle.

23. Upper fan shroud and air conditioning compressor belt (vehicles with air conditioning).

24. Transducer (if equipped).

25. Intake manifold, as outlined previously.
   • Fill the cooling system with the proper quantity and grade of coolant.
   • Evacuate and charge the air conditioning system. Refer to AIR CONDITIONING (SEC. 1B).
OIL PUMP DRIVE REPLACEMENT

For gear driven vacuum pump replacement, refer to VACUUM PUMP (SEC. 6H).

NOTICE: Do not run the engine without the gear driven vacuum pump or oil pump drive in place. This will cause extensive engine damage.

Remove or Disconnect (Figure 11)
1. Bolt and clamp.
2. Oil pump drive.

Install or Connect (Figure 11)
1. New gasket to the oil pump drive.
2. Oil pump drive to the engine. Index the drive with the camshaft gear and oil pump drive shaft. Make sure the drive seats fully.
3. Clamp and bolt.

Tighten
- Bolt to 42 N·m (31 ft. lbs.).

TORSIONAL DAMPER AND FRONT CRANKSHAFT SEAL REPLACEMENT

Remove or Disconnect (Figure 12)
Tools Required:
J-23523-E Torsional Damper Puller
1. Battery cables.
2. Upper fan shroud (G models).
3. Accessory drive belts.
- Raise the vehicle (G models). Support with suitable safety stands.
4. Bolts and crankshaft pulley.
5. Torsional damper bolt and washer.
7. Front crankshaft seal. Pry out with a screwdriver.

Tighten
- Bolt to 270 N·m (200 ft. lbs.).
4. Crankshaft pulley and bolts.

Tighten
- Bolts to 40 N·m (30 ft. lbs.).
- Lower the vehicle, if necessary.
5. Accessory drive belts. Tension as outlined in ENGINE COOLING (SEC. 6B).
6. Upper fan shroud (G models).
7. Battery cables.
**FRONT COVER REPLACEMENT**

**Remove or Disconnect (Figures 14 and 15)**
- Drain the cooling system.
  1. Water pump. Refer to ENGINE COOLING (SEC. 6B).
  2. Rotate the engine until the timing marks on the pump gear and camshaft gear are aligned (figure 15).
  3. Scribe a mark aligning the injection pump flange and front cover.
  4. Torsional damper, as outlined previously.
  5. Four front cover to oil pan bolts.
  6. Two fuel return line clips.
  7. Injection pump gear.
  8. Injection pump retaining nuts at the front cover.
  10. Front cover bolts.
  11. Front cover.
  12. Front crankshaft seal. Pry out with a screwdriver.

**Clean**
- RTV from oil pan sealing surface.
- Sealing surfaces on front cover.

**Inspect**
- Front cover for cracks or damage to sealing surfaces.

**Install or Connect (Figures 14 and 15)**

**Tool Required:**
- J-22102 Seal Installer

1. New front crankshaft seal to the front cover. Use J-22102.
2. Front cover to the engine. Install the attaching bolts.
   - Front cover to block bolts to 45 N·m (33 ft. lbs.).
   - Oil pan to front cover bolts to 10.0 N·m (84 in. lbs.).
   - Baffle bolts and nut to 45 N·m (33 ft. lbs.).
   - Align the scribe marks on the front cover and injection pump. If a new front cover was installed, refer to “Marking TDC on the Front Housing” in DIESEL FUEL INJECTION (SEC. 6C2).
4. Injection pump nuts.

---

**Figure 14—Front Cover and Components**

**Figure 15—Injection Pump Gear and Timing Marks**
**Figure 16—Timing Chain and Sprockets**

**Tighten**
- Nuts to 42 N·m (31 ft. lbs.).

**Measure**
- Clearance between injection pump gear and baffle (figure 14). It is necessary to maintain a minimum of 1.0 mm (0.040-inch) between the gear and baffle, or noise may result.

**6. Fuel return line bolts**
7. Torsional damper, as outlined previously.
8. Water pump. Refer to ENGINE COOLING (SEC. 6B).
- Fill the cooling system with the proper quantity and grade of coolant.

**TIMING CHAIN AND SPROCKET REPLACEMENT**

**Remove or Disconnect (Figure 16)**

1. Front cover, as outlined previously.

**Measure**
- Timing chain free play as follows:
  - Mount a dial indicator to the front of the block.
  - Position the dial indicator so that the plunger contacts the timing chain between the two gears.
  - Pull the chain outward (parallel to the front face of the block) the maximum amount with finger pressure on the inside of the chain.
  - Set the dial indicator to zero.

2. Injection pump gear.
3. Camshaft gear.
4. Camshaft sprocket with timing chain.
5. Crankshaft sprocket.

**Install or Connect (Figures 14 and 16)**

1. Crankshaft sprocket.
2. Camshaft sprocket with timing chain.

**Important**
- Align the timing marks (figure 16).
3. Camshaft gear, bolt, and washer.

**Tighten**
- Bolt to 100 N·m (75 ft. lbs.).

4. Injection pump gear and bolts.

**Important**
- Align the timing marks (figure 15).

**Tighten**
- Bolts to 23 N·m (17 ft. lbs.).

5. Front cover, as outlined previously.

**Adjust**
- Injection pump timing, if new gears, sprockets, or timing chain were installed. Refer to DIESEL FUEL INJECTION (SEC. 6C2).

**CAMSHAFT REPLACEMENT**

**R AND V MODELS**

**Remove or Disconnect (Figure 17)**

1. Battery cables.
2. Radiator, shrouds, and fan. Refer to ENGINE COOLING (SEC. 6B).
3. Vacuum pump. Refer to VACUUM PUMP (SEC. 6H).
4. Power steering pump, generator, and air conditioning compressor and position aside.
5. Rocker arm covers, as outlined previously.
6. Rocker arm assemblies and pushrods, as outlined previously.

**Important**
- Rocker arm assemblies and pushrods must be marked for proper assembly, as outlined previously.

7. Hydraulic lifters, as outlined previously. Place the lifters in an organizer rack. The lifters must be installed in the same bore from which they were removed.
8. Front cover, as outlined previously.
9. Timing chain and camshaft sprocket, as outlined previously.
10. Fuel pump (lift pump).
11. Front engine mounting through bolts.

NOTICE: When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

• Raise the engine and block in position.
12. Air conditioning condenser mounting bolts (if equipped). Lift the condenser with the aid of an assistant.
13. Bolts and thrust plate.
14. Camshaft. Pull the camshaft from the block carefully to avoid damage to the camshaft bearings.
15. Spacer (if necessary).

Cleaning, Inspection and Repair
Clean, inspect and repair or replace the camshaft and related components, as outlined in the proper unit repair manual. The unit repair manual also describes camshaft bearing replacement.

Install or Connect (Figures 16, 17, 34 and 35).

• When a new camshaft is installed, replacement of all hydraulic lifters, engine oil, and oil filter is recommended.
1. Spacer, with the ID chamfer towards the camshaft.
2. Camshaft.
   • Coat the camshaft lobes with “Molykote” or equivalent.
   • Lubricate the camshaft bearing journals with engine oil.
   • Insert the camshaft carefully into the block to avoid damage to the camshaft bearings.
3. Thrust plate and bolts.

NOTICE: See “Notice” on page 6A6-1 of this section.

4. Engine mounting through bolts and nuts.

Tighten
• Bolts to 23 N·m (17 ft. lbs.).
• Lower the engine.

5. Timing chain and sprockets, as outlined previously.

Important
• Align the timing marks (figure 16).
6. Air conditioning condenser (if equipped).
7. Fuel pump (lift pump).
8. Front cover, as outlined previously.
9. Hydraulic lifters, as outlined previously. Used lifters must be installed in the same bore from which they were removed.
10. Rocker arm assemblies and pushrods, in their original locations, as outlined previously. Hardened ends of the pushrods must face up.
11. Rocker arm covers, as outlined previously.
12. Power steering pump, generator, and air conditioning compressor, as equipped.
13. Vacuum pump. Refer to VACUUM PUMP (SEC. 6H).
14. Fan, radiator, and radiator shrouds. Refer to ENGINE COOLING (SEC. 6B).
15. Battery cables.
   • Fill the cooling system with the proper quantity and grade of coolant.

14. Front cover, as outlined previously.
15. Fuel pump (lift pump).
16. Rocker arm covers, as outlined previously.
17. Rocker arm assemblies and pushrods, as outlined previously.
Important

- Rocker arm assemblies and pushrods must be marked for proper assembly, as outlined previously.

18. Hydraulic lifters, as outlined previously. Place the lifters in an organizer rack. The lifters must be installed in the same bore from which they were removed.

19. Timing chain and camshaft sprocket, as outlined previously.

20. Bolts and thrust plate.

21. Camshaft. Pull the camshaft from the block carefully to avoid damage to the camshaft bearings.

22. Spacer, if necessary.

Cleaning, Inspection and Repair

Clean, inspect and repair or replace the camshaft and related components, as outlined in the proper unit repair manual.

The unit repair manual also describes camshaft bearing replacement.

Install or Connect (Figures 16 and 17).

- When a new camshaft is installed, replacement of all hydraulic lifters, engine oil, and oil filter is recommended.

1. Spacer, with the ID chamfer towards the camshaft.

2. Camshaft.
   - Coat the camshaft lobes with "Molykote" or equivalent.
   - Lubricate the camshaft bearing journals with engine oil.
   - Insert the camshaft carefully into the block to avoid damage to the camshaft bearings.

3. Left front engine mounting through-bolt.

OIL PAN REPLACEMENT (R AND V MODELS)

Install or Connect (Figures 20, 34, and 35)

• Apply a 5 mm (3/16-inch) bead of RTV sealant (GM part number 1052915 or equivalent) to the oil pan sealing surface, inboard of the bolt holes (figure 20). The sealer must be wet to the touch when the oil pan is installed.
1. Oil pan rear seal.
2. Oil pan to the engine. Be sure to connect the oil dipstick.
3. Oil pan bolts.

Tighten

— All except rear two bolts to 10.0 N·m (84 in. lbs.).
— Rear two bolts to 23 N·m (17 ft. lbs.).
• Lower the engine.

**NOTICE:** See "Notice" on page 6A6-1 of this section.

4. Engine mounting through-bolt and nut.

9. Oil pan and oil pump.
- Lower the oil pan from the engine.
- Rotate the crankshaft so that the forward crankshaft throw and numbers 1 and 2 connecting rod journals are up.
- Oil pump to main bearing cap bolt.

• Let the oil pump and extension shaft fall into the oil pan.

- Remove the oil pan and oil pan rear seal.

**Clean**
1. Old RTV from the oil pan and block.
2. All oil and grease from the gasket surfaces.

**Inspect**
- Oil pump pick up tube and screen for damage.
- Oil pump extension shaft bushing for cracks.

**Oil Pump Repair**
- Refer to the proper unit repair manual.

**Install or Connect (Figure 20)**
- Apply a 5 mm (9/32-inch) bead of RTV sealant (GM part number 1052915 or equivalent) to the oil pan sealing surface, inboard of the bolt holes (figure 18). The sealer must be wet to the touch when the oil pan is installed.
1. Oil pan rear seal to the oil pan.
2. Oil pan and oil pump to the engine.
- Lay the oil pump and extension shaft in the oil pan.
- Remove the oil pan rear seal.
- Let the oil pump and extension shaft fall into the oil pan.
- Remove the oil pan and oil pan rear seal.

**REAR CRANKSHAFT OIL SEAL REPLACEMENT**

The production rear crankshaft oil seal is a "rope" type seal. The rope seal can be replaced with a two piece type seal, if desired. Repair procedures for both types of seal follow.

The CDR and crankcase ventilation system should be thoroughly inspected and crankcase pressure should be checked before a new seal is installed. Refer to DRIVEABILITY AND EMISSIONS—DIESEL (SEC. 6E9).
6.2 L DIESEL 6A6-19

Figure 21—Packing the Upper Rear Crankshaft Rope Seal

ROPE TYPE SEAL

Remove or Disconnect

1. Oil pan and oil pump, as outlined previously.
2. Rear main bearing cap.
3. Old rope seal from the main bearing cap. Do not discard.

Clean

— Main bearing cap and block mating surfaces.
— Rope seal groove in the main bearing cap.

Install or Connect (Figures 21 through 24)

Tools Required:
J-33154 Rear Oil Seal Packer
J-33153 Rear Oil Seal Installer

1. Rope seal pieces to the upper seal groove.
   • Use J-33154-2 and gently drive the upper seal into the groove about 6 mm (¼-inch). Do this on both sides. Refer to figure 21.
   • Measure the amount the seal was driven up on one side. Add 1.5 mm (⅛-inch). Cut this length from the old seal removed from the main bearing cap. Use the main bearing cap as a holding fixture when cutting the seal (figure 22). Use a sharp tool. Repeat this procedure for the other side.
   • Install J-33154-1 onto the cylinder block (figure 23).

Apply adhesive (GM part number 1052621 [Loctite 414] or equivalent) to the seal groove. Position the rope seal on the bearing cap. Use J-33153 to install the seal (figure 24). After correctly positioning the seal, rotate J-33153 slightly and cut the seal ends flush with the bearing cap surface. Use a sharp tool (figure 24).

Measure

Rear main bearing clearance, using plastic gaging material. Refer to the proper unit repair manual. If the clearance is out of specification,
3. Check the ends of the seal for fraying that may prevent the main bearing cap from seating. Correct as necessary. Remove the gaging material from the bearing and journal.

**NOTICE:** The main bearing caps are to be tapped into place with a brass or leather mallet before the attaching bolts are installed. Do not use the attaching bolts to pull the main bearing caps into their seats, as this may damage the bearing cap and/or block.

4. Oil pump and oil pan, as outlined previously.

**TWO PIECE TYPE SEAL**

**Remove or Disconnect**

1. Oil pan and oil pump, as outlined previously.
2. Rear main bearing cap.
3. Upper and lower rope seal.

**Clean**

- Upper and lower seal grooves and bearing cap slot with a chlorinated solvent, such as carburetor spray cleaner.
- Main bearing cap and block mating surfaces.

**Measure**

- Rear main bearing clearance, using plastic gage material. Refer to the proper unit repair manual. If the clearance is outside specifications, correct as necessary.

**Install or Connect (Figures 25 and 26)**

1. Seal halves to the block (figure 26).
   - Apply a light coat of engine oil to the seal lips where they contact the crankshaft.
   - "Roll" one seal half into the block seal groove until 13 mm (1/2-inch) of the seal's one end is extending out of the block.
   - Insert the other seal half into the opposite side of the seal groove in the block.

**Important**

- The contact ends of the seal halves should now be at the four and ten o'clock positions, or at the eight and two o'clock positions. This is necessary to align the rear main bearing cap and seal lips.

**NOTICE:** To prevent damage to the main bearing caps, the caps are to be tapped into the block using a brass or leather hammer. The new seal is used as a guide. The cap must NOT be pulled into the block with the bolts.

2. Main bearing cap to the block.
   - Lightly coat the seal groove in the main bearing cap with adhesive (GM part number 1052621 [Loctite 414] or equivalent).
   - Apply a thin film of anaerobic sealant (GM part number 1052756 or equivalent) to the main bearing cap as shown in figure 25. Do not put sealant in the oil relief slot.
   - Tap the main bearing cap into place with a brass or leather mallet. Then install the bolts.
Installing the Upper Seal Half

INSERT IMAGE

6.2 L DIESEL 6A6-21

Figure 26—Installing the Two Piece Rear Crankshaft Seal

- Main bearing cap bolts to specifications, in the following sequence:
  - Inner bolts: 150 N·m (110 ft·lbs.).
  - Outer bolts: 135 N·m (100 ft·lbs.).
  - Re-tighten all bolts using the same sequence.

3. Oil pump and oil pan, as outlined previously.

Connecting Rod and Piston Replacement

- Remove or Disconnect (Figure 27)
  1. Cylinder head, as outlined previously.
  2. Oil pan, as outlined previously.
  3. Oil pump, as outlined previously.
  4. Ridge or deposits from the upper end of the cylinder bores.
     - Turn the crankshaft until the piston is at BDC.

CONNECTING ROD AND PISTON REPLACEMENT

- Insert image

Figure 27—Replacing the Connecting Rod and Piston

- Place a cloth on top of the piston.
- Perform the cutting operation with a ridge reamer.
- Turn the crankshaft until the piston is at TDC.
- Remove the cloth and cuttings.

5. Connecting rod cap. Check the connecting rod and cap for identification marks. Mark the parts if required. The connecting rod and cap must be kept together as mating parts.

6. Connecting rod and piston.
   - Attach two short pieces of 10 mm (3/8-inch) hose to the connecting rod bolts (figure 27). This will protect the crankshaft journal during removal.
   - Push the connecting rod and piston out of the bore.

7. Connecting rod bearings. Place the bearings in a rack if they are to be reused, so they can be returned to their original locations.

Cleaning, Inspection and Repair

Clean, inspect and repair or replace the components as necessary. Measure connecting rod bearing clearance, piston clearance, ring clearances, etc. Refer to the proper unit repair manual.

The unit repair manual contains information on:
- Connecting rod and piston.
- Piston rings.
- Connecting rod and crankpin.
- Cylinder bores.

- Install or Connect (Figures 27 through 30)

Tool Required:
- J-8037 Ring Compressor

- Make sure the cylinder walls are clean. Lubricate the cylinder wall lightly with engine oil.
- Make sure the piston is installed in the matching cylinder. Install new pistons in the cylinders for which they were fitted. Install used pistons in the cylinder from which they were removed.

1. Connecting rod bearings.
Figure 28—Ring Gap Location

- Be certain that the bearings are the proper size.
- Install the bearings in the connecting rod and connecting rod cap.
- Lubricate the bearings with engine oil.

2. Piston and connecting rod to the proper bore.

- With the connecting rod cap removed, install two short pieces of 10 mm (3/8-inch) hose onto the connecting rod studs.
- Locate the piston ring end gaps as shown in figure 28. Lubricate the piston and rings with engine oil.
- Without disturbing the ring end gap location, install J-8037 over the piston (figure 29).
- The piston must be installed so that the depression in the piston crown is towards the outside of the engine. The connecting rod bearing tang slots must be opposite the camshaft.
- Place the piston in its matching bore. Using light blows with a hammer handle, tap the piston down into its bore (figure 29). At the same time, from beneath the vehicle guide the connecting rod to the crankpin with the pieces of hose (figure 27). Hold the ring compressor against the block until all rings have entered the cylinder bore.
- Remove the hoses from the connecting rod bolts.

Figure 29—Installing the Piston and Connecting Rod

Measure
- Connecting rod bearing clearance. Refer to the proper unit repair manual.

3. Connecting rod cap and bearing.
4. Connecting rod cap nuts.

Tighten
- Connecting rod cap nuts to 65 N·m (48 ft. lbs.).

Measure
- Connecting rod side clearance. Use a feeler gage between the connecting rod and crankshaft (figure 30). The correct clearance is 0.17–0.63 mm.

5. Oil pump (if removed), as outlined previously.
6. Oil pan and cylinder head, as outlined previously.

MAIN BEARING REPLACEMENT

Remove or Disconnect (Figure 31)

Tool Required:

J-8080 Main Bearing Remover/Installer

1. Glow plugs.
2. Oil pan, as outlined previously.
3. Oil pump, as outlined previously.
4. Main bearing caps.
• Check the main bearing caps for location markings. Mark the caps if necessary. The caps must be returned to their original locations during assembly.

5. Lower main bearing inserts from the main bearing caps.

6. Rear crankshaft oil seal, if necessary, as outlined previously.

7. Upper main bearing inserts.
   • Insert J-8080 into the crankshaft oil hole (figure 31).
   • Rotate the crankshaft to "turn" the bearing insert out of the block.

Cleaning, Inspection and Repair

Clean, inspect and repair or replace the components as required. Refer to the proper unit repair manual. The unit repair manual contains information on

• Crankshaft.
• Main and connecting rod bearings.

Install or Connect (Figures 26, 31 and 32)

Tool Required:
J-8080 Main Bearing Remover/Installer

1. Upper main bearing inserts.
   • Insert tool J-8080 into a crankshaft main bearing oil hole (figure 31).
   • Apply engine oil to inserts of the proper size.
   • Insert the plain end (without the bearing tang) of the insert between the crankshaft and the notched side of the block.
   • Rotate the crankshaft to "roll" the insert into the block.
   • Remove the tool.

2. Lower main bearing inserts to the main bearing caps.
   • Make sure the inserts are of the proper size.
   • Apply engine oil to the inserts.

Measure

• Main bearing clearance. Refer to the proper unit repair manual. If the engine is in the vehicle, the crankshaft must be supported upward to remove any clearance from the upper bearing. The total clearance can then be measured between the lower bearing and journal.

3. Rear crankshaft oil seal (if necessary) as outlined previously.
NOTICE: The main bearing caps are to be tapped into place with a brass or leather mallet before the attaching bolts are installed. Do not use the attaching bolts to pull the main bearing caps into their seats, as this may damage the bearing cap and/or block.

4. Number 5 (rear) main bearing cap.
   - Apply a thin film of anaerobic sealant (GM part number 1052756 or equivalent) to the bearing cap as shown in figure 25. Keep the sealant off the seal and bearing. Do not put sealant in the bearing cap oil relief slot.
   - Apply a light coat of engine oil to the crankshaft surface that will contact the seal.
   - Apply engine oil to the main bearing cap bolt threads.
   - Tap the main bearing cap into place with a brass or leather mallet. Then install the bolts.

   **Tighten**
   - Bolts to specifications, in the following sequence:
     - Inner bolts: 150 N·m (110 ft. lbs.).
     - Outer bolts: 135 N·m (100 ft. lbs.).
     - Re-tighten all bolts in the same sequence.

5. Numbers 1, 2, and 4 main bearing caps and bolts.

   **Tighten**
   - Bolts to specifications. Refer to step 4.

6. Number 3 (center) main bearing cap and bolts. Tighten the bolts temporarily to 14 N·m (10 ft. lbs.).

   **Measure**
   - Crankshaft end play, as follows:
     - Tap the end of the crankshaft first rearward then forward with a lead hammer. This will line up the rear main bearing and crankshaft thrust surfaces.
     - Tighten the rear main bearing cap bolts to specifications. Refer to step 4.
     - With the crankshaft forced forward, measure at the front end of the number 3 main bearing with a feeler gage (figure 32). The proper clearance is 0.10–0.25 mm.

7. Oil pump, as outlined previously.
8. Oil pan, as outlined previously.

**CRANKSHAFT REPLACEMENT**

1. Remove the engine, as outlined later.
2. Refer to the proper unit repair manual for crankshaft replacement procedures.

**OIL FILTER BYPASS VALVE REPLACEMENT**

**Remove or Disconnect (Figure 33)**
1. Oil filter.
2. Oil filter bypass valve. Pry out with a screwdriver.

**Clean**
- Recess in the block.

**Install or Connect (Figure 33)**
1. Oil filter bypass valve. Tap into place, using a 16 mm socket.
2. Oil filter.
3. Engine oil, as required.
**ENGINE MOUNTINGS**

**NOTICE:** Broken or deteriorated mountings can cause misaligned and eventual destruction of certain drive train components. When a single mounting breakage occurs, the remaining mountings are subjected to abnormally high stresses.

**INSPECTING ENGINE MOUNTINGS**

**Front Engine Mountings**

**NOTICE:** When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

1. Raise the engine to remove weight from the mountings and to place a slight tension on the rubber cushion. Observe both mountings while raising the engine.
2. Replace the mounting if the following conditions exist:
   - Hard rubber surface covered with heat check cracks.
   - Rubber cushion separated from the metal plate of the mounting.
   - Rubber cushion split through the center.
3. If there is movement between a metal plate of the mounting and its attaching points, lower the engine and tighten the bolts or nuts attaching the mounting to the engine, frame, or bracket.

**Rear Mountings**

1. Push up and pull down on the transmission tailshaft. Observe the transmission mounting.
2. Replace the mounting if the following conditions exist:
   - Rubber cushion separated from the metal plate of the mounting.
   - Mounting bottomed out (tailshaft can be moved up but not down).
3. If there is relative movement between a metal plate of the mounting and its attaching point, tighten the bolts or nuts attaching the mounting to the engine, frame, or crossmember.

**FRONT MOUNTING REPLACEMENT**

**Remove or Disconnect (Figures 34 through 37)**

**NOTICE:** When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, jacking against the oil pan may cause it to be bent against the pump screen, resulting in a damaged oil pickup unit.

1. Engine mounting through-bolt and nut.
2. Mounting assembly bolts, nuts, and washers.

**Install or Connect (Figures 34 through 37)**

1. Engine mounting assembly to the vehicle.
   - On V, G, and P models, the through-bolt must be inserted from the rear of the right side mounting before the mounting is installed in the vehicle.

**NOTICE:** See “Notice” on page 6A6-1 of this section.

2. Mounting assembly bolts, nuts, and washers.

   **Tighten**
   - Fasteners to specifications. Refer to figures 34 through 37.
   - On V, G, and P models (right side), make sure there is 25 mm (1 inch) clearance between the through bolt head and mounting assembly.
   - Lower the engine until the through bolts can be inserted.

**NOTICE:** See “Notice” on page 6A6-1 of this section.

3. Through bolts and nuts.

   **Tighten**
   - Fasteners to specifications. Refer to figures 34 through 37.

**REAR MOUNTING REPLACEMENT (EXCEPT P MODEL FLYWHEEL HOUSING MOUNTING)**

**Remove or Disconnect (Figures 38 through 41)**

**NOTICE:** When raising or supporting the engine for any reason, do not use a jack under the oil pan, any sheet metal or crankshaft pulley. Due to the small clearance between the oil pan and the oil pump screen, resulting in a damaged oil pickup unit.

1. Mounting to crossmember nut(s) and washer(s).
2. Mounting to transmission bolts and washers.
3. Raise the rear of the engine only enough to permit removal of the mounting.

**NOTICE:** See “Notice” on page 6A6-1 of this section.

1. Mounting to crossmember nut(s) and washer(s).
2. Mounting to transmission bolts and washers.

**Install or Connect (Figures 38 through 41)**

1. Mounting.
2. Lower the rear of the engine.
3. Mounting to transmission bolts and washers.

**NOTICE:** See “Notice” on page 6A6-1 of this section.

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of this manual as indicated at appropriate locations by the terminology "See NOTICE on page 6A7-1 of this section."

**NOTICE:** All engine fasteners are important attaching parts in that they could affect the performance of vital components and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Torque values must be used as specified during reassembly to assure proper retention of all parts.

DESCRIPTION

The connecting rods are forged steel, with precision insert type crankpin bearings. The piston pins are a press fit in the connecting rods.

The pistons are cast aluminum alloy. The piston pins are a floating fit in the pistons.

ENGINE LUBRICATION

Lubrication schematics are shown in figures 1 and 2. The gear type oil pump is driven through an extension shaft from the distributor drive shaft, which is gear driven from the camshaft. Oil is drawn into the oil pump through a pickup screen and pipe.

Pressurized oil is routed to the oil filter. In case of excessive backpressure at the oil filter, a bypass valve is provided. This valve will allow oil flow to the main oil gallery at the right side of the block. This gallery supplies oil to the camshaft bearings, hydraulic lifters, and main bearings. The connecting rods are supplied oil from the main bearings by means of drilled passages in the crankshaft. The valve train is supplied with oil by the hydraulic lifters. Oil is pumped from the lifters through the hollow pushrods to the rocker arms. Oil drains back to the crankcase through oil drain holes and the pushrod holes. The piston, piston pin, and timing gears are lubricated by oil splash.

Figure 1—Lubrication Diagram (Side View)

4.8L engines are inline six cylinder type, overhead valve, water cooled, with cast iron block and head.

The crankshaft is supported by seven precision insert main bearings, with crankshaft thrust taken at the number seven (rear) bearing.

The camshaft is supported by four plain type bearings and is gear driven. Motion from the camshaft is transmitted to the valves by hydraulic lifters, pushrods, and ball-type rocker arms. The valve guides are integral in the cylinder head.

ON-VEHICLE SERVICE:

   - Tighten
   - Bolts to 4.3 N·m (38 in. lbs.).
4. Wiring, fuel and vacuum lines to the clips.
5. Air cleaner.
6. Crankcase ventilation hoses to the rocker arm cover.

ROCKER ARM AND PUSHROD REPLACEMENT

**Remove or Disconnect**
1. Rocker arm cover, as outlined previously.
2. Rocker arm nut.
   - If only the pushrod is to be replaced, back the rocker arm nut off until the rocker arm can be swung away from the pushrod. Then pull the pushrod out.
3. Rocker arm with ball.
4. Pushrod.

**Important**
- Store used components in order so they can be reassembled in the same location.

**Inspect**
- Rocker arms and balls at their mating surfaces. These surfaces should be smooth and free from scoring or other damage.
- Rocker arm areas which contact the valve stems and the sockets which contact the pushrods. These areas should be smooth and free of damage and wear.
- Pushrods for bending. Roll the pushrod on a flat surface to determine if it is bent. Replace if necessary.
- Ends of the pushrods for scoring or roughness.

**Install or Connect**
1. Pushrod. Make sure the pushrod seats properly in the hydraulic lifter.
2. Rocker arm with ball.
   - Important
   - When new rocker arms and/or balls are installed, coat their bearing surfaces with "Molykote" or equivalent.
3. Rocker arm nut.
   - Adjust
   - Valves as outlined later.
4. Rocker arm cover, as outlined previously.
VALVE ADJUSTMENT

1. Remove the rocker arm cover as outlined previously.
2. Adjust the valves when the lifter is on the base circle of the camshaft lobe as follows:
   a. Mark the distributor housing with chalk, at #1 and #6 plug wire positions. Remove the distributor cap and lay aside.
   b. Crank the engine until the distributor rotor points to #1 cylinder position. The following valves can be adjusted with the engine in the #1 firing position:
      #1 cylinder—Exhaust and Intake
      #2 cylinder—Intake
      #3 cylinder—Exhaust
      #4 cylinder—Intake
      #5 cylinder—Exhaust
   c. Back out the adjusting nut until lash is felt at the pushrod, then turn in the adjusting nut until all lash is removed. This can be determined by rotating the pushrod while turning the adjusting nut (figure 4). When play has been removed, turn the adjusting nut in one full additional turn (to center the lifter plunger).
   d. Crank the engine until the distributor rotor points to #6 position. The following valves can be adjusted with the engine in #6 firing position:
      #2 cylinder—Exhaust
      #3 cylinder—Intake
      #4 cylinder—Exhaust
      #5 cylinder—Intake
      #6 cylinder—Intake and Exhaust
3. Install the distributor cap.
4. Install the rocker arm cover as outlined previously.

VALVE STEM SEAL AND VALVE SPRING REPLACEMENT

Remove or Disconnect (Figures 5 and 6)
Tools Required:
- J-23590 Air Adapter.
- J-5892-B Spring Compressor.
- Rocker arm cover, as outlined previously.
- Rocker arms, as outlined previously.
- Spark plugs.
- Valve keepers (20).
1. Rocker arm cover, as outlined previously.
2. Rocker arms, as outlined previously.
4. Valve keepers (20).
   - Install J-23590 into the spark plug hole.
   - Apply compressed air to hold the valves in place.
   - Install a rocker arm nut (figure 6).
   - Use J-5892-B to compress the valve spring (figure 6).
   - Remove the valve keepers.
   - Carefully release the spring tension. Remove J-5892-B.
Figure 7—Testing The Valve Seals

5. Rotator (21), shield (22) and spring (26) with damper (25).
6. O-ring seal (23).
7. Seal (24) (intake valve only).

Install or Connect (Figures 5, 6, and 7)

Tools Required:
- J-23590 Air Adapter
- J-5892-B Spring Compressor
- J-23738-A Vacuum Pump

1. New seal (24) (intake valve only). Install the seal over the valve stem and seat it against the head.
2. Spring (26) with the damper (25), shield (22) and rotator (21).
3. New O-ring seal (23) and valve keepers (20).
   - With air pressure applied to the cylinder with J-23590, compress the spring with J-5892-B (figure 6).
   - Lubricate the o-ring seal with engine oil. Install the seal on the valve stem. Make sure the seal is not twisted.
   - Install the valve keepers. Use grease to hold them in place.
   - Carefully release spring pressure. Make sure the valve keepers stay in place.
   - Remove J-5892-B and J-23590.
   - Check each o-ring seal for leakage (figure 7).
     - Place the suction cup furnished with J-23738-A over the shield.
     - Connect J-23738-A to the suction cup and apply a vacuum. Watch the vacuum pump gage. No air should be able to leak past the seal. If the seal will not hold a vacuum, it may have been damaged or improperly installed.
4. Spark plugs.
5. Rocker arms, as outlined previously.

Adjust
- Valves, as outlined previously.
6. Rocker arm cover, as outlined previously.

Figure 8—Removing The Hydraulic Lifter

PUSHROD COVER REPLACEMENT

Remove or Disconnect
1. Battery negative cable.
2. Dipstick tube.
3. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
4. Pushrod cover bolts.
5. Pushrod cover.

Clean
- Old gasket from pushrod cover and block.

Install or Connect
1. Pushrod cover and new gasket.
2. Pushrod cover bolts.

Adjust
- Pushrod cover bolts to 9.0 N·m (80 in. lbs.).
3. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
4. Dipstick tube (if removed).
5. Battery negative cable.

HYDRAULIC LIFTER REPLACEMENT

Remove or Disconnect (Figures 8 and 9)

Tools Required:
- J-3049 Hydraulic Lifter Remover (Plier Type) or J-9290-01 Hydraulic Lifter Remover (Slide Hammer Type)

1. Rocker arm cover, pushrod cover, and pushrod, as outlined previously.
2. Hydraulic lifters.
4.8 LITER L6 6A7-7

Figure 9—Removing The Hydraulic Lifter

- Remove the hydraulic lifters one at a time and place them in an organizer rack. The lifters must be installed in the same bore from which they were removed.
- A stuck hydraulic lifter can be removed using J-3049 (figure 8 or J-9290-01 (figure 9).

Inspect

- Hydraulic lifter body for scuffing and scoring. If the lifter body wall is worn or damaged, the mating bore in the block should also be checked.
- Check the fit of each hydraulic lifter in its mating bore in the block. If the clearance is excessive, try a new lifter.
- The hydraulic lifter foot must be smooth and slightly convex. If worn, pitted, or damaged, the mating camshaft lobe should also be checked.

Hydraulic Lifter Repair

- Refer to the proper unit repair manual.

Install or Connect

1. Hydraulic lifters to the block. Lubricate the lifter foot and body with Engine Oil Supplement or equivalent.
   - When any new hydraulic lifters or a new camshaft is installed, also replace the crankcase oil and filter. Engine Oil Supplement (or equivalent) should be added to the crankcase oil.
   - Replace all hydraulic lifters when a new camshaft is installed.

INTAKE AND EXHAUST MANIFOLD REPLACEMENT

Remove or Disconnect (Figures 10 and 11)

1. Battery negative cable.
2. Air cleaner.
3. Throttle controls at the bell crank.
4. Carburetor (if necessary).
5. Fuel and vacuum lines from the manifold, EGR valve (if used) and EFE valve.
6. AIR pump and bracket.
7. PCV hose.
8. Exhaust pipe.
10. Clamps (32), bolts (31), nuts (33) and washers.
11. Manifold assembly and gasket.

Disassemble (Figure 11)

1. Bolt (35) and nuts (40).
2. Manifolds (34 and 39).
3. Gasket (38).

Clean

- All manifold bolts and studs. Then apply engine oil to the threads.
- All traces of old gaskets from the cylinder head and manifolds.

Inspect

- Manifolds for cracks or damage to gasket surfaces.
- Operation of EFE or manifold heat valve (if used).
- Gaskets, if necessary to diagnose a leakage problem.
Figure 11—Manifolds And Components

Measure
- Manifold distortion. Lay a straight edge along the full length of the manifold exhaust port faces and measure any gaps between the straight edge and the port faces. If at any point a gap of 0.080 mm (0.030-inch) or more exists, it is likely that the manifold has distorted to a point where it will not seal properly. If a good exhaust seal is to be expected, the exhaust manifold must be replaced.

Assemble (Figure 11)
1. Gasket (38) to the exhaust manifold (34).
2. Intake manifold (39) to the exhaust manifold.
3. Both (35), washers (36) and nuts (40). LEAVE FINGER TIGHT.

Install or Connect (Figures 10 and 11)
1. New gasket, over the manifold studs on the cylinder head.
2. Manifold assembly.
3. Clamps (32).
4. Bolts (31), and nuts (33).

Important
- Always tighten the manifold to cylinder head bolts and nuts (31 and 33) BEFORE tightening the manifold center bolt and nuts (35 and 40).

Figure 12—Removing The Rocker Arm Stud

Tighten
- Bolts (31) and nuts (33) to 52 N-m (38 ft. lbs.).
- Bolts (35) and nuts (40) to 60 N-m (44 ft. lbs.).
5. Manifold heat stove.
7. PCV hose.
8. Air pump and bracket.
9. Fuel and vacuum lines from the manifold, EGR valve (if used) and EFE valve (if used).
10. Carburetor (if removed).
11. Throttle controls.
12. Air cleaner.
13. Battery negative cable.

Adjust
- Engine idle speed, if necessary.

ROCKER ARM STUD REPLACEMENT

Remove or Disconnect (Figure 12)
Tool Required:
J-5802-01 Rocker Arm Stud Remover
1. Rocker arm cover and rocker arm, as outlined previously.
2. Rocker arm stud.
- Place J-5802-01 over the rocker arm stud.
- Install a nut and flat washer.
- Turn the nut to remove the stud (figure 12).

Install or Connect (Figures 13 and 14)
Tools Required:
J-5715 Reamer (0.003-inch oversize) or J-6036 Reamer (0.013-inch oversize)
J-6880 Rocker Arm Stud Installer

NOTICE: Do not attempt to install an oversize rocker arm stud without reaming stud hole as this could damage the cylinder head.
Ream the hole to the proper size for the replacement oversize rocker arm stud. Use J-5715 for 0.003-inch oversize studs; J-6036 for 0.013-inch oversize stud (figure 13).

Coat lower end (press-fit area) of the rocker arm stud with hypoid axle lubricant.

1. Rocker arm stud. Use J-6880 (figure 14). Stud is installed to proper depth when the tool bottoms on the cylinder head.

2. Rocker arm, as outlined previously.

Figure 13—Reaming The Rocker Arm Stud Bore

- Ream the hole to the proper size for the replacement oversize rocker arm stud. Use J-5715 for 0.003-inch oversize studs; J-6036 for 0.013-inch oversize stud (figure 13).
- Coat lower end (press-fit area) of the rocker arm stud with hypoid axle lubricant.

1. Rocker arm stud. Use J-6880 (figure 14). Stud is installed to proper depth when the tool bottoms on the cylinder head.

2. Rocker arm, as outlined previously.

Figure 15—Cylinder Head Bolt Tightening Sequence

Adjust

- Valves, as outlined previously.

3. Rocker arm cover, as outlined previously.

CYLINDER HEAD REPLACEMENT

Remove or Disconnect

1. Battery ground cable.
2. Manifold assembly, as outlined previously.
3. AIR check valve.
4. Rocker arm cover, as outlined previously.
5. Pushrods. Back off the rocker arm nuts. Turn the rocker arms aside, then remove the pushrods. Place the pushrods in a rack so they can be returned to their original locations at assembly.
6. Spark plug wires at the spark plugs.
7. Vacuum lines at the thermal vacuum switch on the water outlet.
8. Drain the radiator and block.
10. Battery ground strap at the cylinder head.
11. Cylinder head bolts.

Clean

- Carbon deposits from combustion chambers.
- All traces of old head gasket from cylinder head and block.
- Cylinder head bolt threads and threads in the block.

Inspect

- Sealing surfaces of the block and cylinder head for nicks, heavy scratches, or other damage.

Cylinder Head Repair

- Refer to the proper Unit Repair Manual.

Install or Connect (Figure 15)

1. Head gasket.
   - If a steel gasket is used, coat both sides of the gasket with sealer. Spread the sealer thin and even.
Figure 16—Removing The Torsional Damper

- Do not use sealer on composition steel-asbestos gaskets.
- Place the gasket over the block dowel pins with the bead up.

2. Cylinder head. Carefully guide the cylinder head into place over the dowel pins and gasket.

3. Tighten

- Cylinder head bolts, a little at a time, using the sequence shown in figure 15, until the specified torque is reached.
  - Left hand front bolt: 115 N·m (85 ft. lbs.).
  - All other bolts: 130 N·m (95 ft. lbs.).

4. Battery ground strap at the cylinder head.

5. Upper radiator hose, heater hose, and water pump bypass hose. Fill the cooling system with the proper coolant.

6. Vacuum lines at the thermal vacuum switch.

7. Spark plug wires.

8. Pushrods. Be sure to install them in their original locations.

9. Rocker arms to the pushrods.

9. Adjust

- Valves, as outlined previously.

10. Rocker arm cover, as outlined previously.

11. AIR check valve.

12. Manifold assembly, as outlined previously.

13. Battery ground cable.

TORSIONAL DAMPER AND FRONT CRANKSHAFT SEAL REPLACEMENT

Remove or Disconnect (Figure 16)

Tool Required:
- J-23523-E Torsional Damper Puller and Installer.

Install or Connect (Figures 17 and 18)

Tools Required:
- J-23523-E Torsional Damper Puller and Installer
- J-35468 Centering Tool and Seal Installer

1. Battery negative cable.

2. Radiator. Refer to ENGINE COOLING (SEC. 6B).

3. Drive belts from the crankshaft pulley.

4. Torsional damper bolt and washer.

6. Front crankshaft seal. Pry out with a large screwdriver. Take care not to distort the timing gear cover.

Inspect

- Oil seal contact area on the torsional damper for grooving and roughness. Replace if necessary.

Install or Connect (Figures 17 and 18)

Tools Required:
- J-23523-E Torsional Damper Puller and Installer
- J-35468 Centering Tool and Seal Installer

1. Front crankshaft seal. Use J-35468 (figure 17). Coat the seal lips with engine oil. The open end of the seal faces inside the engine.
NOTICE: The inertia weight section of the torsional damper is assembled to the hub with a rubber type material. The correct installation procedures (with the proper tool) must be followed or movement of the inertia weight section of the hub will destroy the turning of the torsional damper.

2. Crankshaft key (if removed).
3. Stud (item C, figure 18) to the crankshaft. Thread the stud fully into the tapped end of the crankshaft.
4. Torsional damper over the end of the stud. Align the keyway in the torsional damper shaft with the crankshaft key.
5. Bearing, washer, and nut (figure 18).
   - Turn the nut to pull the torsional damper into place.
   - Remove the tool.
6. Torsional damper bolt and washer.

Tighten
- Torsional damper bolt to 70 N·m (50 ft. lbs.).
7. Drive belts to the crankshaft pulley, and tension to specifications.
8. Radiator. Refer to ENGINE COOLING (SEC. 6B).
9. Battery negative cable.
   - Fill the cooling system with the proper coolant.

TIMING GEAR COVER REPLACEMENT

Remove or Disconnect
1. Battery negative cable.
2. Torsional damper, as described previously.
3. Oil pan to timing gear cover bolts.
4. Timing gear cover to block bolts.
5. Timing gear cover.
   - Pull the cover slightly forward only enough to permit cutting of the oil pan front seal.
   - Using a sharp knife or other suitable cutting tool, cut the oil pan front seal flush with the block at both sides of the oil pan.
   - Remove the cover and attached portion of the oil pan front seal.
6. Timing gear cover gasket.
7. Front crankshaft seal. Pry out with a screwdriver. Be careful not to distort the timing gear cover.

Clean
- Old gasket from the timing gear cover, block, and oil pan.

Install or Connect (Figures 17, 19, and 20)
Tool Required:
  J-35468 Centering Tool and Seal Installer
1. Front crankshaft to the timing gear cover.
   - Lubricate the seal lips with engine oil.
   - Use J-35468 to press the seal into place (figure 19).
   - Leave the tool in position in the seal.
2. Timing gear cover to oil pan seal.

Important
- The tool is used to align the timing gear cover so that the front crankshaft seal is properly centered around the crankshaft. The seal must be centered to prevent damage during hub installation.
3. Timing gear cover to block gasket to the timing gear cover. Use gasket sealer to hold it in place.
   - Apply a 3 mm (1/8-inch) bead of RTV sealant to the joint formed at the oil pan and cylinder block.
4. Timing gear cover, with J-35468 in place, to the block (figure 17).
5. Oil pan to timing gear cover bolts. Partially tighten the bolts.
6. Timing gear cover to block bolts.

Tighten
- Timing gear cover to block bolts to 9.0 N·m (80 in. lbs.).
- Oil pan to timing gear cover bolts to 5.1 N·m (45 in. lbs.).

Remove or Disconnect
- J-35468 from the timing gear cover.
7. Torsional damper, as outlined previously.
8. Battery negative cable.

**OIL PAN REPLACEMENT**

**Remove or Disconnect**
1. Battery negative cable.
   • Drain the engine oil.
2. Starter.
3. Torque converter or flywheel cover.
4. Front engine mount through-bolts.
   • Raise the engine and block in position.
5. Oil pan bolts.
6. Oil pan.
7. Old gaskets and seals.

**Clean**
• Old gasket and seals from the block and oil pan sealing surfaces.

**Install or Connect**
1. New rear oil pan seal to the rear main bearing cap.
2. New front oil pan seal to the timing gear cover. Press the retaining tips into the holes in the cover.
3. New oil pan to block gaskets to the block. Use gasket cement to hold them in place.
4. Oil pan bolts.
   • ¼-inch oil pan to block bolts to 9.0 N·m (80 in. lbs.).
   • 5/16-inch oil pan to block bolts to 18.6 N·m (165 in. lbs.).
   • Oil pan to timing gear cover to 5.1 N·m (45 in. lbs.).
5. Lower the engine.
6. Front engine mount through-bolts.
7. Torque converter or flywheel cover.
8. Proper quantity and grade of engine oil.
9. Battery negative cable.

**OIL PUMP REPLACEMENT**

**Remove or Disconnect**
1. Oil pan, as outlined previously.
2. Oil pump pickup tube bracket to main bearing cap nut.
3. Oil pump bolts.
4. Oil pump.

**Inspect**
• Oil pump pickup tube for looseness. If the tube is loose in the oil pump body, replace it, as outlined in the proper unit repair manual. A loose pickup tube can result in an air leak and loss of oil pressure.

**Install or Connect**
1. Oil pump to the engine. Align the slot in the oil pump shaft with the tang on the distributor shaft. The oil pump should slide easily into place. No gasket is used.
2. Oil pump bolts.
   • Oil pump bolts to 13.0 N·m (115 in. lbs.).
3. Oil pump pickup tube bracket to main bearing cap nut.
   • Nut to 34 N·m (25 ft. lbs.).
4. Oil pan, as outlined previously.

**REAR CRANKSHAFT OIL SEAL REPLACEMENT**

The rear main bearing oil seal can be replaced (both halves) without removal of the crankshaft. Always replace the upper and lower seal as a unit. Install the seal with the lip facing the front of the engine. Extreme care should be exercised when installing this seal to protect the sealing bead located in the channel on the outside diameter of the seal. An installation tool (figure 23) should be used to protect the seal bead when positioning the seal. (Some seal kits include the tool as part of the service kit).

**Remove or Disconnect (Figures 21 and 22)**
1. Oil pan, as outlined previously.
2. Rear main bearing cap.
3. Lower seal half (figure 21).
4. Upper seal half (figure 22).
   • Tap on the upper seal half, using a small drift and hammer.
   • Remove the upper seal half, using pliers.
Clean
- Sealing surfaces of the main bearing cap and block.

Inspect
- Crankshaft, seal channel, and sealing surfaces for nicks, scratches, etc.

Install or Connect (Figures 23, 24, and 25)
1. Upper seal half.
   ![Figure 22—Removing The Upper Seal Half](image)

   **Important**
   - An oil seal installation tool (figure 23) should be fabricated (if not provided in the seal kit) to prevent seal damage

during installation. Extreme care should be taken when installing this seal to protect the sealing bead located in the channel on the outside diameter of the seal.

- Coat the seal lips lightly with engine oil. Keep the oil off of the seal mating ends.
- Position the tip of the tool between the crankshaft and the seal seat in the block (figure 24).
- Position the seal half between the crankshaft and the tip of the tool. Make sure that the oil seal tip is positioned toward the front of the engine.
- Roll the seal around the crankshaft using the tool as a "shoe-horn" to protect the seal bead from the sharp corner of the seal seat surface in the block. The installation tool must remain in position until the seal half is properly positioned with both ends flush with the block.
- Remove the tool, being careful not to withdraw the seal half.

2. Lower seal half.
- Coat the seal lips lightly with engine oil. Keep the oil off of the seal mating ends.
- Insert the seal half into the rear main bearing cap. Use the tool to protect the seal half from the sharp edge of the rear seal seal. Feed the seal half into the rear main bearing cap, using light finger pressure. Make sure the oil seal lip faces the front of the engine (figure 24).

3. Rear main bearing cap with the lower main bearing.
- Apply a brush-on type oil sealing compound to the mating surface of the block and cap (figure 25). Do not allow any sealant on either crankshaft or rear oil seal.
- Apply engine oil to the lower main bearing.
- Position the cap to the block. Install the cap bolts.

**Tighten**
- Rear main bearing cap bolts temporarily to 14 N-m (10 ft. lbs.).
- Tap the end of the crankshaft first rearward then forward with a lead hammer. This will line up the rear main bearing and crankshaft thrust surfaces.

**Tighten**
- Rear main bearing cap bolts to 90 N-m (65 ft. lbs.).

4. Oil pan, as outlined previously.
5. The proper quantity and grade of engine oil.

**CHECKING VALVE TIMING**

Tool Required:
- J-8520-Dial Indicator Adaptor

When it becomes necessary to make a check of valve timing, the procedure following may be used:
1. Loosen the nut at the #1 intake valve rocker arm, swing the rocker arm away from the pushrod, then remove the pushrod.

2. Install a dial indicator, along with J-8520 (figure 26). Turn the crankshaft until the #2 exhaust valve opens and the notch on the damper is aligned with the "0" mark on the timing tab.

3. Position the dial indicator to measure lifter movement and set indicator at zero. Turn the crankshaft 360 degrees and read the indicator. On correctly timed engines the indicator will read 0.012-0.020-inch.

4. If the reading is not as shown, reset the indicator at zero and turn the crankshaft 360 degrees, then read the indicator again. If reading is now within specifications, the engine is timed properly.

5. The chart following shows indicator readings with gears properly indexed for 4.8L engines and the indicator readings resulting from improperly indexed gears.

**MEASURING CAMSHAFT LOBE LIFT**

Tool Required:
- J-8520 Dial Indicator Adaptor

To check for worn camshaft lobes, use the following procedure:
1. Remove the rocker arm as outlined previously.
2. Install a dial indicator (part of J-8520) (figure 26). Position the dial indicator so the plunger rests on the pushrod end, as shown. Make sure the pushrod is in the lifter socket.
3. Rotate the crankshaft slowly in the direction of rotation until the hydraulic lifter is on the heel of the cam lobe. At this point, the pushrod will be in its lowest position. Set dial indicator on zero, then rotate the crankshaft slowly until the pushrod is in the fully raised position.

4. Compare the total lift recorded from the dial indicator with specifications.

5. Continue to rotate the crankshaft until the indicator reads zero. This will be a check on the accuracy of the original indicator reading.

6. Remove the dial indicator and adaptor.

7. Install the rocker arm and adjust the valves as previously outlined.

**CAMSHAFT REPLACEMENT**

To check for worn camshaft lobes without disassembling the engine, refer to “Measuring Camshaft Lobe Lift” in this section.

**Inspect**
- Camshaft lobes and journals for scratches, pitting, and wear.
- Timing gear for damaged teeth.

**Measure (Figure 29)**
- Thrust plate to camshaft clearance. Use a feeler gage (figure 29). The proper clearance is 0.003-0.008-inch. If the clearance is excessive, replace the thrust plate. If the clearance is insufficient, replace the spacer ring. Refer to the proper unit repair manual.

**Camshaft Gear And Thrust Plate Replacement**
- Refer to the proper unit repair manual.

**Camshaft Bearing Replacement**
- Refer to the proper unit repair manual.

**Install or Connect (Figure 27)**
- Coat the camshaft lobes and journals with a high quality engine oil supplement (GM Engine Oil Supplement or equivalent).
Figure 29—Measuring Camshaft To Thrust Plate Clearance

1. Camshaft (90) to the engine. Handle the camshaft carefully to prevent damage to the camshaft bearings.

![Image of camshaft]

**Important**
- Line up the timing marks on the crankshaft gear and camshaft gear (figure 27).

2. Thrust plate bolts (94).

![Image of thrust plate bolts]

**Tighten**
- Thrust plate bolts to 9.0 N·m (80 in. lbs.).

**Measure**
- Camshaft and crankshaft gear run-out. Use a dial indicator. Camshaft gear run-out should not exceed 0.10 mm (0.004-inch), crankshaft gear run-out should not exceed 0.08 mm (0.003-inch). If gear run out is excessive, the gear will have to be removed and any burrs cleaned from the shaft or the gear will have to be replaced.
- Timing gear backlash. Use a dial indicator. The correct backlash is 0.10-0.15 mm (0.004-0.006-inch) with new parts, 0.20 mm (0.008-inch) maximum with used parts.

3. Timing gear cover, as outlined previously.
4. Torsional damper, as outlined previously.
5. Hydraulic lifters, as outlined previously.

**Important**
- Replace all hydraulic lifters, change the crankcase oil and filter, and add GM Engine Oil Suplement (or equivalent) to the engine oil if a new camshaft was installed.

7. Pushrod covers, as outlined previously.
8. Distributor. Refer to ENGINE ELECTRICAL (SEC. 6D).
9. Rocker arm cover, as outlined previously.
10. Fuel pump.
11. Air cleaner.
12. Radiator, fan, pulley, and shroud.
- Fill the cooling system with the proper quantity and grade of coolant.
13. Front end sheet metal, as required.

Figure 30—Replacing the Connecting Rod and Piston

**CONNECTING ROD AND PISTON REPLACEMENT**

**Remove or Disconnect (Figure 30)**

**Tool Required:**
- J-5239 Guide Set.

1. Cylinder head, as outlined previously.
2. Oil pan, as outlined previously.
3. Oil pump, as outlined previously (if necessary).
4. Ridge or deposits from the upper end of the cylinder bores.
- Turn the crankshaft until the piston is at BDC.
- Place a cloth on top of the piston.
- Perform the cutting operation with a ridge reamer.
- Turn the crankshaft until the piston is at TDC.
- Remove the cloth and cuttings.
5. Connecting rod cap. Check the connecting rod and cap for identification marks. Mark the parts if required. The connecting rod and cap must be kept together as mating parts.
6. Connecting rod and piston.
- Attach J-5239 to the connecting rod bolts (figure 30).
- Use the long guide rod of J-5239 to push the connecting rod and piston out of the bore.
7. Connecting rod bearing.

**Cleaning, Inspection, And Repair**
Clean, inspect and repair or replace the components as necessary. Measure connecting rod bearing clearance, piston clearance, ring clearances, etc. Refer to the proper unit repair manual.

The unit repair manual contains information on:
- Connecting rod and piston.
- Piston rings.
- Connecting rod and crankpin.
- Cylinder bores.
**Figure 31—Piston Ring Gap Location**

**Install or Connect (Figures 30 through 34)**

**Tools Required:**
- J-5239 Connecting Rod Guide Set
- J-8037 Ring Compressor
- Make sure the cylinder walls are clean. Lubricate the cylinder wall lightly with engine oil.
- Make sure the piston is installed in the matching cylinder.

1. **Connecting rod bearings.**
   - Be certain that the bearings are of the proper size.
   - Install the bearing inserts in the connecting rod and connecting rod cap.
   - Lubricate the bearings with engine oil.

2. **Piston and connecting rod to the proper bore.**
   - With the connecting rod cap removed, install J-5239 onto the connecting rod studs (figure 30).
   - Locate the piston ring end gaps as shown in figure 31. Lubricate the piston and rings with engine oil.
   - Without disturbing the ring end gap location, install J-8037 over the piston (figure 32).
   - The piston must be installed so that the piston crown depression's flat side faces to the engine's left side (figure 33).
   - Place the piston in its matching bore. Using light blows with a hammer handle, tap the piston down into its bore (figure 33). At the same time, from beneath the vehicle guide the connecting rod to the crankpin with J-5239 (figure 30). Hold the ring compressor against the block until all rings have entered the cylinder bore.
   - Remove J-5239 from the connecting rod bolts.

**Measure**
- Connecting rod bearing clearance. Refer to the proper unit repair manual.

3. **Connecting rod cap and bearing.**
4. **Connecting rod cap nuts.**

**Figure 32—Installing The Piston**

- **Tighten**
  - Connecting rod cap nuts to 60 N-m (44 ft. lbs.).

- **Measure**
  - Connecting rod side clearance. Use a feeler gage between the connecting rod and crankshaft (figure 34). The correct clearance is 0.006-0.017-inch.

5. **Oil pump (if removed), as outlined previously.**
6. **Oil pan and cylinder head, as outlined previously.**

**MAIN BEARING REPLACEMENT**

عناصر عربة هيدروليكية

**Remove or Disconnect (Figures 35 and 36)**

**Tool Required:**
- J-8080 Main Bearing Remover/Installer

1. Spark plugs.
2. Oil pan, as outlined previously.
3. Oil pump, as outlined previously.
4. Main bearing caps.
   - Check the main bearing caps for location markings. Mark the caps if necessary. The caps must be returned to their original locations during assembly.

5. Lower main bearing inserts from the main bearing caps.
6. Rear crankshaft oil seal, if necessary, as outlined previously.
7. Upper rear main bearing insert.
   - Use a small brass drift and hammer. Tap on the insert, on the side opposite the bearing tan, until the insert rotates out of position (figure 35).
   - Use a pair of pliers with the jaws taped to prevent damage to the crankshaft. Clamp the insert to the crankshaft flange (figure 35). Rotate the crankshaft to remove the bearing insert.
8. Upper main bearing inserts.
   - Insert J-8080 into the crankshaft oil hole (figure 35).
   - Rotate the crankshaft to “turn” the bearing insert out of the block.

**Cleaning, Inspection, And Repair**

Clean, inspect, and repair or replace the components as required. Refer to the proper unit repair manual. The unit repair manual contains information on:
- Crankshaft.
- Main and connecting rod bearings.
- Main bearing cap replacement (shimming procedure).

**Install or Connect (Figures 25, 35, 36, and 37)**

**Tool Required:**
- J-8080-Main Bearing Remover/Installer

Figure 35—Removing The Upper Rear Main Bearing Insert
4.8 LITER L6 6A7-19

Figure 36—Removing The Upper Main Bearing Insert

1. Upper rear main bearing insert.
   • Apply engine oil to an insert of the proper size.
   • Insert the plain end (without the bearing tang) of the insert between the crankshaft journal and the notched side of the block.
   • Use pliers with taped jaws to clamp the bearing to the crankshaft as shown in figure 35. Rotate the crankshaft to "roll" the insert into the block. Then seat the insert using a small drift and hammer.

2. Lower rear main bearing insert.
   • Apply engine oil to an insert of the proper size.
   • Press the insert into the rear main bearing cap.

3. Upper main bearing inserts.
   • Insert tool J-8080 into a crankshaft main bearing oil hole (figure 36).
   • Apply engine oil to inserts of the proper size.
   • Insert the plain end (without the bearing tang) of the insert between the crankshaft and the notched side of the block.
   • Rotate the crankshaft to "roll" the insert into the block.
   • Remove the tool.

4. Lower main bearing inserts to the main bearing caps.
   • Make sure the inserts are of the proper size.
   • Apply engine oil to the inserts.

5. Main bearing caps (except rear cap) and bolts to the block. Make sure the special bolt which retains the oil pump screen bracket is installed in the proper position. (#5 main bearing cap, camshaft side hole.)

6. Rear crankshaft oil seal to the block and main bearing cap, as outlined previously.

7. Rear main bearing cap to the block.
   • Apply a brush-on type oil sealing compound to the mating surface of the block and cap (figure 25). Do not allow any sealant on either crankshaft or rear oil seal.
   • Apply engine oil to the bearing insert.
   • Install the rear main bearing cap and bolts. Tighten the bolts temporarily to 14 N-m (10 ft. lbs.).

8. Oil pump, as outlined previously.

9. Oil pan, as outlined previously.

10. Spark plugs.

CRANKSHAFT GEAR REPLACEMENT

Remove or Disconnect (Figure 38)

Tool Required:
J-24420-A Puller.

1. Timing gear cover, as outlined previously.
2. Crankshaft gear. Use J-24220-A (figure 38).
Install or Connect (Figures 27 and 38)

Tool Required:

J-5590 Crankshaft Gear Installer.

Important

- Align the timing marks (figure 27).
- Timing gear cover, as outlined previously.

**OIL FILTER BYPASS VALVE REPLACEMENT**

Install or Connect (Figures 27 and 38)

1. Oil filter.

2. Oil filter relief valve. Pry it from the block with a screwdriver (figure 39).

**CRANKSHAFT REPLACEMENT**

1. Remove the engine.

2. Refer to the proper unit repair manual for crankshaft replacement procedure.

**FLYWHEEL REPLACEMENT**

Remove or Disconnect (Figure 40)

1. Transmission, clutch housing, and clutch.

2. Rear main bearing cap. Refer to “Rear Crankshaft Oil Seal Replacement” in this section.

- Mark the flywheel and crankshaft so the dowel pin holes can be aligned in their original positions at assembly (figure 40).
- Loosen the flywheel bolts a few turns.

3. Flywheel dowel pins.
   - Turn the crankshaft so that a dowel pin is at the 6 o'clock position.
   - Drive the dowel pin out, using a hammer and drift.
   - Repeat the preceding steps to drive out the remaining dowel pins. The crankshaft must be turned each time so that the pin can be driven out without contacting the block.

4. Flywheel bolts.

5. Flywheel.

Clean

- Mating surfaces of crankshaft and flywheel. Remove any burrs.

Inspect

- Flywheel for burning, scoring, warping, and wear. Replace the flywheel if necessary. Do not machine the flywheel.
- Flywheel ring gear for worn or broken teeth.
4.8 LITER L6 6A7-21

ENGINE MOUNTINGS

NOTICE: Broken or deteriorated mountings can cause misaligned and eventual destruction of certain drive train components. When a single mounting breakage occurs, the remaining mountings are subjected to abnormally high stresses.

INSPECTING ENGINE MOUNTINGS

Front Engine Mountings
1. Raise the engine to remove weight from the mountings and to place a slight tension on the rubber cushion. Observe both mountings while raising the engine.
2. Replace the mounting if the following conditions exist:
   - Hard rubber surface covered with heat check cracks.
   - Rubber cushion separated from the metal plate of the mounting.
   - Rubber cushion split through the center.
3. If there is movement between a metal plate of the mounting and its attaching point, tighten the bolts or nuts attaching the mounting to the engine, frame, or bracket.

Rear Mountings
1. Push up and pull down on the transmission tailshaft. Observe the transmission mounting.
2. Replace the mounting if the following conditions exist:
   - Rubber cushion separated from the metal plate of the mounting.
   - Mounting bottomed out (tailshaft can be moved up but not down).
3. If there is relative movement between a metal plate of the mounting and its attaching point, tighten the bolts or nuts attaching the mounting to the transmission or crossmember.

FRONT MOUNTING REPLACEMENT

Remove or Disconnect (Figures 41 and 42)

• Support the engine with a suitable lifting fixture. Do not load the engine mounting.
1. Engine mounting through-bolt and nut.
2. Mounting assembly bolts, nuts, and washers.

Install or Connect (Figures 41 and 42)

NOTICE: See “Notice” on page 6A7-1 of this section for steps 2 and 3.
1. Mounting assembly.
2. Mounting assembly bolts, nuts, and washers.

Figure 40—Flywheel Dowel Pin Hole Locations

Flywheel Ring Gear Replacement
1. Use a torch to heat the gear around the entire circumference, then drive the gear off the flywheel, using care not to damage the flywheel.

NOTICE: Never heat starter gear to red heat as this will change metal structure.

2. Uniformly heat the flywheel gear to temperature which will expand the gear to permit installation. Temperature must not exceed 204°F (400°F).
3. As soon as the gear has been heated, install on the flywheel.

Install or Connect (Figure 40)
1. Flywheel to the crankshaft. Align the marks made at disassembly. Make sure the dowel holes in the crankshaft and flywheel are aligned.
2. Flywheel.

Tighten
• Bolts to 150 N m (110 ft. lbs.).
3. Dowel pins.
• The interference fit dowel pins must be replaced with an oversized dowel pin when installing the flywheel.
• Ream the dowel pin holes to the proper size (0.4510-0.4517-inch).
• Tap the dowel pins into place, flush with the flywheel retaining bolt surface.
4. Rear main bearing cap. Refer to “Rear Crankshaft Oil Seal Replacement” in this section.

5. Transmission, clutch housing, and clutch.

Figure 40—Flywheel Dowel Pin Hole Locations

B-04556
Figure 41—Front Engine Mounting Brackets

Tighten
- Fasteners to specifications. Refer to figures 41 and 42.

3. Engine mount through-bolt and nut. Lower the engine until the bolt can be inserted. Install the nut.

Tighten
- Through-bolt or nut to specifications. Refer to figure 41.

REAR MOUNTING REPLACEMENT
(P-MODELS WITH TRANSMISSION TAIL MOUNTING)

Remove or Disconnect (Figure 43)
- Support the rear of the engine to relieve the weight on the rear mountings.
- Mounting to crossmember nut(s) and washer(s).
- Mounting to transmission bolts and washers.
- Raise the rear of the engine only enough to permit removal of the mounting.
- Mounting.

Install or Connect (Figure 43)
1. Mounting.
- Lower the rear of the engine.
2. Mounting to transmission bolts and washers.

NOTICE: See “Notice” on page 6A7-1 of this section.
3. Mounting to crossmember nut and washer.

REAR MOUNTING REPLACEMENT (P-MODELS WITH FLYWHEEL HOUSING MOUNTING)

 Remove or Disconnect (Figure 44)

1. Bolt, cushion and spacer.
   - Raise the rear of the engine only enough to permit removal of the mounting.

 Install or Connect (Figure 44)

1. Mounting. Align the hole in the mounting with the hole in the crossmember.
   - Lower the rear of the engine.

 NOTICE: See “Notice” on page 6A7-1 of this section.

2. Spacer, cushion and bolt.

 Tighten

- Bolt to 90 N·m (65 ft. lbs.).

ENGINE REPLACEMENT

Additional steps may be necessary on “P” models depending on body builder design.

 Remove or Disconnect

1. Battery negative cable.
2. Hood and sheet metal, as required.
3. Air cleaner.
4. Radiator.
5. Heater hoses from the engine.
6. Accelerator cable.
7. Transmission detent cable (if used).
8. Fan and water pump pulley.
9. Fuel lines from the fuel pump.
10. Evaporate emission and other vacuum hoses.
11. Engine wiring.
12. Starter.
13. Exhaust pipe at the exhaust manifold. Wire the pipe out of the way.
14. Flywheel cover.
15. Flywheel to torque converter bolts (automatic transmission).
   - Attach a suitable lifting device to the engine. Remove the weight from the engine mountings.
16. Front engine mounting through-bolts.
   - Support the transmission with a chain or transmission jack.
17. Bell housing to engine bolts.
18. Engine. Move the engine forward to disengage the transmission and remove.

 Install or Connect (Figure 41)

1. Engine. Move the engine rearward to engage the transmission.
2. Bell housing to engine bolts. Remove the transmission jack or support chain.
3. Front engine mounting through-bolts and nuts.

 Tighten

- Fasteners to specifications. Refer to figure 41.

4. Torque converter to flywheel bolts (automatic transmission).
5. Flywheel cover.
6. Exhaust pipe and new packing to the exhaust manifold.
7. Starter.
8. Engine wiring.
10. Fuel lines.
11. Fan and water pump pulley.
12. Transmission detent cable (if used).
15. Radiator.
16. Air cleaner.
17. Hood and sheet metal.
18. Battery negative cable.
19. Proper quantity and grade of coolant.

## DESCRIPTION

All R/V, G, and P series vehicles have pressure type engine cooling systems with thermostatic control of the coolant circulation. The cooling system is sealed by a pressure type radiator cap that causes the system to operate at higher than atmospheric pressure. This higher pressure operation raises the boiling point of the coolant, thereby increasing the cooling efficiency of the radiator. The 105 kPa (15 psi) pressure cap raises the boiling point of the coolant to approximately 125°C (258°F) at seal level.

The pressure-vacuum valve radiator cap allows the coolant to expand through the pressure valve in the center of the cap without building unnecessary pressure. This expanding coolant flows into the coolant reservoir. The vent valve closes due to expansion and coolant flow (the nominal 105 kPa (15 psi) pressure will not be reached until the system is working at maximum capacity). Any air or vapor in the cooling system will be forced into and out of the coolant reservoir through the vent tube at the top of the reservoir. As the system cools, the extra coolant in the reservoir will be drawn back to the radiator through the vent valve. In this manner, the radiator will keep itself full at all times.
SYSTEM CHECKS

EXHAUST LEAKS
To check for exhaust leaks into the cooling system, drain the system until the coolant level stands just above the top of the cylinder head(s), then disconnect the radiator upper hose and remove the thermostat and fan belt(s). Start the engine and accelerate several times. At the same time note any appreciable coolant rise or the appearance of bubbles which may indicate that exhaust gases are leaking into the cooling system.

NOTICE: A worn head gasket may allow exhaust gases to leak into the cooling system. This can damage the cooling system as the gases combine with the water to form acids which are harmful to the radiator and engine.

WATER PUMP
Check water pump operation by running the engine while squeezing the radiator upper hose. When the engine warms a pressure surge should be felt. Check for a plugged venthole in the pump.

RADIATOR
Test for restrictions in the radiator by warming the engine and then turning the engine off and feeling the radiator. The radiator should be hot along the left side and warm along the right side, with an even temperature rise from right to left. Cold spots in the radiator indicate clogged sections.

THERMOSTAT
Check the thermostat by hanging the thermostat on a hook in a 33% glycol solution, 25°C (4°F) above the temperature stamped on the thermostat valve. Submerge the valve and agitate the solution. The valve should open. Remove the thermostat and place it in a 33% glycol solution, -12°C (10°F) below the temperature indicated on the valve. With the valve submerged and coolant agitated, the valve should close.

OVERHEAT AND/OR NOISE
Restrictions in the cooling system can cause the engine to overheat and/or create cooling system noise.

Components prone to this condition are the cylinder head, water pump, block, thermostat housing and inlet manifold. Symptoms include:
- Engine may make snapping/cracking noises.
- Heater core may gurgle or surge.
- Radiator hoses may collapse and expand.
- Heater hoses may vibrate and thump.
- Overheat light may or may not come on.

Symptoms are the result of coolant boiling at some localized area and may be noticed after extending idling and/or while driving. Determine which side of the engine is involved and whether it is more at the front or rear of the engine.

Diagnosis/Inspection
1. Isolate the area by probing the engine with a sounding bar (large screwdriver).
2. With the radiator cap removed, observe the water being circulated in the radiator. Feel the front area of the radiator for cold spots which indicate blockage. Blocked radiators generally occur on units that have accrued miles and not on new vehicles.

CAUTION: The radiator cap should be removed from a cool engine only. If the radiator cap is removed from a hot cooling system, serious personal injury may result.
3. Inspect the thermostat to see if it opens.
4. Inspect the thermostat housing to make sure it is free of obstructions.
5. Remove the water pump from the vehicle and the back cover on the pump. Inspect internal passages using a flash light.
6. Inspect the cross over at the front of the inlet manifold. This entire passage can be seen with the thermostat removed.
7. Remove the heads, and check the block.
8. With the water pump and heads removed, inspect the coolant passages by using a pen light flash light. Replace the block if a restriction can be seen.
9. If none of the above inspections reveal the problem area, inspect the heads. Heads with blocked coolant passages generally have more than one area that is blocked. Inspect the heads for signs of overheat discoloration (a dark blue or black area). If none are found, look in the coolant passages for blockage and probe all accessible passages.

Use a substantial probe as a tag wire to go through or around a partially blocked area. If nothing is found by visual inspection and probing, inspect the passages for a rough, ragged appearance. The roughest internal passages are probably the ones that are blocked.
Replace a blocked or suspect head and inspect the replacement head before installation.

FAN CLUTCH DIAGNOSIS

NOISE
Fan noise is sometimes evident under the following normal conditions.
- When the clutch is engaged for maximum cooling.
- During the first few minutes after start-up until the clutch can re-distribute the silicone fluid back to its normal disengaged operating condition (after overnight settling).

Fan noise or an excessive roar will generally occur continuously under high engine speed conditions (2500 rpm and up) if the clutch assembly is locked up due to an internal failure. If the fan cannot be rotated by hand or there is a rough grating feel as the fan is turned, replace the clutch.
ENGINE COOLING 6B1-3

ENGINE OVERHEAT—BOILING—POOR ENGINE COOLING

1. RELIEVE PRESSURE AND CAREFULLY REMOVE THE RADICATOR CAP.
2. RUB 96.6°C (209°F) TEMPERATURE STICK* ONTO THE THERMOSTAT HOUSING.
3. WARM UP THE ENGINE AT FAST IDLE: WATCH FOR COOLANT FLOW BEFORE THE MARK BEGINS TO MELT.

COOLANT FLOW

PROBLEM IS CAUSED BY OTHER THAN BAD THERMOSTAT.

COLD ENGINE—SLOW WARMUP—NOT ENOUGH HEAT

1. RELIEVE PRESSURE AND CAREFULLY REMOVE THE RADICATOR CAP.
2. RUB 86.6°C (187°F) TEMPERATURE STICK* ONTO THERMOSTAT HOUSING.
3. WARM UP ENGINE AT FAST IDLE: WATCH FOR COOLANT FLOW BEFORE THE MARK BEGINS TO MELT.

COOLANT FLOW

NO COOLANT FLOW

NO COOLANT FLOW

PROBLEM IS CAUSED BY OTHER THAN BAD THERMOSTAT.

*NOTE: THE TEMPERATURE STICK IS A PENCIL LIKE DEVICE WHICH HAS A WAX MATERIAL CONTAINING CERTAIN CHEMICALS WHICH MELT AT A GIVEN TEMPERATURE. TEMPERATURE STICKS CAN BE USED TO DETERMINE A THERMOSTAT'S OPERATING TEMPERATURE BY RUBBING 86.6°C (187°F) AND 96.6°C (209°F) STICKS ON THE THERMOSTAT HOUSING. THE MARKS MADE BY THE STICKS SHOULD MELT WHEN COOLANT TEMPERATURES OF 86.6°C (187°F) AND 96.6°C (209°F) ARE REACHED, RESPECTIVELY. THESE TEMPERATURES ARE THE NORMAL OPERATING RANGE OF THE THERMOSTAT, THEREFORE, IF THE COOLANT FLOWS AS INDICATED ON THE DIAGNOSIS CHART, THE THERMOSTAT MAY BE WORN.

LOOSENESS

Check a loose fan assembly for any wear and replace if necessary. Under various temperature conditions a visible lateral movement that can be observed at the tip of the fan blade. This is a normal condition due to the type of bearing used. Approximately 6.5 mm (¼-inch) maximum lateral movement measured at the fan tip is allowable. This is not cause for replacement.

SILICONE FLUID LEAKS

The fan clutch operation is generally not affected by small fluid leaks which may occur in the area around the bearing assembly. If leakage appears excessive, replace the fan clutch (see below).

ENGINE OVERHEATING

If the fan and clutch assembly free-wheel with no drag (revolves more than five times when spun by hand), replace the clutch.

THERMOSTAT DIAGNOSIS

Refer to the thermostat diagnostic chart for thermostat diagnosis procedures (figure 1).

COOLANT LEVEL INDICATOR DIAGNOSIS

INDICATOR LAMP WILL NOT ILLUMINATE

1. Turn the ignition switch to the CRANK position.
   - If the lamp illuminates, the lamp is OK and the connector is properly installed on the module. Go to Step 2.
   - If the lamp does not illuminate, check the bulb, socket and wiring between the socket and the module connector and the connector on the module. Replace or repair as required.

2. Turn the ignition switch to the ON position and disconnect the electrical lead at the coolant level sensor on the radiator.

Figure 2—Cooling System Diagnosis Chart
If the lamp fails to illuminate, check the wiring between the coolant level sensor connector and the module for a short circuit to ground. If the circuit is OK, replace the module.

**INDICATOR LAMP REMAINS ILLUMINATED**

1. Turn the ignition switch to ON.
   - Check the coolant level. Add coolant if necessary.
   - If the lamp remains illuminated, go to Step 2.
2. Disconnect the electrical lead at the coolant level sensor on the radiator (use a jumper wire and "G" type electrical connector).
   - If the lamp does not illuminate, replace the sensor.
   - If the lamp remains illuminated, connect the electrical lead and go to Step 3.
3. Check for an open circuit between the sensor and the module.
   - If an open circuit is found, repair it.
   - If no open circuit is found, replace the module.

**COOLING SYSTEM DIAGNOSIS**

Refer to the cooling system diagnosis chart for detailed cooling system diagnostic procedures (figures 2 and 3).

**UNCOMMON COOLING SYSTEM PROBLEMS**

**PROBLEMS NOT REQUIRING DISASSEMBLY OF THE COOLING SYSTEM**

1. Locate and remove large obstructions blocking the radiator or the condenser.
   - Auxiliary oil cooler.
   - License plates.
   - Spare tires.
   - Ice, mud, or snow obstructing the grille.
2. Engine oil is overfilled.
3. Incorrect radiator for the application.
   - Check the part number.
4. Loose, damaged, or missing air seals.
5. Missing or damaged lower air baffle.
6. Incorrect ignition timing.

**PROBLEMS REQUIRING DISASSEMBLY OF THE COOLING SYSTEM**

1. Incorrect or damaged fan.
2. Worn or damaged emission system components.
   - "Could cause overheating at idle.
   - Damaged PCV valve, TVS or TCS.
3. Pressure check the cooling system with the pressure cap installed.
   - Shows if the pressure cap leaks because of radiator filler neck damage.
4. Worn or damaged water pump.
   - Impeller vanes eroded or broken.
   - Worn or damaged bearing and/or seal-check for shaft or bearing play.
5. Plugged radiator tubes.
   - Perform a flow check.
6. Internal system leaks.
   - Head gasket.
CRACKED BLOCK
7. Plugged coolant passages in the cylinder heads.
• Visual check.

ON VEHICLE SERVICE

FLUSHING THE COOLING SYSTEM

Various methods and equipment can be used to flush the cooling system. If special equipment is used, follow the equipment manufacturer’s instructions.

Important
• Remove the thermostat before flushing the cooling system.

COOLANT RECOVERY TANK REPLACEMENT

Remove or Disconnect (Figures 4, 5 and 6)
1. Coolant from the recovery tank (1).
2. Coolant overflow hose from the recovery tank (1).
3. Coolant recovery tank (1) from the vehicle.
   • Bolt/screw (2).

Install or Connect (Figures 4, 5 and 6)
1. Coolant recovery tank (1), to the vehicle.
   • Bolt/screw (2).

DEAERATION TANK REPLACEMENT

Remove or Disconnect (Figures 7, 8 and 9)
1. Coolant from the deaeration tank (10).
2. Overflow hose from the filler neck.
3. Return hose (12) from the deaeration tank (10).
4. Deaeration tank (10) from the vehicle.
   • For R/V and P vehicles; bolts/screws (7), and the retaining straps (8) from the support brackets (9) (figures 6 and 8).
   • For the G series vehicle; bolts/screws (7) and nut (6) (figure 7).
   • The deaeration tank (10) is free of the vehicle.

Install or Connect (Figures 7, 8 and 9)
1. Deaeration tank (10) to the vehicle.
   • For R/V and P vehicles; deaeration tank (10) onto the support brackets (9). Attach the retaining straps with bolts/screws around the tank and the lip on the support brackets (9).
   • For the G vehicle; deaeration tank (10) into position and attach with bolts/screws (7) and the nut (6).

Tighten
• Bolt/screws (7) and nut (6) to “Specifications.”
2. Return hose (12) to the deaeration tank (10).
3. Overflow hose to the filler neck.
4. Coolant into the deaeration tank (10).

THERMOSTAT REPLACEMENT

VEHICLES EXCEPT THOSE WITH 6.2L ENGINE

Remove or Disconnect (Figures 10 through 13)
1. Drain the cooling system until the radiator coolant level is below the thermostat.
2. Thermostat (23) from the vehicle.
   • Bolts (20) and the water outlet (21).
   • Thermostat from its housing.
   • Gasket.

Install or Connect (Figures 10, 11 and 12)
   • Make sure the thermostat housing and water outlet sealing surfaces are clean.
   1. Thermostat (23) in its housing.
   2. New gasket (22) into position.
   3. Water outlet (21).
      • Bolts (20).

Tighten
   • For bolts (20), refer to "Specifications."
4. Fill the cooling system.
5. Start the engine and run with the radiator cap removed until the radiator upper hose becomes hot (thermostat is open).
6. With the engine idling, add coolant to the radiator until the coolant level reaches the bottom of the filler neck.
7. Radiator cap to the radiator, making sure the arrows line up with the overflow tube.

VEHICLES WITH THE 6.2L ENGINE

Remove or Disconnect (Figures 14 and 15)
1. Upper fan shroud from the G vehicle.
   • Refer to RADIATOR (SEC. 6B2).

**Install or Connect (Figure 16)**
- Make sure the crossover sealing surfaces are clean.
- New gaskets (28) into position.
- Crossover (32) to the vehicle.
  - Bolts (27) and studs (26).

**Tighten**
- Bolts (27) to 47 N·m (35 ft. lbs.).
- Studs (26) to 47 N·m (35 ft. lbs.).
- Heater hose, upper radiator hose, and the bypass hose.

**DRIVE BELT REPLACEMENT**

**PULLEY INSPECTION**
Examine the pulleys for chips, nicks, tool marks, cracks, bent sidewalls, corrosion or other damage.

1. Place a straightedge or position a cord across the two pulleys so they touch at all points (figure 17).
2. Turn each pulley one half revolution and recheck with a straightedge or cord. Full contact at all points must be made. If contact is not made at all points, the pulley may be warped or its shaft could be bent. Replace any damaged parts.

**DRIVE BELT INSPECTION**
Replace frayed or cracked belts and tension to the proper specification. Do not use drive belt dressings to extend the belt life.
CAUTION: Avoid over or under-tightening drive belts. Loose belts result in slippage which can cause belt and pulley "glazing" and inefficient component operation. Once a belt has become "glazed," replace the belt. Loose belts can also place high impact loads on driven component bearings due to the whipping action of a loose belt. Over tightening belts can lead to bearing damage and early belt failure.

DRIVE BELT REPLACEMENT - V-BELT

1. Remove the old belt.
   - Loosen the component driven by the belt (figures 18 through 22).

   **NOTICE:** Place the belts into the pulley grooves by hand. Do not force a belt into a pulley groove by prying with a screwdriver, crowbar, or other wedge type tool. Prying a belt into position can damage both the belt and the belt drive components.

2. Install the new belt.
   - Tension the new belt to "Specifications"
   - Use J-23600-B to measure V-belt tension.
   - Place the gage at the center of the greatest span.

   **Tighten**
   - Component to mounting bracket fasteners to the "Specifications" at the end of this section.

3. Run the engine at idle speed for a minimum of 15 minutes.
   - This allows the belt to seat itself in the pulleys, causing the belt fibers to relax, or stretch.

4. Allow the drive belt to cool until it is cool or at most, warm to the touch. Not hot.

   **NOTICE:** A used belt is one that has been rotated at least one complete revolution on the engine pulleys. This begins the "seating" of the belt and it must never be tensioned to new belt specifications.

5. Check the belt tension.
   - Use J-23600-B to measure V-belt tension.
   - Place the gage at the center of the greatest span.
   - The belt tension should be at the maximum used belt specifications from the chart in "Specifications."

DRIVE BELT ADJUSTMENT - V-BELT

Never tension a used belt to more than its specified tension limit.

1. Check the belt tension.
   - Belt should be cool or at least warm to the touch. Not hot.
   - Use J-23600-B to measure V-belt tension.
   - Place the gage at the center of the greatest span.
   - If the belt is below the minimum "used belt" tension specification, adjust the belt.
2. Loosen the component in its mounting bracket (figures 18 through 22).
3. Tension the belt to the maximum used belt specification from the chart in "Specifications."

**Tighten**
- Component to mounting bracket fasteners to the specifications at the end of this section.
4. Run the engine at idle for a minimum of 15 minutes.
- This allows the belt to reseat itself in the pulleys.
5. Allow the drive belt to cool.
- Should be at most warm to the touch. Not hot.
6. Check the belt tension.
- Use J-23600-B to measure V-belt tension.
- Place the gage at the center of the greatest span.
- Re-adjust if not within the used belt specifications from the chart in "Specifications."
DRIVE BELT ROUTING

Refer to the drive belt routing diagrams if belt replacement becomes necessary. Refer to figures 23 to 32.

DRIVE BELT REPLACEMENT - SERPENTINE BELT
1. Remove the old belt (figure 33).
   - With a socket and breaker bar, release the tension by turning the tensioner pulley assembly. The tensioner pulley is sprung activated and it can be turned to the left or right to apply or release the pulley tension.

2. Install a new belt.
   - Thread the belt around the pulleys.
   - With a breaker bar apply the tension by turning the tensioner pulley assembly.

DRIVE BELT ROUTING - SERPENTINE BELT

Refer to drive belt routing diagrams if belt replacement becomes necessary (figure 33).

FAN AND FAN CLUTCH REPLACEMENT

Remove or Disconnect (Figure 34)
1. Radiator fan shroud.
   - Refer to RADIATOR (SEC. 6B2).

2. Fan (73) and fan clutch (74) from the water pump pulley (70).
   - Nuts (75).

3. Fan (73) from the fan clutch (74).
   - Bolts (72).

Install or Connect (Figure 34)
- Inspect the mating surfaces (the water pump hub and the fan clutch hub) for smoothness and rework as necessary to eliminate any burrs or other imperfections.
AUXILIARY COOLING FAN REPLACEMENT

The Auxiliary Cooling Fan is available when a 7.4L engine (RPO LE8) and Air Conditioning (C60, C69) are ordered. Its to provide additional cooling at low speed vehicle operations, extended idle, stop and go conditions, and when running the air conditioning system.

Remove or Disconnect (Figure 35)
1. Grille assembly.
   • Refer to SHEET METAL (SEC. 2B).
2. Fan harness connector (83).
3. Fan assembly (81) from the radiator support (80).
   • Bolts/screws (82).

Install or Connect (Figure 35)
1. Fan assembly (81) to the radiator support (80).
   • Bolts/screws (82).

CAUTION: Do not repair and reuse a fan with a bent or damaged blade. Replace the fan as an assembly. A damaged blade can change the balance of a fan. A fan out of balance could fly apart during use and create a dangerous condition to the owner and vehicle.

1. Fan (73) to the fan clutch (74).
   - Bolts (72) to 25 N·m (18 ft. lbs.).
2. Fan and clutch assembly to the water pump pulley (70).
   - Nuts (75). Align the yellow reference marks on the water pump hub and the fan clutch hub.
   - Nuts (75) to 25 N·m (18 ft. lbs.).
3. Fan shroud.
   - Refer to RADIATOR (SEC. 6B2).

4. Lower radiator hose and the heater hose from the water pump (91).
5. Water pump (91) from the engine block (figure 36).
   - Bolts (92, 93), and gasket (94).
   - Loosen the generator adjusting bolt to allow the brace to be moved away on vehicles where the brace will inhibit water pump removal.

**Install or Connect (Figures 36)**
- Clean the mating surfaces on the water pump and the engine block.
1. Water pump (91) to the engine block (figure 36).
   - New gasket (94) onto the water pump (91).
   - Place the generator adjusting brace back into position if moved.
   - Bolts (92 and 93).

**Tighten**
- Bolts (92 and 93) to the “Specifications” at the end of this section.
2. Lower radiator hose and the heater hose to the water pump (91).

SECTION 6B2
RADIATOR

DESCRIPTION

The radiator in the R/V, G and P series vehicles is a crossflow tube and center type. Refer to figures 1 through 4.

All radiators are fitted with a shroud designed to assist the fan in directing air flow through the radiator core and to also serve as a fan guard. Provision for coolant expansion is achieved with a coolant recovery tank. This retards coolant overflow, and reduces frequent refills.

Pressure is maintained in the radiator and system by a pressure cap. The pressure cap has two valves; one relieves excessive pressure and the other compensates for coolant contraction when the engine is stopped. Radiator caps are provided in 105 kPa (15 psi) rating on all models.

RADIATOR MAINTENANCE

Check the outside of the radiator for bent fins, or signs of leakage. Repair leaking radiator cores. Do not seal temporarily with a sealer type antifreeze or coolant additive. Remove any stones between the fins. Clean loose debris and road film from the radiator core with a quality grease solvent and compressed air. Direct the stream of solvent at the front of the core for more efficient cleaning.

To insure a thorough cleaning, remove the grille, fan guard, and fan shroud.

Remove the radiator cap and look for plugging and scale on the inside of the tank. Replace a badly plugged radiator. Test the radiator and system as described in ENGINE COOLING (SEC. 6B1).

1. Check the coolant level. If low, add recommended coolant as required.

2. Check the hose connections and tighten the clamps if leakage is evident. Replace cracked, stripped, or corroded clamps.

3. Check the coolant hoses for spongy or checked appearance. Replace deteriorated hoses or bursting could occur which would result in coolant loss and extensive engine damage due to overheating.

4. Check the radiator core for leaks and for accumulation of dirt which may obstruct the air passages and reduce heat transfer.

5. Check the surge tank or recovery tank for leaks. Plastic bottles may develop cracks for being damaged by flying objects. Check metal tanks at the weld seams.

6. Inspect the radiator rubber mountings and bumpers for deterioration and replace as necessary. Check the mounting bolts, supports, braces, tie rods, and stabilizer rods. Components should be securely fastened in place if mounting bolts are missing, loose, or stripped. Also check for damage to the core, side flanges, and supporting components.

Figure 4—P(42) — Radiator Mounting and Related Parts (Typical)
7. Check for clearance between the fan blades, core, and shroud. Check the fan attaching bolts for tightness and that none are missing. Replace the fan if any blade is bent. The distance between the blades and shroud should be equal around the perimeter of the shroud. Adjust as necessary after any adjustment has been made to the fan or the fan mounting bracket and hub.
8. Inspect the filler cap seal for evidence of cracking, separation, or deterioration. Replace as required.
9. To assist in maintaining efficient heat dissipation, an occasional external flushing with water will remove the majority of dirt accumulation and foreign matter from between core fins. Direct water under moderate pressure from behind the core to force debris out in the opposite direction of its entry. Direct the water stream in line with the fins to reduce the possibility of bending fins.

RADIATOR INTERNAL DEPOSITS
A radiator that has a dirty, obstructed core or is leaking will cause the engine to overheat. A scale deposit inside the radiator is a result of using hard, high mineral content water in the cooling system. The effect of heat on the minerals in the water causes the formation of scale, or hard coating, on metal surfaces within the radiator, thereby reducing the transfer of heat. Some hard water will produce a silt-like deposit which restricts the flow of water. This must be flushed out at least twice a year — more often if necessary.

SCALE REMOVAL
To remove the hardened scale, a direct chemical action is necessary. A flushing compound at the specified rate of 30 grams per liter (4 oz. per gallon) of radiator capacity, should be added to the coolant water in the form of a dissolved solution while the engine is running. Operate the engine for 15 minutes, then drain and flush the system with clean water.

There are various types of flushing compounds commercially available and should be obtained from a reliable source. Most compounds attack metals and should not remain in the engine for more than a few minutes. Use a neutralizer after a descaling solvent is used.

For extremely hard, stubborn coatings, such as lime scale, use a stronger solution. The corrosive action of a stronger solution will affect the thin metals of the radiator, thereby reducing its operating life. A complete flushing and rinsing is mandatory and must be accomplished skillfully.

After using the solvent and neutralizer and flushing the cooling system, drain the system and fill it with clean, soft water plus a rust inhibitor or high boiling point type antifreeze. After filling the cooling system, check for radiator, hose, and engine coolant leaks.

RADIATOR REPLACEMENT
The type of radiator core mounting varies according to model and engine type. Radiator assembly includes a shroud and may include an oil cooler in the core. Some models have a separate power steering oil cooler attached in front of the radiator core. On models so equipped it may be necessary to remove the oil cooler to facilitate removal of the radiator core. Refer to POWER STEERING (SEC. 3B3) in this manual for oil cooler removal and installation.

18. Install the radiator pressure cap, making sure the arrows line up with the overflow tube.

**PRESSURE CAP**

The pressure relief valve assembly, integral with the filler cap, incorporates a pressure valve and a vacuum valve (figure 14). When pressure in the system reaches the valve setting, the pressure valve opens and vapor is allowed to escape.
As liquid in the system cools it contracts; this allows the pressure valve to close and also creates a partial vacuum in the system. Atmospheric pressure acting through the overflow tube unseats the vacuum valve and allows air to enter the system. The overflow pipe connects to the valve outside the valve seal; thus no liquid or air can escape from the system when both valves are in the closed position.

The radiator filler cap is constructed with a spring-loaded rubber seal which is pressed firmly against the surface of the filler neck seat when the cap is installed. The rubber seal must be in good condition and the top of the radiator filler neck must be clean and smooth to form an airtight seal. The seal of the filler cap and the operation of the pressure relief valve can be checked using a conventional cooling system testing kit (figure 15).

When the engine is at normal operating temperature or above, the internal pressure buildup in the cooling system will blow out scalding fluid and vapors if the radiator cap is suddenly removed. To prevent loss of coolant and the danger of being burned check or add coolant when the engine is cool. If the cap must be removed when the engine is hot, place a cloth over the cap and rotate the cap slowly counterclockwise to first stop and allow pressure to escape. The cap and filler neck meet at right angles in a safety detent position. The cap locking tank is flat and the filler neck has a straight tab (figure 16). To turn the cap beyond this point and remove the cap, the cap must be pressed down to clear the safety detent and turned counterclockwise.

**COOLANT RECOVERY SYSTEM**

The coolant recovery system consists of a reservoir, pressure cap, and interconnecting hose.

Maintain the coolant level between the "HOT LEVEL" and "COLD LEVEL" markings on the tank. Refer to figures 1, 2, 3 and 4.

The pressure cap is similar to the radiator filler cap but has a gasket (figure 17). This gasket forms a seal at the radiator filler neck. A leak at this gasket will result in loss
of coolant during normal operation. Install the pressure cap so that the markings on top of the cap align with the overflow tube on the filler neck (figure 18).

**SURGE TANK**

The tank serves as a coolant reservoir for the radiator core. Hoses and pipes connect the tank to the radiator and water pump. The surge tank incorporates the cooling system filler cap.

At regular intervals check the tank and connecting hoses for leaks. Keep the hose clamps and mounting bolts tightened.

Check the mounting brackets and supports for cracks and broken attaching parts. Check insulators and straps; if deteriorated or loose from wear, replace.

**ALUMINUM RADIATOR REPAIR**

**DESCRIPTION**

This radiator utilizes an aluminum core with plastic side tanks. The core and side tanks can be replaced separately and core repair is easily made with the hot melt adhesive method. A transmission oil cooler is located in one of the side tanks. The oil coolers can be replaced. The drain cock is located on the lower part of one of the tanks. The drain cock is also serviceable.

**CORE**

The core is made of aluminum and is of the crossflow design. It utilizes large tubes that resist plugging, and repairs to the tubes and core are easily made using the hot melt adhesive method.

The core is attached to the tanks by clinched tabs on the core that can be bent back if tank or core replacement is required.

If the damage to a tube is too severe, a tube can be blocked or plugged as explained in “Tube Blocking.” No more than two tubes should ever be blocked on a core. Also replace the core if more than three tabs are broken on one side or if two adjacent tabs are broken.

**TANKS**

The tanks are attached to the core by clinched tabs attached to the sides of the core. The clinched tabs can be bent back if the tanks need to be removed from the core. Bend the tabs back only enough to remove the tank. Overbending will weaken the tabs.

A high temperature rubber gasket is used to seal the mating surface between the core and the tank (figure 19). The gasket must be replaced any time a tank is removed from the core.

**TRANSMISSION OIL COOLER**

Replace the oil cooler by removing the tank from the core.

A leaking oil cooler gasket can be replaced without removing the tank from the core.

**DRAIN COCK**

The aluminum/plastic radiator utilizes a two piece plastic drain cock and a rubber seal. The drain cock is serviceable (figure 20).

**DIAGNOSIS**

**LEAK TESTING**

Some core leaks can be detected by adding water to the radiator. Clean the core so that the damaged area can be found.

1. Remove dirt and insects from the fins with a common water hose without a nozzle. Excessive water pressure could damage the fins.
2. Scrub the core with a soft-bristle brush using clean, hot water or hot water with a mild detergent solution.

**On-Vehicle Pressure Testing**

You can pressure-test the aluminum-plastic radiator with J-24460-01 with J-23699 (figure 21). With the system at a cool temperature, remove the radiator cap, connect the gage, and apply normal system operating pressure. Do not exceed 138 kPa (20 psi). Watch the gage needle for an indication of a leak, and examine the radiator and other cooling system parts for escaping coolant.

Repair all hose and hose connections as required. Check the radiator cap to ensure that it will maintain the correct pressure.

If the radiator leaks during the pressure test, mark the leak area.
Off-Vehicle Leak Testing

NOTICE: Do not use boil-out tanks or vats or other tanks that have been used for copper and brass radiators. The flux, acid, and caustic cleaners remaining in these tanks will attack the aluminum and cause radiator failure. A separate test tank containing clean water is recommended for servicing aluminum/plastic radiators.

1. Install test fittings or rubber test caps in the inlet and outlet necks and seal the oil cooler fittings with metal plugs to protect the cooler and keep the fluid from running out (figure 22).
2. Attach the pressure tester and gradually apply air pressure until 138 kPa (20 psi) is attained. Do not exceed 138 kPa (20 psi). Check the pressure gage to see if there is a pressure loss. To ensure that there are no small leaks, run water over the repair area and look for bubbles. (A mild detergent is helpful).

If a large water tank is available, submerge the radiator and a check for air bubbles.

REPAIRABLE LEAKS
There are two types of leaks that can be repaired on the aluminum-plastic radiator: core leaks and gasket leaks. Leaks in the plastic tanks cannot be repaired (figure 23). Core leaks can occur in a tube or in the joints between the tubes and headers. Gasket leaks can occur in the joints between the plastic tanks and the headers or in the joints between the oil cooler fittings and the tank. Some leaks can be repaired while the radiator is on the vehicle; however, it is usually best to remove the radiator.

Repair Methods
There are several methods that can be used to repair the radiator core, but the hot melt adhesive method is the most effective.

The kit contains adhesive sticks, cotton swabs, a wire brush and the primer. The adhesive stick is reusable, has an indefinite shelf life and is waste-free. Store the in a sealed container to keep them dry (figure 24).

ALUMINUM RADIATOR SERVICE
The aluminum-plastic radiator can be repaired at the dealership. The following components are easily replaced:

- Core
- Tanks and gaskets
- Oil coolers and gaskets
- Drain cock and gasket

The tanks cannot be repaired if broken or cracked. The radiator core can be replaced and the new core used with the original tanks and oil cooler.
PRECAUTIONS
As with all cooling system service, take measures to prevent personal injury and damage to the system.

CAUTION: To help avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot. Scalding fluid and steam can be blown out under pressure if the cap is taken off too soon.

NOTICE: DO NOT USE "BOIL OUT" TANKS OR VATS. Common service methods may destroy an aluminum radiator. Do not use caustic or lye cleaning solutions for aluminum radiators. USE CLEAN WATER WHEN SERVICING ALUMINUM RADIATORS.

- Do not open the hood if you can see or hear steam or coolant escaping from the engine compartment.
- Do not remove the radiator cap if the radiator feels warm.
- Do not remove the radiator cap or coolant recovery tank cap if the coolant in the recovery tank looks like it is boiling.
- Wear eye protection.
- Wear gloves to protect your hands against excessive heat or the effects of chemicals on your skin.
- Prevent dirt and water from entering the transmission oil cooler.
- Do not use boil-out tanks or vats or other tanks that have been used for copper and brass radiators. The flux, acid, and caustic cleaners remaining in these tanks will attack the aluminum and cause radiator failure. A separate test tank containing clean water is recommended for servicing aluminum/plastic radiators.

NOTICE: Never use shop air to pressure test radiators that is not regulated at 138 kPa (20 psi). Pressures over 138 kPa (20 psi) will damage the radiator.

SPECIAL PREPARATION
For damaged areas that are between the cooling fins, it may be necessary to remove some of the fins. Do not remove more fins than necessary. Usually 6 mm (1/4-inch) beyond the leak or damage area is enough to make an effective repair (figure 25).

TUBE BLOCKING
If a tube is severely damaged, it can be blocked off (figure 26).

NOTICE: Do not block off more than two tubes in a radiator. Blocking off more than two tubes will reduce the cooling capability of the system.

Cut the tube off 6 mm (1/4-inch) from the header and pinch shut before it is cleaned and sealed. Refer to "General Core Sealing."

HEADER REPAIR
If the header or a tube near the header requires a repair, the side tank does not have to be removed. Place a damp cloth against the side tank where the repair has to be made (figure 27). The side tank can be submerged in a tank of water up to the header (figure 28).

A. Apply With A Wet Cloth

Figure 27—Using A Wet Cloth to Cool the Side Tank
A. Submerge The Tank—Keep The Header Above The Water Line

NOTICE: One of these procedures have to be used when repairs are made on or near the header to prevent damage to the tank or gasket.

GENERAL CORE REPAIR
Preparation of the surface in the repair area cannot be overemphasized. If the leak area surface is not clean, none of the repair materials will stick to the surface.

1. Position the core so the repair area is accessible.
2. Apply a wet cloth if you are working near the plastic tanks or the joints between the core tubes and header (figure 27); or submerge the tank in water (figure 28).
3. Heat the repair area slightly with a small torch or heat gun to be sure it is dry. Do not use a blow torch.
4. Brush the area to be repaired with the small steel brush that is supplied in the kit and blow dust away from the repair area (figure 29).
5. Open the tube of primer, using the spurred cap or a pin, and apply primer to the repair area only. Use of the primer produces a stronger repair. Do not heat the primer.
6. Scrub the repair area with a cotton swab until a fresh swab stays clean. The clear, yellow-brown coating does not have to be removed (figure 30).
7. Heat the repair area with a heat gun or by moving the torch in a circular pattern (figure 31). Use a soft, small blue flame (like a gas stove flame).
8. Withdraw the torch and rub the adhesive stick on the repair area (figure 32). The adhesive will flow at a temperature of approximately 260°C (500°F). If the stick doesn’t start to melt, remove it and reapply the heat. Do not heat the stick directly with a flame. High heat will burn and char the adhesive.
9. Continue heating until the adhesive flows and wets the entire repair area and fills the joint. If a hole is in the center of a tube, heat the tube and let the hot surface melt and pull in the adhesive. The force of the flame or heat gun will also tend to guide the adhesive toward the hole. For leaks between a tube and header, flow the adhesive around the tube and header joint with the tank installed.

A. Touch The Adhesive To The Hot Metal

**Figure 32—Apply Hot Melt Adhesive to the Repair Area**

10. Heat the repair area until the adhesive is bubble-free and smooth, with a light yellow color. Curing is not required.
11. Test the radiator when cool. If the repair area still leaks, reheat it gently to dry it. Heat and reflow the adhesive or apply more as necessary to repair the leak.

**TANK GASKET LEAK REPAIR**

Tank gasket leaks can be mistaken for tank or header leaks. If a plastic tank leaks from the header joint gasket, tighten the clinch tabs with locking-type pliers (figure 33). If this method doesn't seal the leak, remove the tank for further inspection.

1. Pry open the clinch tabs, except those under the inlet, outlet, and filler necks, using J-33419-1 or a screwdriver (figure 34). Lift the tabs only enough to allow removal.

**NOTICE: Do not overbend the tabs. Overbending could result in breakage. If there are more than 3 tabs broken on one side of the header, or more than 2 adjacent tabs together, replace the core.**

2. Lift the tank and slide it out from under the remaining clinched tab. You may have to tap the tank with your hand to dislodge the gasket. Lift the remaining tab(s) with pliers.
3. Remove and discard the gasket.

4. Clean the header and gasket groove of all dirt and old rubber.
5. Clean the sealing edge of the plastic tank.
6. Examine the header gasket surface and tank flange for leakage, and clean or repair the surface to remove dirt, burrs, and bumps.
7. Remove the oil cooler, if equipped, and install it in the new tank, if used.
8. Dip or coat the new tank gasket in engine coolant and position it on the header surface. The coolant helps hold the gasket in place.
9. Position the tank and gasket to the header, clamp it in place and secure it by bending four clinch tabs as shown in figure 35.
10. Clamp remaining clinch tabs around the header using the clinching tool or pliers (figure 36).

**NOTICE: Tighten the clinch tabs by starting at the center and working out to the ends.**

11. Replace the core if there are more than three tabs broken on one side or two adjacent tabs broken.
12. Install the drain cock, if removed.
13. Test the radiator for leaks.

Remove or Disconnect (Figure 37)
1. Radiator and lay it on a flat surface.
2. Bottom oil cooler nut and loosen the top nut.
3. Press the oil cooler into the hole and remove the gasket using a small hook (figure 37).
4. Flow-dry all surfaces on the tank and oil cooler.

Install or Connect (Figure 37)
1. Gasket without lubrication.
   • Be sure it is seated properly inside the tip of the fitting.
   • Reach into the oil cooler and push it into position against the tank.
2. Oil cooler nuts.

Tighten
• Nuts to 20 N·m (15 ft. lbs.).
• Do not overtighten.
3. Leak test.
4. Radiator to the vehicle.

RECORE
If the radiator core is damaged beyond repair and the other parts are serviceable, install the original inlet and outlet tanks, oil cooler, radiator cap, and drain valve, along with the new core and new gaskets.

| All new GM vehicles are certified by the United States Environmental Protection Agency as conforming to the requirements of the regulations for the control of air pollution from new motor vehicles. This certification is contingent on certain adjustments being set to factory standards. In most cases, these adjustment points either have been permanently sealed and/or made inaccessible to prevent indiscriminate or routine adjustment in the field. For this reason, the factory procedure for temporarily removing plugs, cap, etc., for purposes of servicing the product, must be strictly followed and, wherever practicable, returned to the original intent of the design. For vehicles sold in Canada and equipped with non-closed loop engines, also refer to the appropriate Canadian service manual supplement.

#### DESCRIPTION

This section covers information for carbureted and diesel engines only. For fuel system information on TBI equipped vehicles, refer to the "Fuel And Emissions Service Manual."
AIR CLEANER

CAUTION: The air cleaner also functions as a flame arrester in the event of engine backfire. The air cleaner should be installed at all times unless its removal is necessary for repair or maintenance. To help reduce the risk of personal injury and property damage, be sure that no one is near the engine compartment before starting the engine with the air cleaner removed. If engine backfire occurs with the air cleaner removed, there could be a burst of flame and possibly other fire in the engine compartment.

On vehicles with diesel engines, do not use starting fluids—immediate engine damage can result. Also take care not to let objects fall into the engine if the air cleaner is removed. If the engine is running, suction can pull loose objects into the engine. Objects pulled or dropped into the engine can cause costly engine damage.

When replacement of the air cleaner filter element is necessary, an AC air filter element is recommended. Refer to “MAINTENANCE AND LUBRICATION” (SEC. 0B) for change intervals. Operation of the vehicle in dusty areas will necessitate more frequent replacement.

CARBURETED ENGINE FUEL FILTERS

The fuel filter element should be replaced at the intervals shown in MAINTENANCE AND LUBRICATION (SEC. 0B). Fuel filter elements are of the throw away type and should be replaced, not cleaned.

Internal fuel filters are located in the inlet fitting of the carburetor (Figure 1). The filter element (3) is placed in the inlet hole with the gasket (2) surface outward. A spring (4) pushes out against the element and compresses the gasket (2) against the fuel inlet nut (1). A check valve is also built into the filter element.

FUEL FILTER REPLACEMENT

Remove or Disconnect

1. Fuel line connection at the fuel inlet nut (1).
2. Fuel inlet nut (1).
3. Filter element (3), gasket (2), and spring (4).

Install or Connect (Figure 1)

1. Spring (4).
2. Filter element (3).
   - The inlet check valve must be installed in the filter element to meet Motor Vehicle Safety Standards (M.V.S.S.) for roll-over.
   - The new filter element must include the check valve.
   - The check valve end of the filter element must face toward the fuel line.
3. Fuel inlet nut (1).

FUEL FILTERS

**Notice:** Extreme care should be taken when removing the filter element. Remove the filter element slowly to prevent dirt from falling into the engine.

Remove or Disconnect

1. Wing nut.
2. Air cleaner cover from the base.
3. Air filter element.
4. All accumulated dirt from the base.

Inspect

- Filter element for damage or excessive dirt accumulation. Replace as necessary.
- Seals or gaskets for damage.

Install or Connect

1. Air filter element.
2. Air cleaner cover.
3. Wing nut.

Tighten

- Fuel inlet nut to "Specifications" at the end of this section.
4. Fuel line.
- Start the engine and check for leaks.

DIESEL ENGINE FUEL FILTERS

The diesel engine fuel filter is an inline type filter which combines several different functions. It acts as a filter, water separator, water detector, water drain, and a fuel heater (Figure 2).

The first stage of the filter element is a water coalesor. The coalesor element combines small droplets of water into larger drops. The water collects in the bottom of the filter element for draining. The fuel then passes through the second stage of the filter element which is a paper filter.

The filter acts as a water detector by turning on the “WATER IN FUEL” light on the instrument panel. The probe of the water detector will touch water when 65 ml (2.2 fluid ounces) of water has collected in the filter. This completes a circuit through the water to the cover assembly which turns on the “WATER IN FUEL” light.

NOTICE: If the “WATER IN FUEL” light comes on and the fuel system is not purged of water, fuel injection system damage may result.

When the light comes on, the filter should be drained as soon as practical, but within one to two hours of engine operation.

A water drain is located in the bottom of the fuel filter assembly. By opening the water drain valve, water that has collected in the bottom of the filter element can be drained.

A fuel heater is located in the fuel filter assembly to help prevent fuel waxing. The heater thermostat turns the heater on at about 0°C (32°F) and off at about 30°C (80°F). The heater uses 7 to 13 amps depending on fuel temperature.

DRAINING THE FUEL FILTER
1. Turn off the engine and apply the parking brake.
2. Remove the fuel filler cap to release any pressure or vacuum in the fuel tank.
3. Place a suitable container under the filter drain hose.
**CAUTION:** The water/diesel fuel mixture is flammable, and could be hot. To help avoid personal injury and/or property damage, do not touch the fuel coming from the drain hose, and do not expose the fuel to open flames or sparks.

Be sure you do not overfill the container. Heat (such as from the engine) can cause the fuel to expand. If the container is too full, fuel could be forced out of the container. This could lead to a fire and the risk of personal injury and/or vehicle damage.

4. Open the drain valve (7) two to three turns (figure 2).
5. Start the engine and allow it to idle for one to two minutes or until clear fuel is observed.
6. Stop the engine and close the drain valve (7).
7. Install the fuel filler cap.
8. Dispose of the drained mixture in a proper manner.

**DIESEL FUEL FILTER REPLACEMENT**

**Remove or Disconnect (Figure 2)**

1. Fuel filler cap to release any pressure or vacuum in the fuel tank.
2. Both bail wires (8).
   - Drain fuel from the filter by opening the air bleed (10) and the water drain valve (7).
     - Allow the fuel to drain into a suitable container.
3. Fuel filter element (9).

**Clean**

- Any dirt from the fuel sealing surfaces of the filter element and the filter adapter (11).

**Install or Connect (Figure 2)**

1. New filter element.
2. Bail wires.
   - Close the drain valve (7).
3. A 3 mm (1/8-inch) inside diameter hose to the air bleed port (12).
4. The other end of the hose into a suitable container.
   - Disconnect the fuel injection pump shut-off solenoid wire.

**NOTICE:** If the engine is to be cranked or started with the air cleaner removed, take care not to let objects fall into the engine. If the engine is running, suction can pull loose objects into the engine. Objects pulled or dropped into the engine can cause costly engine damage.

- Crank the engine for 10 to 15 seconds and then wait one minute for the starter motor to cool. Repeat until clear fuel is observed coming from the air bleed.
- Close the air bleed.
5. Injection pump solenoid wire.
- Start the engine and allow it to idle for five minutes.
- Check the fuel filter for leaks.
FUEL SYSTEM 6C-5

DIESEL FUEL FILTER ASSEMBLY COMPONENT REPLACEMENT

All component parts of the fuel filter assembly are serviceable. These components include the filter adapter, restriction switch, fuel heater, and the water sensor (figure 2).

Always replace any damaged or worn O-rings, gaskets, or seals. After replacing components, bleed air from the filter to save cranking time. Start the engine and check for leaks after replacing components.

FUEL PUMP

All carbureted and diesel engines use a mechanical fuel pump located on the front right side of the engine. The pump is a diaphragm type pump and is actuated by a rocker arm through a link and pull rod.

Some engines have a special fuel pump that has a metering outlet for a vapor return system. Any vapor that forms is returned to the fuel tank along with hot fuel. This reduces the chance of vapor lock because cool fuel from the tank is always circulated through the fuel pump.

The fuel pump rocker arm is moved back and forth by a rod which rides on an eccentric on the engine camshaft. The rocker arm pulls down on the pump diaphragm against spring pressure. This causes a vacuum in the pump chamber which draws fuel from the tank through the inlet valve. The camshaft rotates and releases pressure on the rocker arm. This allows the spring to act on the diaphragm and force fuel out of the pump chamber through the outlet valve and into the fuel line to the carburetor or diesel fuel injection pump.

When the carburetor float rises and closes the needle valve, fuel cannot leave the pump chamber. The spring is held compressed by the fuel pressure in the pump chamber. The rocker arm idles on the cam eccentric and only moves enough to maintain pressure on the spring. A constant pressure is maintained on the fuel in the line to the carburetor. This pressure is proportional to the force of the spring.

When the immediate fuel needs of the diesel engine are satisfied, pressure builds in the fuel line and pump chamber. This pressure forces the diaphragm/piston to make shorter and shorter strokes, until more fuel is needed in the engine.

FUEL PUMP TESTS (CARBURETED ENGINE)

Inspect:
- Make certain that there is fuel in the tank.
- For leaks at all fuel connections from the fuel tank to the carburetor.
  - The engine should be running.
  - Tighten any loose connections.
- All hoses for flattening or kinks that would restrict the flow of fuel.
- Air leaks or restrictions on the suction side of the fuel pump will seriously affect pump output.

FUEL PUMP FLOW TEST
1. Remove the fuel supply line from the carburetor or fuel injection pump and insert it into a suitable container.
2. Crank the engine.
3. The fuel pump should supply 237 ml (1/2-pint) or more in 15 seconds.
4. If the flow is insufficient, check for a restriction.
5. If there are no restrictions, check fuel pump vacuum and/or pressure.

FUEL PUMP PRESSURE TEST
1. Disconnect the fuel inlet line at the carburetor.
2. Install a low pressure gage to the line.
3. Start the engine.
4. Fuel pump pressure should be 27.5 to 44.8 kPa (4 to 6 1/2 psi).
5. If the pressure is low, check for restrictions in the fuel tank sender unit filter, lines, and hoses.

NOTICE: Hold the carburetor fuel inlet nut while tightening the fuel line fitting to prevent carburetor damage.

6. Connect the fuel inlet line to the carburetor.

FUEL PUMP VACUUM TEST
1. Disconnect the inlet hose at the fuel pump and connect a vacuum gage.
2. Crank or run the engine until the maximum vacuum is reached.
3. If the vacuum is less than 50.6 kPa (15-inches Hg), replace the fuel pump.
4. If the vacuum is 50.6 kPa (15-inches Hg), check the fuel lines and hoses for leaks, kinks, or splits by disconnecting each section of line and connecting a vacuum gage. Crank or run the engine until the maximum vacuum is reached. The vacuum should be at least 50.6 kPa (15-inches Hg).

FUEL PUMP TESTS (DIESEL ENGINE)

Inspect:
- Make certain that there is fuel in the tank.
- For leaks at all fuel connections from the fuel tank to the injection pump.
  - The engine should be running.
  - Tighten any loose connections.
FUEL PUMP FLOW TEST

Remove or Disconnect

1. Fuel line at the fuel filter inlet.
2. Fuel injection pump electric shut-off solenoid wire (pink wire).
3. Place a suitable container at the end of the fuel filter inlet line.
4. Crank the engine for 15 seconds.
5. The fuel pump should supply 237 ml (1/2-pint) or more in 15 seconds.

FUEL PUMP PRESSURE TEST

1. Disconnect the fuel line at the inlet to the fuel filter assembly.
2. Place a low pressure gage to the line.
3. Crank or run the engine for 10 to 15 seconds.
4. Fuel pressure should be 38 to 45 kPa (5.5 to 6.5 psi).

FUEL PUMP VACUUM TEST

1. Disconnect the inlet line at the fuel pump.
2. Connect a vacuum gage to the fuel pump inlet.
3. Start the engine.
   - The engine will use fuel from the filter assembly.
4. Vacuum should be 41 kPa (12-inches Hg) or greater.
5. Replace the pump if vacuum is less than 41 kPa (12-inches Hg).

FUEL PUMP REPLACEMENT

ALL ENGINES EXCEPT 7.4L

Remove or Disconnect (Figures 3 through 5)

1. Fuel pipes and hoses from the fuel pump (25).
2. Bolts (26).
3. Fuel pump (25).
4. Gasket (27).
FUEL SYSTEM 6C-7

5. Bolts (28).
7. Gasket (30).
8. The push rod (31) (if necessary).

**Install or Connect (Figures 3 through 5)**

1. The push rod (if removed).
   - Apply some chassis grease to the rod to hold it up against the camshaft.
2. New gasket (30).

**Tighten**
- Bolts to specification.
5. New gasket (27).
7. Bolts (26).

7.4L ENGINE

**Remove or Disconnect (Figure 6)**

1. Fuel pipes and hoses from the fuel pump (35).
2. Bolts (36).
3. Fuel pump (35).
4. Gasket (37).
5. Plug (38).
6. The push rod (39).

**Install or Connect (Figure 6)**

1. The push rod (39).
   - Apply some chassis grease to the rod and hold it up against the camshaft.
2. Gasket sealer to the threads on the plug (38).
3. Plug (38).
4. Gasket (37).
5. Fuel pump (35).

**Tighten**
- Bolts alternately and evenly to 37 N·m (27 ft. lbs.).
7. Fuel pipes and hoses to the fuel pump.
   - If it is difficult to start the outlet fitting, disconnect the line at the carburetor.
   - Start the engine and check for leaks.

FUEL TANK

The fuel tank is located under the rear or the sides of the vehicle. The fuel tank is held in place by two metal straps that are attached to the underbody. Anti-squeak strips are used between the tank and the straps to reduce rattles and squeaks.

The fuel tank, filler cap, and fuel lines should be checked for damage which could cause leakage. Replace any damaged or worn parts.

Before servicing the fuel tank or lines:
- Disconnect the negative battery cable from the battery.
- Place "NO SMOKING" signs near work areas.
- Have a CO₂ fire extinguisher nearby.
- Wear safety glasses.
- Siphon or pump fuel into an explosion proof container.

DRAINING THE FUEL TANK

**Remove or Disconnect**

1. Negative battery cable.
   - There are two batteries in diesel engine vehicles.
   - Have a dry chemical (Class B) fire extinguisher in the work area.
2. Fuel filler cap.

CAUTION: Never drain or store gasoline or diesel fuel in an open container due to the possibility of fire or explosion.

3. Fuel through the filler tube using a hand operated pump.
6C-8 FUEL SYSTEM

- If a hand operated pump cannot be used to complete the draining, use a siphon at the main (not return) fuel pipe at the fuel pump or the fuel gage sending unit.

Install or Connect
1. Any lines or hoses.
2. Fuel filler cap.
3. Negative battery cable.

FUEL SYSTEM CLEANING (CARBURETED ENGINE)

CAUTION: This procedure will not remove all fuel vapor. Do not attempt any repair on the tank or filler neck where heat or flame is required, as an explosion resulting in personal injury could occur.

Contaminated fuel or other foreign material in the tank can usually be removed by cleaning; however, if the fuel tank is rusted internally, it should be replaced.

Remove or Disconnect
Tool Required:
J-24187 Fuel Gage Sending Unit Tool
1. Negative battery cable.
2. Engine harness connector at the distributor.
   - Have a dry chemical (Class B) fire extinguisher near the work area.
3. Fuel from the fuel tank.
   - Refer to "Draining the Fuel Tank."
4. Fuel tank.
   - Refer to "Fuel Tank Removal."
5. Fuel filter. Replace the filter if it is plugged.
   - Locate the tank away from heat, flame, or other sources of ignition.
   - If the strainer is contaminated or clogged, a new strainer should be installed upon reassembly.
7. Remaining fuel from the tank by rocking the tank.
   - Make sure that the water is completely removed.
8. Water from the fuel tank by rocking the tank.

Clean
- Fuel lines by applying air pressure in the opposite direction of fuel flow in the line.

Install or Connect
Tool Required:
J-24187 Fuel Gage Sending Unit Tool
1. Lines and pipes.
2. New strainer on the fuel gage sending unit (if necessary).
   - Use low air pressure to clean the pipes of the fuel gage sending unit.
   - Fittings to 30 N·m (22 ft. lbs.).
3. New fuel gage sending unit gasket.

NOTICE: Take care not to fold or twist the strainer when installing the sending unit as this will restrict fuel flow.

5. Fuel tank.
6. Fuel gage wire harness to the body harness.
7. All fuel lines.
8. A hose to the carburetor inlet line.
   - Disconnect the inlet line from the carburetor.
9. The other end of the hose into a four liter (one gallon) fuel can.
11. Six gallons of clean gasoline into the fuel tank.
   - Crank the engine until the fuel can is about one-half full. This will purge the fuel pump.
   - Do not overheat the starter.
12. Carburetor inlet line to the carburetor.
   - Check all connections for leaks and tighten all hose clamps.
13. Engine harness connector to the distributor.

DIESEL FUEL SYSTEM CONTAMINATION

Fungi and other micro-organisms can survive and multiply in diesel fuel if water is present. The fungi can be present in any part of the fuel handling system. These fungi grow into long strings and will form into large globules. The growths appear slimy and are usually black, green, or brown. The fungi may grow anywhere in the fuel but are most plentiful where diesel fuel and water meet. As the fuel is agitated (when service station tanks are being filled), fungi are distributed throughout the tank and may be pumped into a vehicle.

Fungi use the fuel as their main energy supply and need only trace amounts of water and minerals. As they grow and multiply, they change fuel into water, sludge, acids, and products of metabolism. The most common symptom is fuel filter plugging; however, various metal components (fuel tank, lines, and injection pump) can corrode.

CAUTION: To avoid personal injury, do not come into physical contact with biocides.

If fungi have caused fuel system problems, use a diesel fuel biocide to sterilize the fuel system. Do not exceed the dosage recommended on the label. Discontinue the use of a biocide when towing a trailer. It is permissible to have biocide in the fuel when starting to tow, but do not add any biocide while towing.

Steam cleaning may be necessary if most of the fungus growth cannot be removed with biocides.
FUEL SYSTEM CLEANING (DIESEL ENGINE)

CAUTION: Never drain or store diesel fuel in an open container due to the possibility of fire or explosion.

WATER IN THE FUEL SYSTEM

Remove or Disconnect
1. Battery cables.
2. Fuel from the tank.
   • Refer to "Draining the Fuel Tank."
3. Fuel tank.
4. Fuel gage sending unit.

Clean
• Fuel tank.
   — The tank should be replaced if it is rusted internally.
   • The pick-up filter or replace if necessary.
   • The check valve assembly.
5. Main fuel hose at the fuel pump.
6. Fuel return line at the injection pump.
   • Use low air pressure to blow out the lines toward the rear of the vehicle.
   — Replace the pipes if they are rusted internally.
7. Fuel injection pump shut-off solenoid wire.

Install or Connect
1. Fuel gage sending unit.
2. Fuel tank.
3. Fuel lines to the tank.
4. Clean diesel fuel into the tank until it is 1/4 full.
5. Fuel tank cap.
6. Fuel hoses to the fuel pump.
7. Battery cables.
   • Crank the engine for 15 seconds with one minute cooling periods until clean fuel is pumped out.
   — Use a suitable container to catch the fuel.
8. New fuel filter. Refer to "Diesel Fuel Filter Replacement."
9. A hose from the return line at the fuel injection pump to a closed metal container with a capacity of at least 8L (2-gallons).
   • If the engine temperature is above 52°C (125°F), activate the HPCA (Housing Pressure Cold Advance) on the injection pump. This can be done by disconnecting the two lead connectors at the Engine Temperature Switch and bridging the connector with a jumper wire.
   • Crank the engine for 15 seconds with one minute cooling periods until clean fuel appears at the return line.
10. Two lead connectors to the Engine Temperature Switch.
    • Remove the jumper wire.
    • Disconnect the lead to the HPCA solenoid (on the injection pump).
    • Crack open each injection line at the nozzle. Use two wrenches to prevent nozzle damage.

11. HPCA lead to the injection pump.

Tighten
• Injection line to nozzle fitting to 25 N·m (20 ft. lbs.).
   — Use two wrenches to prevent nozzle damage.
• Start the engine and allow it to idle for 15 minutes.
   — Make sure the fuel return line is in the metal container and that the container does not overflow.
   • Remove the hose from the metal container.
13. Fuel return line to the injection pump.
• Check for leaks.

GASOLINE IN THE FUEL SYSTEM

Engine Will Run Or Start
1. Drain the fuel tank.
2. Fill the tank with diesel fuel.
3. Run the engine for 15 minutes.

Engine Will Not Run
1. Drain the fuel tank.
2. Fill the tank with diesel fuel.
3. Remove the fuel injection pump shut-off solenoid wire.
4. Remove the fuel line between the fuel filter and the injection pump.
5. Connect a hose to the fuel filter outlet and run it to a closed metal container.
6. Crank the engine for 15 seconds with one minute cooling periods to purge gasoline from the system.
7. Install the fuel line between the fuel filter and the injection pump.
8. If the engine temperature is above 52°C (125°F), activate the HPCA (Housing Pressure Cold Advance) on the injection pump. This can be done by disconnecting the two lead connectors at the Engine Temperature Switch and bridging the connector with a jumper wire.
9. Install the fuel injection pump shut-off solenoid wire.
10. Start the engine and remove the jumper wire.
11. Connect the two lead connector.
12. Run the engine for 15 minutes.

FUEL TANK PURGING

The fuel tank should be purged before being repaired.

Remove or Disconnect
1. Fuel tank from the vehicle.
2. Fuel gage sending unit.
3. All remaining fuel from the tank.

Inspect
• Fuel tank for any remaining fuel.
**FUEL TANK FILLER NECK**

A restrictor and deflector is built into the fuel filler neck on gasoline engine vehicles to help prevent refueling with leaded gasoline. The opening in the restrictor will only admit the smaller unleaded gas nozzle spout. The nozzle must be fully inserted to bypass the deflector (figures 10 through 12).

**FUEL FILLER CAP**

The fuel tank filler neck is equipped with a screw type cap. The cap requires several turns counterclockwise to remove. The long threaded area allows fuel tank pressure to escape while the cap is being removed. A torque limiting device prevents overtightening. To install, turn the cap clockwise until a clicking noise is heard.

**NOTICE:** If a fuel filler cap requires replacement, use only a cap with the same features. Failure to use the correct cap can result in a serious malfunction of the system.

**FUEL LINES**

**NOTICE:** Fuel and vapor hoses and pipes are specially manufactured. It is important to use replacement hose or pipe meeting GM Specifications. Hoses and pipes not meeting GM Specification could cause early failure or failure to meet emission standards.

When replacing fuel feed and return pipes, always use welded steel tubing meeting GM Specification 124 M or its equivalent. The replacement pipe must have the same type fittings as the original pipes to ensure integrity of the connection.

- Never replace fuel pipe with copper or aluminum tubing.
- Check and replace any damaged O-rings or washers.
- Fuel pipes should be inspected occasionally for leaks, dents, or kinks.
- Follow the same routing as the original pipe.
- Pipes must be properly secured to the frame to prevent chafing. A minimum clearance of 6 mm (1/4-inch) must be maintained to prevent contact and chafing.

**FUEL AND VAPOR HOSES**

**NOTICE:** Fuel and vapor hoses are specially manufactured. It is important to use replacement hoses that meet GM Specification 6163-M. These hoses are identified by the word “Fluoroelastomer” marked on them. Hoses not so marked could cause early failure or failure to meet emission standards.

Do not use rubber hose within 10 cm (4-inches) of any part of the exhaust system or within 25 cm (10-inches) of the catalytic converter.

Figure 10—R/V Filler Neck

Figure 11—Chassis Cab Filler Neck

Figure 12—G-Van Filler Neck
Diesel engine vehicles have a check valve that will permit fuel to pass if the tank filter becomes plugged with paraffin during cold weather operation.

When this plugging occurs, the last four gallons of fuel will not be used due to the location of the check valve. Therefore it is important to keep the fuel tank above the 1/4 mark at temperatures below -6°C (-20°F) when using number two diesel fuel.

**FUEL GAGE SENDING UNIT**

The fuel gage sending unit is mounted in the top of the fuel tank. It is held in place by a cam lock ring. A gasket is used between the tank and the sending unit.

Sending units have either two or three nipples to attach hoses. These hoses are the fuel feed, fuel return, and vapor hoses.

On some sending units a wire is attached to the unit; while on other sending units, connectors attach directly to the sender.

**IN TANK FUEL FILTER**

A woven plastic filter is located on the lower end of the fuel pickup tube in the fuel tank (figure 13). This filter prevents dirt and water from entering into the fuel line unless it becomes completely submerged in water. The filter is self cleaning and normally requires no maintenance. Fuel stoppage at this point indicates that the fuel tank contains an abnormal amount of sediment or water and should be thoroughly cleaned.

**FUEL TANK SELECTOR VALVE**

The fuel tank selector valve is operated by a switch on the instrument panel. The switch controls fuel tank switching and fuel gage indication in a single operation.

A simple check can be made to determine if the fuel tank selector valve is working by listening for selector valve motor operation when the switch is pressed.

**DIAGNOSIS OF SELECTOR VALVE**

**CHECKING THE INSTRUMENT PANEL SIDE OF THE HARNESS**

Refer to figures 14 through 16 to diagnose the instrument panel side of the selector valve harness.

**CHECKING THE SELECTOR VALVE SIDE OF THE HARNESS**

1. Make sure there is about 40 liters (10 gallons) of fuel in one tank and about 20 liters (5 gallons) in the other tank.
2. Remove the harness connector from the fuel tank selector valve.
3. Install a known good selector valve.
4. Activate the fuel tank selector switch and note the gage readings of the right and left tanks.
5. The system is operating properly if a change is indicated between the tanks. Therefore, the original selector valve was the problem.
6. If a change is not indicated, there is an open in the harness between the connector on the cowl and the selector valve.
7. Refer to INSTRUMENT PANEL (SEC. 8C) if the fuel gage does not register accurately.

**FUEL TANK SELECTOR VALVE REPLACEMENT**

**Remove or Disconnect (Figure 13)**

Tool Required:
- J-24187 Fuel Gage Sending Unit Tool
1. Fuel from the tank.
2. Fuel tank from the vehicle.
3. Locking cam (50) using J-24187.
4. Fuel gage sending unit (51).

Figure 16—Auxiliary Fuel Tank Instrument Panel Wiring
ACCELERATOR CONTROLS

The accelerator pedal controls the throttle through a cable. There are no linkage adjustments. The throttle cable must be replaced with an identical replacement part.

All linkages and cables must be checked to assure free movement with no rubbing, chafing, or binding. The throttle must operate freely without binding between full closed and wide open throttle.

ACCELERATOR CONTROL CABLE

Observe the following when performing service on the accelerator control cable.

- The retainer must be installed with the tangs secured over the head of the stud (figure 18).
- The conduit fitting at both ends of the cable must have the locking tangs expanded and locked into the attaching holes.
- The braided portion of the cable must not come into contact with the front of dash sealer during replacement.
- Flexible components (hoses, wires, conduit, etc.) must not be routed within 50 mm (2-inches) of the moving parts of the accelerator linkage unless routing is positively controlled.
- Lube all pivot points with Accelerator Linkage Lubricant (1052541 or equivalent).

ACCELERATOR PEDAL

Observe the following when performing service on the accelerator pedal.

- The mounting surface between the support and the dash panel must be free of insulation. The carpet and padding in the pedal and tunnel area must be
positioned to lay flat and be free of wrinkles and bunches.

- Slip the accelerator control cable through the slot in the rod before installing the retainer in the rod. Make sure it is seated properly. Use care in pressing the retainer into the hole so the cable is not kinked or damaged (figure 19).
- The linkage must operate freely without binding between closed throttle and full throttle.
- Wire, hoses, cable, and other flexible components must not be placed within 13 mm (0.52-inch) of the cable or rod at any point in their travel.

Special Tools

All new GM vehicles are certified by the United States Environmental Protection Agency as conforming to the requirements of the regulations for the control of air pollution from new motor vehicles. This certification is contingent on certain adjustments being set to factory standards. In most cases, these adjustment points either have been permanently sealed and/or made in accessible to prevent indiscriminate or routine adjustment in the field. For this reason the factory procedure for temporarily removing plugs, cap, etc., for purposes of servicing the product, must be strictly followed and, wherever practicable, returned to the original intent of the design. For vehicles sold in Canada and equipped with non-closed loop engines, also refer to the appropriate Canadian service manual supplement.
CARBURETOR MODEL 1MEF

Model 1MEF carburetors are single bore downdraft carburetors using a triple venturi along with a discharge tube nozzle (figure 1).

A power valve piston assembly and metering rod control the fuel flow in the main metering and power systems of the carburetor. The tapered metering rod is attached to the power piston and moves in a fixed metering jet to provide the fuel flow for varying engine demands. On 1MEF carburetors, a factory set metering rod adjusting screw controls the position of the metering rod in the jet. This screw is located in the air horn and should not be turned as this could result in engine damage or increased exhaust emissions.

Model 1MEF incorporates an integral automatic choke system which uses an electrically heated choke coil. The vacuum diaphragm unit is mounted externally on the air horn and connects to the thermostatic coil lever through a connecting link.

The electric choke coil is contained in a choke housing, which is mounted on a bracket attached to the float bowl. Special rivets are installed to retain the factory setting of the choke coil and provide a non-adjustable design.

An integral, pleated-paper fuel inlet filter is mounted in the fuel bowl behind the fuel inlet nut to give maximum filtration of incoming fuel. A check valve is used in the filter inlet to prevent fuel draining from the fuel system after rollover.

To improve hot engine starting and meet evaporative emission requirements, fuel vapors from the carburetor bowl are vented to a vapor canister on some models. A tube (location F) is added to the air horn to connect the air horn and canister.

Other features of the carburetors include an aluminum throttle body for decreased weight and improved heat distribution. A thick throttle body to bowl insulator gasket keeps excessive engine heat from the float bowl.

All 1MEF models have seals added in the float bowl to seal the power piston drive rod and the pump lever. This prevents fuel vapors from escaping to atmosphere. During unit repair, the seals and retainer, where used, must be removed prior to immersion of the float bowl in carburetor cleaner.

The carburetor model identification is stamped on a vertical portion of the float bowl, adjacent to the fuel inlet nut (figure 2).

If replacing the float bowl, follow the manufacturer's instructions contained in the service package so that the identification number can be transferred to the new float bowl.

An electrically operated idle stop solenoid and dual throttle return springs are used on all carburetors.

The throttle lever has a spun-in plastic bushing which is used as a bearing surface. The bushing will withstand normal cleaning time in an approved cold immersion type carburetor cleaner. The bushing is not serviced separately and should not be removed from the carburetor throttle lever.

Six basic systems of operation are used (figures 3 through 8).

8. Check float level, and adjust if necessary.  
9. Check power piston operation: push piston down against piston rod and release; it should move freely in bore and return to its up position. Rotate throttle to wide open; piston should move upward in bore.  
If piston does not move freely, clean power piston and bore.  
If piston does not return when depressed, or does not move upward when throttle is opened, check for missing or damaged parts. Replace as necessary.  
10. Inspect metering rod hanger for damage. Replace power piston assembly if necessary. Adjust metering rod to specification. |

### ON-VEHICLE SERVICE (1MEF)

#### ELECTRIC CHOKE

**Inspect**

- Remove the air cleaner. With the engine off, hold the throttle half open. Open and close the choke several times. Watch linkage to be certain all links are connected and there are no signs of damage.

- If the choke or linkage binds, sticks, or works sluggishly, clean it with Choke Cleaner X-20-A or equivalent. Use cleaner as directed on the can. Refer to the disassembly instructions for additional direction if cleaning does not correct the problem. Do not lubricate the linkage.

- Visually inspect the carburetor to be certain all vacuum hoses are connected. Inspect hoses for cracks, abrasions, hardness or other signs of deterioration. Replace or correct as necessary.

- The vacuum break diaphragm shaft should be fully extended when the engine is off. If the shaft is not fully extended, replace the vacuum break assembly. Start engine — the vacuum break diaphragm shaft should fully retract within 10 seconds. If the unit fails to retract, replace the vacuum break assembly.

- Allow the choke to cool so that when the throttle is opened slightly, the choke blade fully closes. This check must be performed at an ambient temperature of about 21°C (70°F).

- Start the engine and determine the time required for the choke blade to reach its’ full open position. (Start timing when the engine starts.) If the choke plate fails to open fully within five minutes, proceed with the remaining steps.

- Check voltage at the choke heater connection with the engine running. If the voltage is approximately 12-15 volts, replace the electric choke unit. If the voltage is low or zero, check all wires and
connections. If the connections at the oil pressure switch are dirty or corroded, the oil warning lamp will be off with the ignition switch "On" and the engine off. If the fuse is blown, the radio or turn signal indicator will be inoperative. Repair wires or replace fuses as necessary.

- If all wiring and fuses are good, replace the oil pressure switch.

**Remove or Disconnect**

1. Air cleaner.
2. The choke electrical connector.
3. Rivet heads and retainers.
   - Align a #21 drill (0.156-inch) on the rivet head and drill only enough to remove the rivet head (figure 9).
   - Use a drift and a small hammer to drive the remainder of the rivets from the choke housing.
   - Use care in drilling to prevent damage to the choke cover or housing.
4. The choke cover assembly from the housing.
5. The choke coil from the housing.

**Install or Connect**

1. The choke cover and coil assembly in the choke housing.
   - Align the notch in the cover with the raised casting projection on the housing cover flange.
   - Make sure the coil pick-up tang engages the inside choke coil lever.
2. Retainers and rivets using a suitable blind rivet installing tool (figure 10).
3. Electrical connector.
   - Start the engine and check the operation of the choke.
4. Air cleaner.

---

**Figure 9—Drilling the Choke Coil Rivets**

**Figure 10—Installing the Choke Coil Rivets**

**IDLE SOLENOID**

**Inspect**

1. Turn on the engine control switch, but do not start the engine.
2. Open the throttle to allow the solenoid plunger to extend.
3. Hold the throttle lever wide open, feel the end of the plunger and disconnect the wire at the solenoid.
4. Plunger should move. Some spring tension should be felt.
5. If the plunger did not move, back out ¼ hex screw (counter clockwise) one full turn and repeat step 3 and 4.
6. If the plunger moves in step 5, connect the wire to the solenoid and adjust the idle speed.
7. If the plunger did not move in step 5, insert test light (1893 bulb or smaller) between the solenoid feed wire and ground.
8. If the light lights, replace the solenoid.
9. If the light does not light, locate the cause of the open circuit in the solenoid feed wire.

**Remove or Disconnect**

1. Air cleaner.
2. Electrical connector from the solenoid.
3. Solenoid from the float bowl assembly.

**Install or Connect**

1. Solenoid.
   - Hold the choke valve wide open so the fast idle cam follower clears the fast idle cam.
   - Turn the solenoid until it contacts the lever tang.
2. Electrical connector.
3. Air cleaner.
   - Check and adjust the idle speed.
CARBURETOR REPLACEMENT

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carburetor. To aid in diagnosing the cause, the carburetor should be removed carefully from the engine without draining fuel from the bowl. Contents of the fuel bowl may then be examined for foreign materials as the carburetor is disassembled.

**Remove or Disconnect (Figure 11)**
1. Air cleaner assembly.
2. Fuel and vacuum lines from the carburetor.
   • Make note of the vacuum hose routing.
3. Electrical connectors for the choke and idle solenoid.
4. Accelerator linkage.
5. Carburetor attaching nuts.
6. Carburetor.
7. Insulator gaskets and heat shield.

**Clean**
- All traces of the old gasket from the carburetor flange and intake manifold.

**Install or Connect (Figure 11)**
1. Heat shield and insulator gaskets to the intake manifold.

CAUTION: Extinguish all open flames while filling and testing carburetor with gasoline to avoid personal injury.

2. Carburetor.
   • It is good shop practice to fill the carburetor float bowl before installing the carburetor. This reduces the strain on the starting motor and battery and reduces the possibility of backfiring while attempting to start the engine. Operate the throttle several times and check the discharge from pump jets before installing the carburetor.

3. Carburetor attaching nuts.

**Tighten**
- Both nuts to 4.1 N-m (36 in. lbs.) and then both nuts to 22 N-m (16 ft. lbs.).

4. Accelerator linkage.
5. Electrical connectors for the choke and idle solenoid.
6. Fuel and vacuum lines. Refer to the Emission Control Label, if necessary, for vacuum line routing information.
7. Air cleaner.

**Adjust**
- Idle speed, as outlined later.

CARBURETOR ADJUSTMENTS

A carburetor is designed to meet the particular requirements of the engine, transmission and vehicle and although they may look alike, they are not usually interchangeable. Refer to carburetor part number and/or specifications when making adjustments.

Before suspecting the carburetor as the cause of poor engine performance or rough idle; check the ignition system including distributor, timing, spark plugs and wires. Check the air cleaner, evaporative emission system, EFE System, PCV system, EGR valve and engine compression. Also inspect intake manifold, vacuum hoses and connections for leaks and check torques of carburetor mounting bolts/nuts.

Make all adjustments with the engine at normal operating temperature, choke full open, and the air cleaner installed. Except as noted, air conditioning should be "off" and all vacuum lines and all electrical leads connected. Refer to "Specifications" at the end of this section for carburetor adjustment specifications. Gages and tools for making adjustments are included in the Universal Gage J-9789D.

IDLE MIXTURE ADJUSTMENT

In the case of a major carburetor overhaul, throttle body replacement, or high idle CO as indicated by an emissions inspection, the idle mixture may be adjusted. Adjusting the mixture by other than the following method may violate Federal and/or state laws.

Tool Required:
J-29030-B Idle Mixture Needle Socket

1. Set parking brake and block drive wheels.
2. Remove the carburetor from the engine.
3. Drain the fuel from the carburetor into a container.
4. Remove the idle mixture needle plug (figure 12).
   - Invert carburetor, and support it to avoid damaging external components.
   - Make two parallel hacksaw cuts in the throttle body, between the locator points near the idle mixture needle plug. The distance between the cuts depends on the size of the punch to be used.
     - Cut down to the plug, but not more than 1/8-inch beyond the locator point.
   - Place a flat punch at a point near the ends of the saw marks. Hold the punch at a 45° angle, and drive it into the throttle body to break the casting away, to expose the plug.
   - Use a center punch to break the plug apart, to uncover idle mixture needle.
     - Remove all loose pieces of plug.
5. Reinstall the carburetor on the engine.
6. Place the transmission in PARK (automatic transmission) or NEUTRAL (manual transmission).

7. Start the engine and bring it to a normal operating temperature, choke valve open, and the air conditioning off.
8. Connect an ACCURATE tachometer to the engine.
9. Check the ignition timing, and adjust if necessary, by following the procedure described on the Vehicle Emission Control Information label.
10. Use J-29030-B to turn the mixture needle (1/8 turn at time), in or out, to obtain the highest RPM (Best Idle).
11. Adjust the idle speed solenoid to obtain the curb idle speed on the Emission Control Information label.
12. Again try to readjust the mixture needle to obtain the highest idle RPM. The adjustment is correct when the highest RPM (Best Idle) is reached with the minimum number of mixture needle turns from the seated position.
13. If necessary, readjust the idle speed solenoid to obtain the specified curb idle speed.
14. Check and if necessary, adjust the base idle speed solenoid (solenoid deactivated) and the fast idle speed to the specification shown on the Emission Control Information label.
15. Turn off the engine, and remove the block from the drive wheels.

IDLE SPEED ADJUSTMENT (Figure 13)

1. Engine must be warm with the choke wide open.
2. The fast idle cam follower must be off the steps of the cam.
   - See the Emission Control Information label.
3. Set the curb idle to specification. Turn the solenoid in or out to adjust RPM.
   - The solenoid should be energized.
4. Turn a 1/8" Hex screw to adjust the low idle speed to 450 RPM.
   - The solenoid should not be energized.
FAST IDLE ADJUSTMENT (Figure 14)
1. Prepare the vehicle for adjustments according to the Emission Control Information label.
   - Ignition timing must be set per label
2. Adjust the curb idle speed with the idle stop solenoid.
3. Place the cam follower tang on the high step of the cam.
4. Support the lever with pliers and bend the tang in or out to obtain the specified fast idle RPM.

CHOKE COIL LEVER ADJUSTMENT (Figure 15)
1. Place the fast idle cam follower on the highest step of the fast idle cam.
2. Hold the choke valve completely closed.
3. Bend the link to adjust.
   - A 3 mm (0.120-inch) plug gage must pass through the hole in the lever and enter the hole in the casting.

CHOKE ROD (FAST IDLE CAM) ADJUSTMENT (Figure 16)
1. With the fast idle adjustment made, the fast idle cam follower must be held firmly on the second step of the fast idle cam and against the highest step.
2. Hold down on the choke valve so the rod is in the end of the slot.
3. Gage between the lower edge of the choke valve (at the center) and the inside air horn wall.
   - Refer to "Specifications."
4. Bend the rod at point A to adjust.

CHOKE UNLOADER ADJUSTMENT (Figure 17)
1. If the choke coil is warm, cool it down to the point where the choke valve will close fully.
2. Hold the throttle valve wide open.
3. Gage between the lower edge of the choke valve and the inside of the air horn.
4. Bend the tang to adjust.
VACUUM BREAK ADJUSTMENT (Figure 18)
1. Place the fast idle cam follower on the highest step of the cam.
2. Use an outside vacuum source to seat the vacuum break diaphragm.
   - On delay feature models, cover the plug and the purge bleed hole with a 1 inch square of masking tape. Remove the tape after adjustment.
3. Push down on the choke valve (compress the plunger bucking spring and seat the plunger stem on models so equipped).
4. Gage between the lower edge of the choke valve and the inside of the air horn wall.
   - Hold the gage vertical.
5. Bend the link at point “A” to adjust.

FLOAT ADJUSTMENT (Figure 19)
Tool Required:
J-34817 Float Positioning Tool Kit
1. Remove the air horn and gasket.
2. Attach J-34817-2 to the float bowl using an air horn attaching screw.
3. Place J-34817-3 in the base with the contact pin resting on the edge of the float lever.
4. Measure the distance from the top of the casting to the top of the index at the toe of the float.
   - Use J-9789-90.
CARBURETORS 6C1-21

5. If more than ± 2/32" from specification, use J-34817-30 to bend the lever up or down. Remove J-34817-30 and measure, repeating until within specification.
6. Check float alignment.
7. Install the air horn and gasket.

METERING ROD ADJUSTMENT (Figure 20)
1. Remove the metering rod.
   • Hold the throttle valve wide open.
   • Push down on the metering rod against spring tension.
   • Slide the metering rod out of the slot in the holder.

2. Back out the idle stop solenoid.
   • Hold the throttle valve completely closed.
3. Hold the power piston down and swing the metering rod holder over the flat surface of the bowl casting next to the carburetor bore.
   • The gasket must be removed.
4. Gage between the end of the metering rod holder and the top of the casting.
   • Use the specified plug gage.
   • Gage should have a slide fit.
5. Bend at point “A” to adjust.

CARBURETOR MODELS M4ME AND M4MEF

DESCRIPTION
Models M4ME and M4MEF are four barrel, two stage carburetors with three major assemblies: the air horn, float bowl, and throttle body. They have six basic operating systems (figures 21 through 31).
- Float
- Idle
- Main Metering
- Power
- Pump
- Choke

The first “M” indicates this carburetor is of a Modified primary metering “open loop” design.
The “4M” is the model designation, indicating it is a four barrel carburetor. The remaining letters designate specific features.
- E — Has an electric choke.
- F — has an adjustable wide open throttle mixture control.

CARBURETOR IDENTIFICATION (Figure 21)
The carburetor identification number is stamped vertically on the float bowl near the secondary throttle lever. Refer to this number before servicing the carburetor. If replacing the float bowl assembly, follow instructions in the service package, and stamp or engrave the number on the new float bowl.

METERING SYSTEMS
A single float chamber supplies fuel to all carburetor bores. A float, float needle with pull clip, and a float needle seat, are used to control the level of fuel in the float chamber. A vacuum-operated power piston and metering rods control the air/fuel metering in the primary bores of the carburetor. Tapered metering rods are attached to the power valve piston assembly, and move in fixed metering jets, to provide the fuel flow for varying engine demands. A factory-set adjustable part throttle screw, used on all models, precisely positions the tapered portion of the metering rods in the jets. (On M4MEF models, the factory-set rich stop adjusting bushing precisely positions the enrichment portion of the metering rods in the jets.)

Air valves and tapered metering rods control the air/fuel mixture in the secondary bores during increased engine air flow at wide open throttle. On M4MEF models, the factory-set secondary well air bleed adjusting screw provides additional control of the air/fuel mixture during wide open throttle.

PUMP SYSTEMS
The pump system on all models uses a throttle actuated pump plunger, operating in the pump well. The pump provides extra fuel during quick throttle openings.

CHOKE SYSTEMS
A electrically heated choke coil provides the choke valve closing force for cold startup and for correct opening timing during warmup. A vacuum break assembly(s) controls initial choke valve opening at startup to provide sufficient air flow to the engine. An unloader tang on the throttle lever forces the choke valve open to purge a flooded engine when the accelerator is pressed to the floor. The fast idle cam, following choke valve movement, acts as a graduated throttle stop to provide increased idle speed during warmup.
**IDLE STOP SOLENOID (ISS)**

**Federal (Non-California) V8 Engines**

With Manual Transmission.

The electric Idle Stop Solenoid (ISS), on these applications, provides the desired engine idle speed, and prevents "dieseling" when the ignition is switched off.

**THROTTLE KICKER ASSEMBLY**

**California V8 Engines**

A vacuum operated Throttle Kicker assembly, found on these applications, retards throttle closing during deceleration, to improve emission control. Vacuum to the kicker is controller by the Throttle Return Control system, which is further described in DRIVEABILITY AND EMISSIONS – CARBURETED (SEC. 6E8).

ON-VEHICLE SERVICE (MODELS M4ME AND M4MEF)

FLOAT LEVEL - EXTERNAL CHECK

Tool Required:
J-34935-1 External float Level Gage
1. With the engine idling and the choke valve wide open, insert J-34935-1 in the vent slot or vent hole (figure 32).
   • Allow the gage to float freely.
   
   NOTICE: Do not press down on the gage. Flooding or float damage could result.

2. Observe the mark on the gage that lines up with the top of the casting. The setting should be within 1.588mm (2/32-inch) of the specified float level setting.
   • Incorrect fuel pressure will adversely affect the fuel level.

3. If not within specification, remove the air horn and adjust the float.

CHOKE CHECKING PROCEDURE - (ENGINE OFF)

1. Remove the air cleaner assembly.

2. Hold the throttle half way down.

3. Open and close the choke several times. Be sure all links are connected, and are not damaged. Choke valve, linkage, and fast idle cam must operate freely.
   • If the choke valve, linkage, or fast idle cam is sticking due to varnish, clean with choke cleaner X-20-A or equivalent.

   • Do not lubricate linkage, as lubricant will collect dust and cause sticking.

CHECKING ELECTRIC CHOKE - ON VEHICLE

1. Allow the choke stat to stabilize at about 21°C (70°F).
2. Open the throttle, to allow the choke valve to close.
3. Start the engine, determine the length of time for the choke valve to reach full open position:
   • If longer than five minutes, check the voltage at the choke stat connector, with the engine running:
     • If voltage is between 12 and 15 volts: Check for proper ground between choke cover and choke housing. If correct, replace choke cover assembly.

   • If the voltage is low or zero: Check all wires and connections. Refer to ENGINE ELECTRICAL (SEC. 6D).

VACUUM BREAK CHECKING PROCEDURE

Tool Required:
J-23738-A, Hand Operated Vacuum Pump
1. If the vacuum break has an air bleed hole, plug it during this checking procedure (figure 33).
2. Apply -51 kPa (15 in. Hg.) vacuum to the vacuum break.
   • Apply finger pressure to see if the plunger has moved through full travel. If not, replace the vacuum break.

   • Observe the vacuum gage. Vacuum should hold vacuum for at least twenty seconds. If not, replace the vacuum break.

3. Replace vacuum break hoses that are cracked, cut or hardened.

CHECKING IDLE STOP SOLENOID (ISS)

A non-functioning idle stop solenoid (ISS) (if equipped) could cause stalling or rough idle.

1. Turn the ignition on but do not start the engine.
2. Open the throttle momentarily to allow the solenoid plunger to extend.
6C1-38 CARBURETORS

3. Disconnect the wire at the solenoid. The plunger should drop back from the throttle lever.
4. Connect the solenoid wire. The plunger should move out and contact the throttle lever.
5. If the plunger does not move in and out as the wire is disconnected and connected, check voltage across the feed wire.
   • If the voltage is 12 to 15 volts, replace the solenoid.
   • If the voltage is low, locate the cause of the open circuit in the solenoid feed wire; repair as necessary.

CHECKING THROTTLE KICKER

Tool Required:
J-23738-A, Hand Held Vacuum Pump

1. Hold the throttle half way open to allow the plunger to extend fully.
2. Apply –68 (20” Hg) vacum to the throttle kicker (figure 34).
   • Apply finger pressure to the plunger to see if it has extended fully. If not, replace the throttle kicker.
   • Observe the vacuum gage. Vacuum should hold for at least twenty seconds. If not, replace the throttle kicker.
3. Release the vacuum to the throttle kicker.
   • If the plunger does not retract to its starting position, replace kicker.

FUEL FILTER REPLACEMENT

Remove or Disconnect (Figure 35)
1. Fuel line connection at the fuel inlet nut.
2. Fuel inlet nut.
3. Fuel inlet filter, gasket, and spring.

Install or Connect (Figure 35)
1. Fuel filter spring in float bowl.
2. New gasket on inlet nut.
3. Fuel inlet filter in inlet nut.

FUEL FILTER REPLACEMENT

The filter must include an inlet check valve to meet Motor Vehicle Safety Standards (M.V.S.S.) for roll-over.
• The check valve end of the filter must face the fuel line.

CARBURETOR MOUNTING TORQUE

After servicing, tighten mounting bolts, in a clockwise direction, to 16 N-m (144 in. lbs.). When retightening carburetor at recommended maintenance intervals, check in clockwise direction. If less than 7 N-m (60 in. lbs.), retighten to 11 N-m (96 in. lbs.); but if greater than 7 N-m (60 in. lbs.), do not retighten.

CARBURETOR REPLACEMENT

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in carburetor. To aid in diagnosing the cause, the carburetor should be removed carefully from the engine without draining fuel from the bowl. Contents of the fuel bowl then may be examined for foreign materials as the carburetor is disassembled.

Remove or Disconnect
1. Negative battery terminal.
2. Air cleaner assembly and gasket.
3. Electrical connectors from the choke and idle stop solenoid.
   • Make note of the vacuum hose routing.
5. Accelerator linkage.
6. Downshift cable (automatic transmission only).
7. Cruise control linkage (if equipped).
8. Fuel line connection at the fuel inlet nut.
10. Carburetor and flange insulator.
Clean

- Sealing surfaces on the intake manifold and carburetor.

**CAUTION:** Extinguish all open flames while filling and testing carburetor with gasoline to avoid personal injury.

Install or Connect

1. Carburetor with new flange gasket.
   - It is good shop practice to fill the carburetor float bowl before installing the carburetor. This reduces the strain on starting motor and battery and reduces the possibility of backfiring while attempting to start the engine. Operate the throttle several times and check the discharge from pump jets before installing the carburetor.

2. Carburetor attaching bolts.
   - Tighten to 16 N·m (144 in. lbs.)—Tighten in a criss-cross pattern.

Tighten

- Bolts to 16 N·m (144 in. lbs.)
  - Tighten in a criss-cross pattern.

3. Fuel line to the fuel inlet nut.
4. Cruise control cable (if equipped).
5. Downshift cable (automatic transmission only).
6. Accelerator linkage.
7. Vacuum hoses.
   - Refer to the Emission Control Information Label for vacuum hose routing information.
8. Electrical connectors to the choke and idle stop solenoid.
9. Air cleaner assembly with gasket.
10. Negative battery terminal.

Adjust

- Idle mixture and idle speeds.

**IDLE MIXTURE ADJUSTMENT**

(HEAVY DUTY EMISSION VEHICLES ONLY)

In case of a major carburetor overhaul, throttle body replacement, or high idle CO (when indicated by an emissions inspection), the idle mixture may be adjusted. Adjusting the mixture by other than the following method may violate Federal and/or state laws (figures 36 through 38).

**Tool Required:**
J-29030-B Idle Mixture Needle Socket.

1. Set parking brake and block drive wheels.
2. Remove the carburetor from the engine.
3. Drain fuel from the carburetor into a container. Dispose of the fuel in an approved container.
4. Remove idle mixture needle plugs (figure 36):
   - Invert the carburetor and support it to avoid damaging external components.

   **Figure 36—Removing Idle Mixture Needle Plugs**

   - Make two parallel hacksaw cuts in the throttle body, between the locator points near one idle mixture needle plug. The distance between the cuts depends on the size of the punch to be used.
     - Cut down to the plug, but not more than 1/8-inch beyond the locator point.
   - Place a flat punch at a point near the ends of the saw marks. Hold the punch at a 45 degree angle and drive it into the throttle body until the casting breaks away, exposing the steel plug.
   - Use a center punch to break the plug apart, uncover idle mixture needle.
     - Remove all loose pieces of plug.
   - Repeat the previous steps for the other needle plug.
5. Use J-29030-B to lightly seat the idle mixture needles, then back out three turns.
6. Reinstall carburetor on the engine.
7. Place transmission in “P” (PARK) (automatic transmission) or “N” (NEUTRAL) (manual transmission).
8. Start the engine and bring it to a normal operating temperature, choke valve open, and air conditioning off.
9. Connect a known accurate tachometer to the engine.
10. Check ignition timing, and adjust if necessary, by following the procedure described on the Emission Control Information Label.
11. Use J-29030-B to turn the mixture needles equally (1/8 turn at a time), in or out, to obtain the highest RPM (best idle).
12. Adjust the idle speed screw (throttle stop) to obtain the base idle speed specified on the Emission Control Information label.
13. Again try to readjust mixture needles to obtain the highest idle RPM.

The adjustment is correct when the highest RPM (best idle) is reaches with the minimum number of mixture needle turns from the seated position.
14. If necessary, readjust the idle speed screw (throttle stop) to obtain the specified base idle speed.

15. Check, (and if necessary, adjust), idle speed solenoid activated speed, and fast idle speed. Refer to figures 38 and 39 and the Emission Control Information label.

16. Check the throttle kicker (TRC RPM), and adjust if necessary. Refer to the "Fuel and Emissions Service Manual" and to the Emission Control Information label.

17. Turn off the engine, and remove the block from the drive wheels.

**IDLE SPEED ADJUSTMENT**

Refer to figures 37 through 39 and the Emission Control Information label to adjust idle speed, idle speed solenoid activated speed, and fast idle speed.

**THROTTLE KICKER ADJUSTMENT**

Refer to the "Fuel and Emissions Service Manual" to adjust the throttle kicker.

**FLOAT ADJUSTMENT**

Tools Required:
- J-9789-90, Float Level "T" Scale
- J-34817, Float Positioning Tool Kit

1. Remove the air horn, gasket, power piston and metering rod assembly, and the float bowl insert (figure 40).
2. Attach J-34817-1 to the float bowl.
3. Place J-34817-3 in J-34817-1 with the contact pin resting on the outer edge of the float lever.
4. Measure the distance from the top of the casting to the top of the float at a point 3/16-inch from the large end of the float.
   - Use J-9789-90.
CARBURETORS 6C1-41

A. Solenoid Screw
B. Idle Speed Screw
C. Electrical Connection

Make sure Pump Link is in specified hole.

With Fast Idle Cam off Cam Follower Lever, turn Throttle Stop Screw out so it does not touch Throttle Lever.

Measure distance from top of Choke Valve wall to top of Pump Stem.

Adjust, if necessary, by supporting Pump Lever at and bending at notch.

5. If more than ± 2/32-inch from specification, use J-34817-25 to bend the lever up or down.
   - Remove J-34817-25 and measure, repeating until within specification.

6. Check the float alignment.

7. Reassemble the carburetor.

PUMP ADJUSTMENT

Tool Required:
J-9789-90, Float Level "T" Scale

1. The pump link (410) must be in the specified hole (figure 41).
2. With the fast idle cam off the cam follower lever, turn the throttle stop screw (380) out so it does not touch the throttle lever.
3. Measure the distance from the top of the choke valve wall to the top of the pump stem.
4. Adjust, if necessary, by supporting the pump lever (41) with a screwdriver and bending it at the notch.

AIR VALVE RETURN SPRING ADJUSTMENT

1. Loosen the setscrew (figure 42).
2. a. Turn spring flucrum pin counterclockwise until the air valves open.
   b. Turn the pin clockwise until the air valves close, then the additional turns specified.
3. Tighten the setscrew.
4. Apply lithium grease to the spring contact area.
1. Loosen set screw.

2a. Turn Spring Fulcrum Pin until Air Valves open.

2b. Turn pin until Air Valves close, then additional turns specified.

3. Tighten set screw.

4. Apply Lithium grease to spring contact area.

---

**CHOKE STAT LEVER ADJUSTMENT**

Tool Required:
- J-9789-111, Linkage Bending Tool

1. Drill out and remove the choke cover attaching rivets. Remove choke cover and stat assembly (figure 43).
2. Place fast idle cam on high step against the cam follower lever.
3. Push up on the choke stat lever to close the choke valve.
4. Check the stat lever for correct orientation by inserting a 0.120-inch plug gage hole in the choke housing.
   - The gage should fit in the hole and touch the edge of the lever.
5. Adjust, if necessary, by bending the choke link with J-9789-111.

---

**CHOKE LINK AND FAST IDLE CAM ADJUSTMENT**

Tool Required:
- J-26701-A, Choke Valve Angle Gage
1. Attach a rubber band to the vacuum break lever of the intermediate choke shaft (figures 44 and 45).
2. Open the throttle to allow the choke valve to close.
3. Set up J-26701-A and set angle to specifications.
   - Rotate the degree scale until zero is opposite the pointer.

---

**PRIMARY SIDE VACUUM BREAK ADJUSTMENT**

Tools Required:
- J-26701-A, Choke Valve Angle Gage
- J-23738-A, Hand Operated Vacuum Pump
1. Attach rubber band to the vacuum break lever of the intermediate choke shaft (figures 44, 46 47).
2. Open the throttle to allow the choke valve to close.
3. Set up J-26701 and set angle to specifications.
   - Rotate the degree scale until zero is opposite the pointer.
   - Center the leveling bubble.
   - Rotate the scale to the specified angle.
     - Refer to “Specifications.”
4. Place the fast idle cam on the second step against the cam follower lever, with the lever contacting the rise of the high step. If the lever does not contact the cam, turn the fast idle adjusting screw in additional turn(s).
   - Final Fast Idle Speed Adjustment must be performed according to the Emission Control Information label.
5. Adjust, if bubble is not recentered, by bending the fast idle cam kick lever with pliers.
1. If riveted, drill out and remove rivets. Remove Choke Cover and Stat Assembly.
2. Place Fast Idle Cam on high step against Cam Follower Lever.
3. Push up on Choke Stat Lever to close Choke Valve.
4. Check Stat Lever for correct orientation by inserting .120" plug gage in hole. Gage should fit in hole and touch edge of lever.
5. Adjust, if necessary, by bending Choke Link.

Figure 43—Choke Stat Lever Adjustment

1. Attach Angle Gage Magnet to closed Choke Valve.
2. Rotate degree scale until zero is opposite pointer.
3. Center the leveling bubble.
4. Rotate scale to specified angle.
5. Open Choke Valve as described.
6. Adjust linkage if bubble is not recentered.

Figure 44—Choke Valve Angle Gage
4. • Plug vacuum break bleed holes, if applicable.
• Apply −51 kPa (15-inches Hg) vacuum to seat the vacuum break plunger.
• Seat bucking spring, if applicable.
• If necessary, bend the air valve link to permit full plunger travel, then reapply vacuum to fully retract plunger.
5. Adjust, if bubble is not recentered, by turning the vacuum break adjusting screw.

SECONDARY SIDE VACUUM BREAK ADJUSTMENT

Tools Required:
J-26701-A, Choke Valve Angle Gage
J-23738-A, Hand Operated Vacuum Pump
J-9789-111, Linkage Bending Tool

1. Attach a rubber band to the vacuum break lever of the intermediate choke shaft.
2. Open the throttle to allow the choke valve to close.
3. Set up J-26701 and set angle to specification (figure 44).
   • Rotate the degree scale until zero is opposite the pointer.
   • Center the leveling bubble.
   • Rotate the scale to the specified angle.
   — Refer to "Specifications."

Figure 45—Choke Link - Fast Idle Cam Adjustment

Figure 46—Vacuum Break Adjustment Information
4. • Plug vacuum break bleed holes, if applicable.
  • Apply –51 kPa (15-inches Hg) vacuum to seat the vacuum break plunger.
  • Compress the plunger bucking spring, if applicable.
  • If necessary, bend the air valve link to permit full plunger travel, then reapply vacuum to fully retract the plunger (figures 46 and 47).

5. Adjust, if bubble is not recentered, by either:
  • Supporting the link where shown, and bending it with J-9789-111. Or
  • turning screw with a 1/8-inch hex wrench.

**AIR VALVE LINK ADJUSTMENT**

Tools Required:
- J-23738-A, Hand Operated Vacuum Pump
- J-9789-111, Linkage Bending Tool
1. Plug vacuum break bleed holes, if applicable. With the air valves closed, apply –51 kPa (15-inches Hg) vacuum to seat the vacuum break plunger (figure 46 and 49).

2. Gage the clearance between the air valve link and the end of the slot in the air valve lever. Clearance should be 0.025-inch.

3. Adjust, if necessary, by bending link with J-9789-111.

**UNLOADER ADJUSTMENT**

Tools Required:
- J-26701-A, Choke Valve Angle Gage
- J-9789-111, Linkage Bending Tool
1. Attach a rubber band to the vacuum break lever of the intermediate choke shaft (figures 44 and 50).
2. Open the throttle to allow the choke valve to close.
3. Set up J-26701-A and set angle to specifications.
   • Rotate the degree scale until zero is opposite the pointer.
   • Center the leveling bubble.
   • Rotate the scale to the specified angle.
     — Refer to "Specifications."
4. Hold the secondary lockout lever away from the pin.
5. Hold the throttle lever in wide open position.
6. Adjust, if bubble is not recentered, by bending fast idle lever with J-9789-111.
SECONDARY THROTTLE LOCKOUT ADJUSTMENT

1. Place the fast idle cam on the high step against the cam follower lever (figure 51).
2. Hold the throttle lever closed.
3. Gage the clearance between the lockout lever and pin. It must be 0.015-inch ± 0.005-inch.
4. Adjust, if necessary, by bending pin.
5. Push down on tail of fast idle cam to move lockout lever away from pin.
6. Rotate the throttle lever to bring the lockout pin to the position of minimum clearance with the lockout lever.
7. Gage the clearance between the lockout lever and pin. The minimum must be 0.015-inch.
8. Adjust, if necessary, by filing the end of the pin.

 Attach rubber band to Vacuum Break Lever of Intermediate Choke Shaft.

 Open Throttle to allow Choke Valve to close.

 Set up Angle Gage and set to specification.

 On Quadrajet, hold Secondary Throttle Lockout Lever A away from pin B.

 Hold Throttle Lever in wide open position.

 Adjust, if bubble is not recentered, by bending Fast Idle Lever.

SECTION 6C2
DIESEL FUEL INJECTION

DESCRIPTION

The 6.2 L diesel engine fuel system is composed of:
- Fuel tank
- Mechanical fuel pump
- Fuel filter with water sensor and heater
- Fuel filter restriction switch
- Injection distributor pump
- High pressure lines
- Fuel injection nozzles

Fuel is drawn from the fuel tank by the mechanical pump which is located on the right side of the engine. The pump is driven by an eccentric lobe on the camshaft through a push rod. Fuel is then pumped through the filter / water separator. The filter / water separator is located on the engine side of the cowl (R-V models) or under the rear of the air cleaner (G-P models). The fuel is then transferred to the injection pump.

The injection pump is mounted on top of the engine under the intake manifold. The pump is driven by the camshaft through two gears, one attached to the front of the camshaft and the other attached to the end of the injection pump shaft. These gears are the same size and have the same number of teeth; therefore, the injection pump shaft turns at the same speed as the camshaft. The pump turns in the opposite direction of the camshaft and crankshaft.

The injection pump is a high pressure rotary type pump that meters, pressurizes, and distributes fuel to the eight injector nozzles. The eight high pressure lines are all the same length although their shape may be different. This prevents timing differences between cylinders. Injection lines should not be bent to ease removal.

FUEL FILTER REPLACEMENT

The fuel filter on R-V models is located on the engine side of the cowl. The fuel filter on G-P models is mounted on the rear of the inlet manifold under the air cleaner. It is accessible by removing the engine cover.

**Remove or Disconnect (Figures 1 and 2)**

1. The fuel tank cap to release pressure or vacuum in the tank.
2. The bail wires (1) using a screwdriver.
   - Drain fuel from the filter by opening both the air bleed and water drain valves and allowing fuel to drain into an appropriate container.
3. Filter.

**Clean**
- Any dirt from the fuel port sealing surface of the filter adapter and the new filter.

**Install or Connect (Figures 1 and 2)**

1. New filter.
2. The bail wires.
   - Close the water drain valve and open the air bleed.
3. A 3.18 mm (1/8 inch) inside diameter hose to the air bleed port and the other end into a suitable container.
   - Disconnect the fuel injection pump shut off solenoid wire.

**NOTICE:** If the engine is to be cranked, or starting attempted with the air cleaner removed, care must be taken to prevent material from being pulled into the air inlet manifold which could result in engine damage.

- Crank the engine for 10-15 seconds and then wait one minute for the starter motor to cool. Repeat until clear fuel is observed coming from the air bleed.
**IDLE SPEED ADJUSTMENT**

**CURB IDLE SPEED (Figure 3)**

Tool Required: J-26925, Tachometer

1. Set the parking brake and block the drive wheels.
2. Engine must be at normal operating temperature with the air cleaner on and all accessories turned off.
3. Install J-26925 or equivalent per manufacturers instructions.
4. Adjust the low idle speed screw (2) on the fuel injection pump to obtain the curb idle speed shown on the Emission Control Information label.

**FAST IDLE SPEED (Figure 3)**

Tool Required: J-26925, Tachometer

1. Set the parking brake and block the drive wheels.
2. Engine must be at normal operating temperature with the air cleaner on and all accessories turned off.
3. Install J-26925 or equivalent per manufacturers instructions.
4. Remove the connector from the fast idle solenoid.
5. Connect an insulated jumper wire from the positive battery terminal to the solenoid terminal. This will energize the solenoid.
6. Open the throttle momentarily to energize and fully extend the fast idle solenoid plunger.
7. Adjust the extended plunger (3) by turning the hex head to obtain the fast idle speed shown on the Emission Control Information label.
8. Remove the jumper wire and install the connector to the fast idle solenoid.

**THROTTLE POSITION SWITCH ADJUSTMENT (LH6 ENGINE WITH 700 R4 TRANSMISSION)**

Tool Required: J-33043-A, Gage Block

1. Disconnect the throttle position switch (TPS) connector.
2. Loosen the mounting screws that hold the TPS.
3. Connect an ohmmeter or test light to the IGN (pink) and EGR (yellow) terminals of the TPS (figure 4).
4. Insert the proper "switch closed" gage block between the gage boss on the injection pump and the wide open stop screw on the throttle shaft (figure 5).
   - Refer to the Emission Control Information label for correct gage block.
5. Rotate the throttle lever and hold the wide open stop screw against the gage block.
6. Rotate the TPS until there is continuity between the terminals.
7. Hold the TPS and tighten the mounting screws to 6 N-m (53 in. lbs.).
8. Return the throttle lever to the idle position and remove the gage block.
9. Insert the proper "switch open" gage block and rotate the throttle lever against the block. There should be no continuity. If there is continuity, repeat steps 1 through 9.
   - Refer to the Emission Control Information label for correct gage block size.
10. Remove the gage block and ohmmeter.
11. Connect the TPS connector.
VACUUM REGULATOR VALVE ADJUSTMENT (LL4 ENGINE WITH AUTOMATIC TRANSMISSION)

Tool Required:
J-33043-A, Gage Block
J-36142, Switch Gage Tool

1. Loosen the vacuum regulator valve (VRV) so it is free to rotate on the pump.
2. Attach a vacuum source of 67 ± 5 kPa (20 inches Hg ± 1.5 inch Hg) to the bottom vacuum port of the VRV.
3. Attach a vacuum gage to the top vacuum port (figure 6).
4. Insert the proper gage block between the gage boss on the injection pump and the wide open stop screw on the throttle lever (switch on position) (figure 5).
   • Refer to the Emission Control Information label for correct gage block size.
5. Rotate the throttle shaft and hold it against the gage block.

NOTICE: Valve must be set while rotating the valve body clockwise only.

6. Slowly rotate the vacuum regulator valve body clockwise (facing the valve) until the vacuum gage reads 38.8 ± 2 kPa (11.5 ± 0.6 inches Hg). Hold the valve body at this position and tighten the mounting screws to 6 N·m (54 in. lbs.).
7. Check by allowing the throttle shaft to return to the idle stop position. Then rotate the throttle shaft back against the gage block and read the vacuum gage. The gage should read 38.8 ± 2 kPa (11.5 ± 0.6 inches Hg). If vacuum is outside of limits, reset the valve.
8. With the valve vacuum set, confirm the detent switch point by reading the resistance between the ignition terminal (pink with black stripe) and the detent terminal (orange).
9. Insert J-36142 between the wide open stop pin and the wide open stop screw on the throttle lever.
10. Rotate the throttle lever against the tool. There should be no continuity (infinite resistance).

11. Release the throttle lever and remove the switch gage tool.
12. Rotate the throttle lever to wide open throttle (the lever stop screw touching the pump stop pin).
13. Check the switch for continuity. The switch must have continuity (1 to 0 ohms) before the throttle reaches the wide open throttle position. If the switch does not meet these specifications, reset the assembly by returning to step 1 and repeating the entire procedure.

HOUSING PRESSURE COLD ADVANCE

The Housing Pressure Cold Advance feature advances the injection timing about four degrees during cold operation. This provides better cold starts, improved cold idle, and emission control.

The circuit is actuated by a coolant temperature switch on the rear of the right cylinder head. The switch is calibrated to open the circuit at 35°C (95°F). Below the switching point, timing is advanced by decreasing housing pressure from 68.95 kPa (10 psi) to zero. Above the switching point, the housing pressure is returned to 68.95 kPa (10 psi). The fast idle solenoid is energized by the same switch.

INJECTION LINE REPLACEMENT

Clean
• All line fittings that will be loosened or removed.

Remove or Disconnect (Figures 7 and 8)
Tool Required: J-29664-1, Protective Covers
1. Battery negative cables.
2. Engine cover (G-Van only).
3. Air cleaner at the valve cover.
4. Crankcase ventilator bracket.
5. Intake manifold bolts.
It may be necessary to loosen the vacuum pump hold down clamp and rotate the pump to gain access to all intake manifold bolts.

6. Injection line clips.
7. Intake manifold.
   • Install J-29644-1 to the intake ports.
8. Injection line clips at the loom brackets.
9. Injection lines at the nozzles.
   • Cap the lines and nozzles immediately.
   • Do not bend injection lines.
10. Injection lines at the pump.
    • Cap the lines and the pump fittings immediately.
    • Tag the lines for installation.

Install or Connect (Figures 7 and 8)
1. Injection lines at the pump.
   • Uncap the lines and pump fittings.
   • Refer to the tags for correct installation.
   • Raise the vehicle (left bank of G-Van only).
2. Injection lines at the nozzles.
   • Uncap the lines and nozzles.

Tighten
• Fittings to 25 N·m (20 ft. lbs.).
3. Injection line clips at the loom brackets.
4. Intake manifold.
   • Remove J-29664-1.
5. Injection line clips.
6. Intake manifold bolts.

Tighten
• Bolts to 40 N·m (30 ft. lbs.).
7. Crankcase ventilator bracket.
8. Air cleaner.
9. Engine cover (G-Van only).
10. Battery negative cables.

INJECTION PUMP REPLACEMENT

R-V TRUCK

Remove or Disconnect
Tool Required: J29664-1, Protective Covers
1. Battery negative cable.
2. Intake manifold.
   • Refer to 6.2 LITER DIESEL (SEC. 6A6).
3. Injection lines.
4. Accelerator cable at the injection pump (figure 9).
5. Detent cable (if equipped).
6. Fuel return line at the top of the injection pump.
7. Fuel inlet line from the injection pump.
8. All necessary wires and hoses from the injection pump.
9. Air conditioning hose retainer bracket (if equipped).
10. Oil fill tube (includes CDR valve vent hose).
   • Scribe or paint a mark on the front cover and the injection pump flange.
   • Rotate the engine to gain access to the bolts that hold the driven gear to the injection pump.

**Tighten**
- Fitting to 25 N·m (20 ft. lbs.).
9. Fuel return line to the top of the injection pump.
10. Detent cable (if equipped).
11. All necessary wires and hoses.
13. Injection lines.
  - Refer to 6.2 LITER DIESEL (SEC. 6A6).
15. Battery negative cable.

**G-VAN**

**Remove or Disconnect**
Tool Required: J-29664-1, Protective Covers
1. Battery negative cable.
2. Engine cover.
3. Intake manifold.
  - Refer to 6.2 LITER DIESEL (SEC. 6A6).
4. Air cleaner inlet hose.
  - Rotate the snorkel up.
5. Hood latch.
6. Hood latch cable and move it aside.
7. Windshield washer bottle.

8. Detent cable (if equipped).
9. Electrical connections at the injection pump.
10. The oil pan dipstick tube at the left cylinder head.
11. Injection lines to the brackets.
12. Wire looms to the injection lines.
13. Fuel filter and bracket including the line to the injection pump.
14. The oil fill tube grommet.
15. The oil fill tube.
16. The oil fill tube nuts.
17. Rubber hose to the oil fill tube.
18. Upper fan shroud.
19. Fan shroud bolts.
20. Windshield washer bottle.
22. Hood latch.
23. Air cleaner inlet hose.
24. Intake manifold.
- Refer to 6.2 LITER DIESEL (SEC. 6A6).
25. Engine cover.

26. Battery negative cable.

INJECTION TIMING ADJUSTMENT

For the engine to be properly timed, the marks on the top of the engine front cover must be aligned with the marks on the injection pump flange (figure 13). The engine must be off when the timing is reset. On Federal models, align the scribe marks. On California models, align the half circles.

Adjust
1. Injection timing.
   - Loosen the three pump retaining nuts.
   - Align the mark on the injection pump with the mark on the front cover.

Tighten
- Pump retaining nuts to 40 N·m (30 ft. lbs.).
2. Throttle rod.

MARKING TDC ON THE FRONT HOUSING

Tool Required: J-33042, Timing Fixture
1. Set the engine so that number 1 cylinder is at TDC (firing).
2. Install J-33042 in the injection pump location.
   - Do not use the gasket.
— Align the timing mark on the injection pump flange with the mark on the front cover.

5. Remaining pump gear attaching bolts.
   - Rotate the engine to gain access to the bolts.

   **Tighten**
   - Bolts to 25 N·m (20 ft. lbs.).

3. The slot in the injection pump gear should be in the vertical 6 o'clock position (figure 14). If not, remove J-33042 and rotate the engine crankshaft 360 degrees. The timing marks on the gears will be aligned.

4. Fasten J-33042 to the gear and tighten (figure 15).

5. Install one 10 mm nut to the upper housing stud to hold the tool flange.
   - The nut should be finger tight.

6. Tighten the large bolt (18 mm head) clockwise (looking at the front of the engine) to 48 N·m (35 ft. lbs.).

7. Tighten the 10 mm nut.

8. Check that the crankshaft has not rotated and that the tools did not bind.

9. Strike the scriber with a mallet to mark TDC on the front housing.

**Install or Connect**

1. Gasket.
2. Injection pump.
3. Nuts (finger tight).
4. One 8 mm bolt to attach the gear to the pump hub.

**Tighten**

- Bolt to 25 N·m (20 ft. lbs.).
- Injection pump nuts to 40 N·m (30 ft. lbs.).
INJECTION NOZZLES

Nozzles used in G models are shorter than nozzles used on R-V and P models. Attempts to use the incorrect nozzle will damage the cylinder heads. When replacing nozzles, reference should be made to the part number which is stamped on the side of the nozzle (figure 16).

INJECTION NOZZLE REPLACEMENT

**Remove or Disconnect (Figure 17)**

Tool Required: J-29873, Nozzle Socket

1. Negative battery cable.
2. Fuel line clip.
3. Fuel return hose.
4. Fuel injection line.
   - Cap the nozzle and lines.

**NOTICE:** When removing an injection nozzle, use J-29873. Remove the nozzle using the 30 mm hex portion (figure 16). Failure to do so will result in damage to the injection nozzle.

5. Injection nozzle using J-29873.

**Install or Connect (Figure 17)**

Tool Required: J-29873, Nozzle Socket

**NOTICE:** When installing an injection nozzle, use J-29873. Install the nozzle using the 30 mm hex portion (figure 16). Failure to do so will result in damage to the injection nozzle.

1. Injection nozzle using J-29873.

**Tighten**

- Nozzle to 70 N·m (50 ft. lbs.).
2. Fuel injection line.

**Tighten**

- Nut to 25 N·m (20 ft. lbs.).
3. Fuel return hose.
4. Fuel line clip.
5. Negative battery cable.

INJECTION NOZZLE TESTS

Nozzle testing is comprised of the following checks:

- Nozzle opening pressure
- Leakage
- Chatter
- Spray pattern

Each test should be considered independent of the others (for example, when checking opening pressure, do not check for leakage).

If all of the above tests are satisfied, the nozzle holder assembly can be re-used. If any one of the tests is not satisfied, the complete nozzle holder assembly must be replaced. The nozzle holder will then be checked and repaired at a centralized location.

- Test Lines - 6 x 2 x 400 mm (1.5 mm bore).
- Test Fluid - per ISO 4113 (Example: Shell V 1399, Viscosity 1487°C or equivalent).
- Kinetic Viscosity at 40° - per ISO 3104: 2.45 - 2.75 mm²/second.
- Test oil temperature during test: 20 - 25°C (68°F - 77°F).
• Refer to the equipment manufacturers instructions for exact test procedures.

1. Connect the nozzle holder assembly to the test line.
2. Place clear plastic tubes on overflow connections to prevent leakoff from being confused with actual leak.
3. Close the shutoff valve to the pressure gage.

**CAUTION:** When testing nozzles, do not place your hands or arms near the tip of the nozzle. The high pressure atomized fuel spray from a nozzle has sufficient penetrating power to puncture flesh and destroy tissue and may result in blood poisoning. The nozzle tip should always be enclosed in a receptacle, preferably transparent, to contain the spray.

4. Fill and flush the nozzle holder assembly with test oil by activating the lever briskly and repeatedly. This will apply test oil to all functionally important areas of the nozzle and purge it of air.

**OPENING PRESSURE TEST**
1. Open the shutoff valve at the pressure gage one-quarter turn.

**CAUTION:** When testing nozzles, do not place your hands or arms near the top of the nozzle. The high pressure atomized fuel spray from a nozzle has sufficient penetrating power to puncture flesh and destroy tissue and may result in blood poisoning. The nozzle tip should always be enclosed in a receptacle preferably transparent, to contain the spray.

2. Depress the tester lever slowly. Note at what pressure the needle of the pressure gage stopped. The maximum observed pressure is the opening pressure. *Some nozzles may pop while other nozzles may drip down (this is not leakage).*
3. The opening pressure should not fall below the lower limit of 105 bar (1500 psi) on used nozzles.
4. Replace nozzles which fall below the lower limit.

**LEAKAGE TEST**
1. Further open the shutoff valve at the pressure gage \( \frac{1}{2} \) to 1 \( \frac{1}{2} \) turns.
2. Blow-dry the nozzle tip.

**CAUTION:** When testing nozzles, do not place your hands or arms near the top of the nozzle. The high pressure atomized fuel spray from a nozzle has sufficient penetrating power to puncture flesh and destroy tissue and may result in blood poisoning. The nozzle tip should always be enclosed in a receptacle preferably transparent, to contain the spray.

3. Depress the lever of the manual test stand slowly until the gage reads a pressure of 95 bar (1400 psi). Observe the nozzle tip. A drop may form on the end of the nozzle but should not drop off within a period of 10 seconds.
4. Replace the nozzle assembly if a drop falls during the 10 seconds.

**CHATTER TEST**
When testing for chatter, it should be noted that the sound (chatter) for new and used nozzles may vary. This is due to carbonized fuel deposits on the pintle and nozzle tip of used nozzles. With some used nozzles, chatter is difficult to detect during slow actuation of the hand lever.

Some nozzles may chatter louder than others. As long as there is chatter, the nozzle is acceptable.

1. Close the shutoff lever at the pressure gage.

**CAUTION:** When testing nozzles, do not place your hands or arms near the top of the nozzle. The high pressure atomized fuel spray from a nozzle has sufficient penetrating power to puncture flesh and destroy tissue and may result in blood poisoning. The nozzle tip should always be enclosed in a receptacle preferably transparent, to contain the spray.

2. Depress the lever of the test stand slowly and note whether chatter noise can be heard.
3. If no chatter is heard, move the lever faster until it chatters. At fast lever movement, the nozzle may make a “hissing” or “squealing” sound rather than the normal chatter. This is acceptable.
4. These sounds indicate that the nozzle needle moves freely and that the nozzle seat, guide, and pintle are OK.
5. Replace nozzles that do not chatter.

**SPRAY PATTERN**
This nozzle features a longer nozzle overlap, greater pintle to body clearance, greater needle to body clearance, and an internal wave washer between the nozzle nut and the nozzle. These features make objective spray pattern testing difficult.

A pop tester will not deliver fuel fast enough for proper spray pattern analysis. Based on this, this type of nozzle should not be rejected for spray pattern.
INJECTION PUMP ON-VEHICLE SERVICE

Refer to figure 18 for injection pump components location.

PUMP COVER SEAL AND/OR GUIDE STUD SEAL REPLACEMENT

Remove or Disconnect

Tool Required: J-29664, Manifold Cover Set
1. Negative battery cables.
2. Air cleaner and intake manifold.
   - Install J-29664 in the cylinder heads.
3. Injection pump fuel solenoid wire.
4. Housing pressure cold advance wire.
5. Fuel return line.
6. Top attaching bolt and loosen the lower attaching bolt on the fast idle solenoid. Move the solenoid aside.

Clean

- Injection pump cover.
- Upper portion of the pump.
- The guide stud area.
- Place several rags in the engine valley to catch fuel.

NOTICE: Extreme care must be used to keep foreign material out of the pump when the cover is off. If any objects are dropped into the pump, they must be removed before the engine is started or injection pump and engine damage could occur.

7. Injection pump cover screws.
8. Injection pump cover.
9. The guide stud and washer.
   - Note location of parts prior to removal.
Figure 19—Metering Valve Spring Position

- Observe the position of the metering valve spring over the top of the guide stud (figure 19). This position must be exactly duplicated during assembly.

10. Pump cover seal from the pump cover.

Install or Connect

1. The guide stud with a new washer.
   • Make sure that the upper extension of the metering valve spring rides on top of the guide studs.

Tighten

- The guide stud to 9.5 N·m (85 in. lbs.).
  — Overtightening the guide stud may strip the aluminum threads in the housing.

2. New pump cover seal in the pump cover.

3. The pump cover.
   • The screws should not be in the pump cover.
   • Position the cover about 6 mm (¼-inch) forward (toward the shaft end) and about 3 mm (¼-inch) above the pump (figure 20).
   • Move the cover rearward and downward into position, being careful not to cut the seal.
     — Hold throttle in the idle position.

4. The cover screws.
   • Be careful not to drop or lose the flat washer and spring washer on each screw.
   • The flat washer must be against the pump cover.

Tighten

- Screws to 3.7 N·m (33 in. lbs.).

5. Battery negative cables.

Inspect

- Turn the ignition switch to the run position and touch the pink wire to the solenoid connector. A clicking noise should be heard as the wire is connected and disconnected. If this clicking is not heard, the linkage may be jammed in the wide open throttle position and the engine MUST NOT BE STARTED. If clicking is not heard, remove the cover and ground the solenoid lead (opposite the hot lead) and connect the pink wire. With the ignition switch in the run position, the solenoid in the cover should move the linkage. If not, the solenoid must be replaced. Minimum voltage across the terminals must be 12.0. Install the cover and repeat the inspection.

6. Fuel return line, throttle cable, and the return springs.

7. Fast idle solenoid.

8. Housing pressure cold advance wire.

   • Start the engine and check for leaks.
   • Idle roughness may be observed due to air in the pump. Engine idling will allow the air to purge.
     — It may be necessary to shut the engine down for several minutes to allow air bubbles to rise to the top of the pump.

10. Intake manifold and air cleaner.
   • Remover J-29664.

MINIMUM-MAXIMUM
GOVERNOR REPLACEMENT

Remove or Disconnect (Figure 21)

Tool Required:
J-29664, Manifold Cover Set

1. Negative battery cables.

2. Air cleaner and intake manifold.
   • Install J-29664 in the cylinder heads.

3. Injection pump fuel solenoid wire.

4. Housing pressure cold advance wire.

5. Fuel Return line.

6. Fast idle solenoid top attaching bolt.
   • Loosen the lower bolt, and move the solenoid aside.

7. Injection pump cover screws.

Clean

- Injection pump cover.
- Upper portion of the pump.
- The guide stud area.
Figure 21—Injection Pump Cover Removed

- Place several rags in the engine valley to catch the fuel.

NOTICE: Extreme care must be used to keep foreign material out of the pump when the cover is off. If any objects are dropped into the pump, they must be removed before the engine is started or injection pump and engine damage could occur.

8. Injection pump cover.
9. The guide stud and washer.
   - Note the location of parts prior to removal.
   - Observe the position of the metering valve spring over the top of the guide stud (figure 19). This position must be exactly duplicated during assembly.
10. Pump cover seal from the pump cover.
   - Rotate the throttle shaft and the governor assembly until the governor clears the housing.
   - Governor assembly from the throttle shaft.

Install or Connect (Figure 21)
1. Minimum-Maximum governor assembly.
   - Rotate throttle shaft to full throttle.
   - Place the slotted portion of the governor assembly onto the throttle shaft slot.
   - Rotate the throttle shaft with governor assembly into the housing.
2. The guide stud with a new washer.

- Make sure that the upper extension of the metering valve spring rides on top of the guide stud.

Tighten
- The guide stud to 9.5 N·m (85 in. lbs.).
  — Overtightening the guide stud may strip the aluminum threads in the housing.
3. New pump cover seal in the pump cover.
4. The pump cover.
   - The screws should not be in the pump cover.
   - Position the cover about 6 mm ('4-inch) forward (toward the shaft end) and about 3 mm ('6-inch) above the pump (figure 20).
   - Move the cover rearward and downward into position, being careful not to cut the seal.
  — Hold throttle in the idle position.
5. The cover screws.
   - Be careful not to drop or lose the flat washer and spring washer on each screw.
   - The flat washer must be against the pump cover.

Tighten
- Screws to 3.7 N·m (33 in. lbs.).
6. Battery negative cables.

Inspect
- Turn the ignition switch to the run position and touch the pink wire to the solenoid connector. A clicking noise should be heard as the wire is connected and disconnected. Install the cover and repeat the inspection.
7. Fuel return line, throttle cable, and the return springs.
9. Housing pressure cold advance wire.
10. Injection pump fuel solenoid wire.

- Start the engine and check for leaks.
- Idle roughness may be observed due to air in the pump. Engine idling will allow the air to purge.
  — It may be necessary to shut the engine down for several minutes to allow air bubbles to rise to the top of the pump.
11. Intake manifold and air cleaner.
   - Remove J-29664.

THROTTLE SHAFT SEAL REPLACEMENT

Remove or Disconnect
Tools Required:
J-29601, Injection Pump Timing Adapter
J-29664, Manifold Cover Set
1. Negative battery cables.
2. Air cleaner and intake manifold
   • Install J-29664 in the cylinder heads.
3. Injection pump fuel solenoid, housing pressure cold advance wires, and the fuel return line.
4. Throttle rod and the return springs.
   • Mark the position of the TPS switch or VRV for installation.
5. Top attaching bolt on the fast idle solenoid. Move the solenoid aside.
6. Throttle cable bracket.
7. Throttle shaft advance cam and fiber washer.
   • Install J-29601 over the throttle shaft with the slots on the tool engaging the pin (figure 22). Put the spring clip over the throttle shaft advance cam and tighten the wing nut. Pull the tool off of the shaft without loosening the wingnut. This provides proper advance cam alignment for assembly.
   • Loosen the face cam screw.
   • Drive the pin from the throttle shaft.
8. Any burrs from the throttle shaft that may have resulted from pin removal.
9. Injection pump cover screws.

Clean
   • Injection pump cover.
   • Upper portion of the pump.
   • The guide stud area.
   • Place several rags in the engine valley to catch fuel.

NOTICE: Extreme care must be used to keep foreign material out of the pump when the cover is off. If any objects are dropped into the pump, they must be removed before the engine is started or injection pump and engine damage could occur.

10. Injection pump cover.
11. The guide stud and washer.
   • Note location of parts prior to removal.

• Observe the position of the metering valve spring over the top of the guide stud (figure 19). This position must be exactly duplicated during assembly.

12. Min-max governor assembly (figure 21).
   • Rotate the assembly up to provide clearance.
   • If the idle governor spring becomes disengaged from the throttle block, it must be reinstalled with the tightly wound coils toward the throttle block.

13. The throttle shaft assembly.

Inspect
   • Throttle shaft for unusual wear or damage.
   • Throttle shaft bushings for damage or unusual wear or leaks.
     — Remove the pump and send it to the local Stanadyne dealer if bushing replacement is necessary.

14. The throttle shaft seals.
   • Do not attempt to cut the seals, as nicks in the seal seat will cause leakage.

Install or Connect

Tools Required:
J-29601, Injection Pump Timing Adapter
J-33198, Synkut Oil Seal Lubricant

1. New throttle shaft seals.
   • Use care not to cut the seal on the sharp edges of the shaft.
   • Apply J-33198 or a light coating of clean chassis grease to the seals.

2. The throttle shaft to the point where the min-max governor assembly will slide back onto the shaft.

3. Throttle shaft and governor into position.
   • Rotate the min-max governor assembly downward (figure 21).

4. New mylar washer, the throttle shaft advance cam, and a new throttle shaft drive pin (figure 22).
   • Do not tighten the cam screw.

5. J-29601 over the throttle shaft with the pin in the slots and the spring clip over the advance cam.

6. A 0.006-inch feeler gage between the white washer on the throttle shaft and the pump housing (figure 23).

Tighten
   • Cam screw to 3.1 N·m (30 in. lbs.).
     — Squeeze the throttle shaft.
     — Secure the screw with Loctite 290 or equivalent.
   • Remove J-29601.

7. The guide stud with a new washer.
   • Make sure that the upper extension of the metering valve spring rides on top of the guide stud.

Tighten
   • The guide stud to 9.5 N·m (85 in. lbs.).
     — Overtightening the guide stud may strip the aluminum threads in the housing.

8. New pump cover seal in the pump cover.
9. The pump cover.
   • The screws should not be in the pump cover.
Figure 23—Setting Advance Cam to Housing Clearance

- Position the cover about 6 mm (1/4-inch) forward (toward the shaft end) and about 3 mm (1/8-inch) above the pump (figure 22).
- Move the cover rearward and downward into position, being careful not to cut the seal.

10. The cover screws.
- Be careful not to drop or lose the flat washer and spring washer on each screw.
- The flat washer must be against the pump cover.

11. The cover screws.
- Be careful not to drop or lose the flat washer and spring washer on each screw.
- The flat washer must be against the pump cover.

12. Tighten
- Screws to 3.7 N·m (33 in. lbs.).

13. TPS switch or VRV.
14. Battery negative cables.

Inspect
- Turn the ignition switch to the run position and touch the pink wire to the solenoid connector. A clicking noise should be heard as the wire is connected and disconnected. If this clicking is not heard, the linkage may be jammed in the wide open throttle position and the engine **MUST NOT BE STARTED.** If clicking is not heard, remove the cover and ground the solenoid lead (opposite the hot lead) and connect the pink wire. With the ignition switch in the run position, the solenoid in the cover should move the linkage. If not, the solenoid must be replaced. Minimum voltage across the terminals must be 12.0. Install the cover and repeat the inspection.

15. Fuel return line, throttle cable, and the return springs.
17. Housing pressure cold advance wire.
18. Injection pump fuel solenoid wire.
- Start the engine and check for leaks.
- Idle roughness may be observed due to air in the pump. Engine idling will allow the air to purge.
- It may be necessary to shut the engine down for several minutes to allow air bubbles to rise to the top of the pump.

19. Intake manifold and air cleaner.
- Remove J-29664.

Figure 24—Cold Advance and Shutdown Solenoids

**SHUTDOWN AND/OR COLD ADVANCE SOLENOID REPLACEMENT**

(Property removal or disconnect controls) (Figure 24)

1. Pump cover.
   - Refer to "Pump Cover Seal And/Or Guide Stud Seal Replacement."
2. Terminal contact nuts.
   - Note the positions of the insulating washers.

(Property installation or connection) (Figure 24)

1. Solenoid in the pump cover.
   - On the shutdown solenoid, make sure that the linkage is free.
   - On the cold advance solenoid, make sure that the plunger is centered so that it will contact the check ball in the fitting.
2. Insulating washers on the terminal studs (where used).
3. Terminal nuts.

Tighten
- Nuts to 1.2 N·m (12 in. lbs.).

4. Pump cover.
   - Refer to "Pump Cover Seal And/Or Guide Stud Seal Replacement."

Inspect
- Solenoid operation prior to installing the pump cover. Use a 12 V DC power source.
SIDE COVER GASKET REPLACEMENT

Remove or Disconnect (Figure 25)
1. The two screws (40).
2. Cover (41).
3. Gasket (42).

Install or Connect (Figure 25)
1. Gasket.

**DRIVE SHAFT SEAL REPLACEMENT**

**Remove or Disconnect (Figure 31)**

Tool Required: J-29692-B, Holding Fixture

1. Injection pump.
2. Fast idle solenoid bracket.
   - Mount the pump in J-29692-B and tilt it.
3. The drive shaft from the pump using a rotating motion (alignment pin at the top).
   - The shaft is retained by an o-ring.
   - Make sure that no pieces of the o-ring have broken off in the pump.
4. The drive shaft seals.

**Install or Connect (Figure 31)**

Tools Required:

- J-29692-B, Holding Fixture
- J-29745-A, Shaft Seal Protector
- J-33198, Synkut Lubricating Oil

1. One black seal on the shaft using J-29745-A.
   - Lubricate the seal protector with J-33198 or equivalent.
2. The red seal using J-29745-A.
   - Lubricate the seal protector with J-33198 or equivalent.
3. The other black seal using J-29745-A.
   - Lubricate the seal protector with J-33198 or equivalent.
4. New o-ring retaining clip on the shaft.
5. Drive shaft into the pump.
   - Make sure the drill points on the drive shaft end match up with the rotor.
7. Injection pump.

**PRESSURE TESTING THE INJECTION PUMP**

1. Drain all fuel from the pump.
2. Connect an air line to the pump inlet connection.
   - Make sure the air supply is clean and dry.
3. Completely immerse the pump in a bath of clean test oil.
   - Seal off the return line fitting.
4. Raise the air pressure in the pump to 137.9 kPa (20 psi). Keep the pump immersed in the oil for 10 minutes to allow any trapped air to escape.

5. Watch for leaks after the ten minutes. If the pump is not leaking, reduce the air pressure to 13.8 kPa (2 psi) for 30 seconds. If there is still no leakage, increase the pressure to 137.9 kPa (20 psi). If there are no leaks, the pump is ready for use.

ELECTRICAL SYSTEM

Engine electrical system diagnosis includes the battery, charging system (generator and related wiring), cranking system (starter and related wiring), ignition system (distributor, spark plugs and wiring) and the glow plug system (diesel electrical).

Light duty emission vehicles are equipped with an electronic computer command control system. These vehicles have a "Check Engine" or "Service Engine Soon" lamp on the instrument panel. Refer to the Fuel and Emissions Service Manual for a detailed description of the lamp's operation and use as a diagnostic indicator.

Some vehicles sold in Canada may have variations in electrical components. Refer to the appropriate Canadian Service Manual Supplement.

BATTERY

Figure 1—Sealed Battery with Side Terminals

DESCRIPTION

The battery has three major functions in the electrical system: first, it provides a source of energy for cranking the engine; second, it acts as a voltage stabilizer for the electrical system; and third, it can, for a limited time, provide energy when the electrical load used exceeds the output of the generator.

The sealed battery as shown in figure 1 is standard. Water never needs to be added. There are no filler caps in the cover. The battery is sealed, except for small vent holes in the cover. The vents allow what small amount of gasses that are produced in the battery to escape. The special chemical composition inside the battery reduces gassing to a very small amount at normal charging voltages. Besides reducing gassing, the special chemistry greatly reduces the possibility of overcharge damage.

Keep the battery in an upright position to prevent electrolyte leakage. Tipping the battery beyond a 45 degree angle in any direction can allow a small amount of electrolyte to leak out the vent hole.

Do not exceed this 45 degree angle when carrying or installing the battery.

Evidence of electrolyte leakage does not always mean the battery is defective.

RATINGS

Batteries are rated according to their reserve capacity in minutes and their cold cranking power in amperes. Both methods involve measuring the battery terminal voltage after a specified time period and discharge current.

The "reserve capacity" is defined as the maximum length of time it is possible to travel at night with minimum electrical load and no generator output. Expressed in minutes, it is the time required for a fully charged 12-volt battery, at a temperature of 27° C (80° F), being discharged at a constant current of 25 amperes, to reach a terminal voltage of 10.5 volts.

The "cold cranking ampere" (CCA) test measures the amperage delivered by the battery at −18° C (0° F) for 30 seconds.

Refer to "Specifications" at the end of this section for battery ratings.
ENGINE ELECTRICAL 6D-3

Figure 2—Built-In Hydrometer

BUILT-IN HYDROMETER

The sealed battery has a special temperature compensated hydrometer built into the cover to show at a glance the battery's state-of-charge. The hydrometer has a green ball within a cage which is attached to a clear plastic rod. The green ball will float at a predetermined specific gravity of the electrolyte. When the green ball floats, it rises within the cage and positions itself under the rod. Visually a green dot then shows in the center of the hydrometer (figure 2). The built-in hydrometer provides a guide for battery testing and charging.

When looking at the hydrometer, make sure that the battery has a clean top. A lamp may be needed in some poorly-lit areas.

1. GREEN DOT VISIBLE: The state of charge is 65 percent or more of the full charge.
2. DARK; GREEN DOT NOT VISIBLE: The state of charge is below 65 percent. Charge the battery until the green dot appears. (Shake the battery slightly to make the green dot appear after charging).
3. CLEAR OR LIGHT YELLOW: The fluid level has dropped below the bottom of the hydrometer. This can be caused by a broken case, tipping of the battery, normal wearout, or overcharging because of a problem in the electrical system. Check the system and replace the battery.

GENERAL INFORMATION

COMMON CAUSES OF MALFUNCTION

If testing shows the battery to be in good condition but the battery doesn't perform satisfactorily, check for the following:

1. Vehicle accessories left on overnight.
2. Extended slow-speed driving with many accessories turned on.
3. The vehicle electrical load is more than the generator output, particularly with the addition of aftermarket equipment.
4. Problems in the charging system such as shorts, slipping fan belt, or worn generator or regulator parts.
5. Loose or poor battery cable-to-post connections, previous improper charging of a rundown battery, or loose hold-downs.
6. High-resistance connections in the cranking system.
7. Electronic devices draining the battery when the vehicle is parked for a long period of time. Disconnect the negative cable if the vehicle will be stored for more than 30 days.

Electrolyte Freezing

The freezing point of electrolyte depends on its specific gravity. Since freezing may ruin a battery, protect it against freezing by keeping it in a charged condition.

Carrier And Hold-Down

The carrier and hold-down should be clean and free from corrosion before battery installation.

The carrier should be in a sound mechanical condition so that it will support the battery securely and keep it level. Make certain there are no foreign objects in the carrier before installation.

To prevent the battery from shaking in its carrier, tighten the hold-down bolts. However, do not tighten the bolts to where the battery case or cover is placed under a severe strain.
In a diesel-equipped vehicle, check and test each battery separately.

### VISUAL INSPECTION

Check for obvious damage such as a cracked or broken case or cover that could permit loss of electrolyte. If damaged, replace the battery. Determine the cause of the damage and correct.

### HYDROMETER TEST

- **GREEN DOT VISIBLE:** If the hydrometer has a GREEN DOT visible the battery is ready for testing. Proceed to “Load Test”.
- **DARK; GREEN DOT NOT VISIBLE:** Charge the battery as outlined under the heading “Battery Charging Procedure” later in this section.
- **LIGHT OR BRIGHT INDICATOR:** Do not charge, test, or jump start the battery. Replace the battery.

### LOAD TEST

If the battery is in the vehicle, make sure the engine control switch is off. If there is more than one battery, check each separately.

1. Disconnect the battery cables from the terminals.
2. Install adapter AC-Delco ST 1201 or equivalent (figure 3).
3. If adapters are not available, use a 3/8-inch 16 UNC bolt and stainless steel nut (figure 4). Finger tighten. Contact must be made through the lead pads at the face of the terminals, not through the threads of the bolt.
4. Attach terminal hex nuts, AC Delco # 7802, or equivalent (figure 5).
5. Attach the alligator clamps of the tester or charger between the terminal nuts and the load pads of the terminal studs (figure 5).
   - If the tester clamps cannot be attached between the nuts and the lead pads of the terminals, the ampere load for the load test may change. Refer to “Specifications” at the end of this section.
6. Install a voltmeter and battery load tester to the adapters.
7. Remove the surface charge from recently charged batteries by applying a 300-ampere load across the adapters for 15 seconds.
8. Do not remove the surface charge from batteries which have been in storage.
9. Turn the load off and wait 15 seconds for the battery to recover.
10. Apply the specified load selected from the chart in “Specifications”. Observe the battery voltage after 15 seconds with the load connected, then turn off the load.

11. If the battery voltage does not drop below the minimum voltage as shown in the “Voltage and Temperature Chart” following, the battery is good and should be returned to service. (The battery temperature must be estimated by feel and by the temperature the battery has been exposed to for the preceding few hours.) If the battery voltage drops below the minimum voltage listed, replace the battery.

**BATTERY ON-VEHICLE SERVICE**

**BATTERY CHARGING PROCEDURES**

The following basic rules apply to any sealed battery charging situation:

1. Do not charge a battery if the hydrometer is clear or light yellow—replace the battery.

2. Charge rates between 3 and 50 amperes are satisfactory as long as spewing of electrolyte does not occur or the battery does not feel over 52° C (125° F). If spewing occurs or temperature exceeds 52° C (125° F), the charging rate must be reduced or temporarily halted to permit cooling. Estimate battery temperature by touching or feeling the battery case.

3. The battery is sufficiently charged when the green dot in the built-in hydrometer is visible. No further charging is required. Shake or tilt the battery at hourly intervals during charging to mix the electrolyte and see if the green dot appears.

4. Battery charging consists of a charge current in amperes for a period of time in hours. Thus a 25-ampere charging rate for 2 hours would be 50 ampere-hour charge to the battery. In most cases, batteries whose load test values are less than 200 amperes will have the green dot visible after at least a 50 ampere-hour charge. Most batteries whose load test values are greater than 200 amperes will have the green dot visible after at least a 75 ampere-hour charge. In the event that the green dot does not appear after this amount of charging, continue charging for another 50 or 75 ampere-hours. If the green dot still does not appear, replace the battery.

5. The time required for a charge will vary according to:

a. Size of battery — Example: A discharged large heavy-duty battery requires more than twice the recharging as a discharged small passenger car battery.

b. Temperature — Example: A longer time will be needed to charge any battery at -18° C (0° F) than at 27° C (80° F). When a fast charger is connected to a cold battery, the current accepted by the battery will be very low at first; then, as the battery warms, it will accept a higher rate.

c. State-of-charge — Example: A discharged battery requires more than twice as much charge as a one-half-charged battery. Because the electrolyte is nearly pure water and therefore a poor conductor, the current accepted is low at first. Later, as the charging current causes the electrolyte acid content to increase, the charging current will likewise increase.

d. Charger Capacity — Example: A charger which can supply only 5 amperes will require a much longer period of charging than a charger that can supply 30 amperes or more.

**CURRENT DRAIN TEST**

If a battery needs recharging and no cause is evident, check the vehicle for excessive current drain.

- Remove or Disconnect
  - Negative battery cable (both negative cables on diesels).
**CAUTION:** To prevent possible personal injury from a moving vehicle or operating engine do the following before performing the checks:
1. Engage the parking brakes and block the wheels.
2. Place the manual transmission in the neutral position or the automatic transmission in park.
3. On gas engines disconnect the battery feed at the distributor. On diesel engines disconnect the battery feed at the engine shutoff (ESO) solenoid.

1. Check the voltage drop between ground (negative battery terminal) and the vehicle frame. Place one prod of the test voltmeter on the grounded battery post (not on the cable clamp) and the other on the frame. Operate the starter and note the voltage reading.
2. Check the voltage drop between the positive battery terminal and starter terminal stud with starter operating.
3. Check the voltage drop between the starter housing and frame with the starter operating.
4. If the voltage drop in any of the above is more than 1.0 volt, there is excessive resistance in the circuit. To eliminate resistance, the cables should be disconnected and connections cleaned. If cables are frayed or the clamps corroded, the cables should be replaced. When selecting new cables, be sure they are at least as large as the ones being replaced.

**BATTERY CABLES**

Excessive resistance caused by poor terminal connections and partial short circuits through worn cable insulation will result in an abnormal voltage drop in the starter cable. Low voltage at the starter will prevent normal starter operation and cause hard starting.

**BATTERY REPLACEMENT**

When handling a battery, observe the following safety precautions.
1. Hydrogen gas is produced by the battery. A flame or spark near the battery may cause the gas to ignite.
2. Battery fluid is highly acidic. Avoid spilling on clothing or skin. Any spilled electrolyte should be flushed with large quantities of water and cleaned immediately.

**Remove or Disconnect**
1. Negative cable from the negative battery terminal.
2. Positive cable from the positive battery terminal.
3. Battery hold-down clamp.
4. Battery.

**Inspect**
1. Battery for damage.
2. Cables and connectors.
3. Carrier for damage or foreign objects.
   - If damage is noted, find and correct the cause.

**Install or Connect**
1. Battery into cleaned carrier.
2. Hold-down retainer or top bar, as equipped.
\textbf{Tighten} \\
1. Retainer to 17 N·m (13 ft. lbs.). \\
2. Top bar to 3.5 N·m (30 in. lbs.) on batteries with side terminals. \\
3. Top bar to 6.8 N·m (60 in. lbs.) on batteries with top terminals. \\

\textbf{Tighten} \\
- Top terminals to 17 N·m (13 ft. lbs.). \\
- Side terminals to 15 N·m (11 ft. lbs.).

**CHARGING SYSTEM**

\[\text{Figure 7—12-SI Series 100 Generator}\]

\[\text{Figure 8—17-SI Series 100 Generator}\]

**DESCRIPTION**

The charging system consists of the battery, the generator, the regulator, and the charging system indicator lamp circuitry. The generator supplies electrical power for charging the battery and operating accessories. Two types of generators are used on these vehicles, the SI generator with an external 2-terminal connector on the regulator, and the CS generator with an external 4-terminal connector on the regulator. The diagnostic tests for these generators are different.

**12-SI 100 AND 17-SI 100 GENERATORS (Figures 7, 8 and 9)**

These generators are of the "Systems Integral" series (generator with built-in regulator).

The solid state regulator components are enclosed into a solid mold, and this unit, along with the brush holder assembly, is attached to the slip ring end frame. The regulator voltage setting cannot be adjusted.

The generator rotor bearings contain enough grease to eliminate the need for periodic lubrication. Two brushes carry current through the two slip rings to the field coil mounted on the rotor, and under normal conditions will provide long periods of attention-free service.

The stator windings are assembled on the inside of a laminated core that forms part of the generator frame. The 12-SI has a "Y" stator and the 17-SI has a delta-wound stator. A rectifier bridge connected to the stator windings contains six diodes, and electrically changes the stator AC voltages to a DC voltage which appears at the generator output (BAT) terminal. Generator field current is supplied through a diode trio which also is connected to the stator windings. A capacitor or condenser, mounted in the end frame, protects the rectifier bridge and diode trio from high voltages, and suppresses radio noise.

No periodic adjustments or maintenance of any kind is required on the entire generator assembly.
When the engine control switch is turned to "Run" or "Start", the switch closes and current from the battery flows through the charging system indicator lamp, the number 1 terminal, the regulator, ground, and back to the battery. Current also flows through the generator field coil and back to the battery. The charge indicator lamp then turns on.

With the generator operating, direct current (DC) voltage is applied to the battery through the "BAT" terminal. Some of the output flows through the diode trio to the field coil, then through the wire at terminal number 1 to the charge indicator lamp. The lamp goes out since approximately the same voltage is present at both sides of the lamp. On vehicles with gauges, a voltmeter indicates voltage.

CS-130 GENERATORS (Figures 10, 11 and 12)

These generators feature a high ampere output per pound of weight. The CS stands for charging system and 130 is the measurement in millimeters of the outside diameter of the stator laminations.

This generator with integral regulator does not have a diode trio. The delta stator, rectifier bridge, and rotor with slip rings and brushes are electrically similar to other generators. A conventional fan and pulley are used, and an internal fan cools the slip rings, end frame, rectifier bridge and regulator.

The charge indicator lights when the engine control switch is closed, and goes out when the engine is running. If the charge indicator is on with the engine running, a charging system problem is indicated. The indicator will glow at full brilliance, not half lit, if any charging problem occurs or if the system voltage is too high or too low.

The regulator voltage setting varies with temperature, and limits system voltage by controlling rotor field current. It switches rotor field current on and off at a fixed frequency of about 400 cycles per second. By varying the on-off time, correct average field current for proper system voltage control is obtained. At high speeds, the on-time may be 10 percent and the off-time 90 percent. At low speeds, with high electrical loads, on-off time may be 90 percent and 10 percent respectively.

The regulator has four terminals, "P," "L," "I," and "S" (figure 12). The use of the "P," "L," and "S" terminals is optional. The "P" terminal is connected to the stator, and may be wired to a tachometer or other device. The "S" terminal may be wired to the battery to sense voltage to be controlled. The "L" and "I" terminals serve to turn on the regulator and allow field current to flow when the switch is closed. The "I" terminal may be connected directly to the switch, or through a resistor. Both are illustrated. The "I" circuit may be used with or without the "L" circuit; that is, with or without anything connected to the "L" circuit. Refer to the Light Duty Truck Wiring Diagrams for specific application.

The generator is not serviceable, and no periodic maintenance is required.

DIAGNOSIS OF CHARGING SYSTEM

NOISY GENERATOR

Noise from a generator may be caused by a loose drive pulley, loose mounting bolts, worn or dirty bearings, worn diode or stator. If the pulley and mounting bolts are snug and the noise continues, remove the generator for inspection and repair. Refer to “Generator Replacement” later in this section.

ELECTRICAL TESTS

Before performing the diagnosis procedures on the vehicle, be certain that the system wiring is good and the generator belt is not slipping. Also, the battery must be fully charged for a valid test of the charging system.

NOTICE: To avoid damage to the vehicle electrical system, observe the following precautions:

- Do not polarize the generator.
- Do not short across or ground any of the terminals in the charging circuit except as specifically instructed herein.
- NEVER operate the generator with the output terminal open-circuited.
- Make sure the generator and battery have the same ground polarity.
- When connecting a charger or booster battery to the vehicle battery, connect negative to negative and positive to positive.

Trouble in the charging system will show up as one or more of the following conditions:

1. On vehicles without gages, unusual operation of the charging indicator lamp.
2. An undercharged battery, indicated by slow cranking or a dark battery hydrometer.
3. An overcharged battery, indicated by spewing of electrolyte from the vents.

SI CHARGING SYSTEM

CHARGING SYSTEM INDICATOR LAMP OPERATION

Check the indicator lamp for normal operation in the “Charging System Diagnosis,” (figure 13). If lamp operation is normal, proceed to “Undercharged Battery”.

UNDERCHARGED BATTERY

Slow cranking or a dark battery hydrometer can be caused by one or more of the following conditions even though the indicator lamp may be operating normally. The following procedures also apply to vehicles equipped with a voltmeter.

1. Check that the undercharged condition has not been caused by accessories having been left on for extended periods.

2. Check the drive belt for proper tension. Refer to ENGINE COOLING (SEC. 6B) for belt specifications.
3. If you suspect the battery is bad, do a load test. Refer to “Battery” earlier in this section.
4. Inspect the wiring for cracks or breaks. Check all circuit connections, cable clamps and battery terminals for tightness and cleanliness.
5. With the engine control switch on and all wiring harness leads connected, use a voltmeter for the following checks:

- Install or Connect (Figures 7 and 8)
  1. Voltmeter from the generator battery terminal to ground.
     • Should read 12 volts.
  2. Voltmeter from the number 1 terminal to ground.
     • Should read one volt or more.
  3. Voltmeter from the number 2 terminal to ground.
     • Should read 12 volts.

A zero reading on any of the above indicates an open between the voltmeter connection and the battery. If checks 1 through 5 are normal perform the generator output test.

OVERCHARGED BATTERY

If the battery feels hot, is spewing electrolyte, or lamps seem too bright when turned on, an overcharged condition may exist.

To check the voltage, install a voltmeter across the battery. Run the engine at moderate speed with all accessories off. If the voltage reads 15.5 or more, remove the generator for repair.

GENERATOR OUTPUT TEST (Figure 14)

1. Disconnect the battery ground cable.
2. Connect an ammeter in the circuit at the battery terminal of the generator.
3. Reconnect battery ground cable.
4. Turn on the radio, windshield wipers, headlamps (high beam) and blower motor high speed.
5. Connect a carbon pile across the battery.
6. Run the engine at moderate speed (about 2,000 rpm) and adjust the carbon pile to obtain maximum current output.
7. If the ampere output is within 10 amperes of the rated output as stamped on the generator frame, the generator is probably all right.
8. If the vehicle is equipped with a charging system indicator lamp, and the lamp remains on while the engine runs, and ampere output is normal, remove the generator for repair. Check the diode trio and rectifier bridge.
9. If the ampere output is not within 10 percent of the rated output in amperes, see if the test hole is accessible (figure 15). If it is not accessible go to step 14.
10. Ground the field winding by inserting a screwdriver into the test hole.

13. If the output is not within 10 amperes of rated output, remove the generator and check the field winding, diode trio, rectifier bridge and stator.

14. If the test hole is not accessible, remove the generator for repair.

**GENERATOR DIAGNOSTIC TESTER INDICATIONS**

If a tester is available, check the generator following the tester manufacturer's instructions. It will indicate about 98 percent of the charging system problems.

**TRANSISTORIZED VOLTAGE REGULATOR TEST**

Connect a fast charger and a voltmeter to the battery as shown in figure 16. With the engine control switch on "run" and the engine off, slowly increase the charge rate. The charging system indicator lamp (on vehicles without gages) will dim at the voltage regulator setting. The setting should be at a minimum of 13.5 volts and a maximum of 16.0 volts.

This test works if the rotor circuit is good, even if the stator, rectifier bridge or diode trio is bad.

**CS-130 CHARGING SYSTEM**

**CIRCUIT DIAGNOSIS**

Trouble in the charging system will show up as one or more of the following conditions:

- Abnormal indicator lamp operation.
- An undercharged battery as evidenced by slow cranking or dark hydrometer.
- An overcharged battery as evidenced by excessive spewing of electrolyte from the vents.
A basic wiring diagram for the charging system is shown in figure 12. When the system is operating normally, the indicator lamp (on vehicles so equipped) will come on when the engine control switch is turned on and go out when the engine starts. If the lamp operates abnormally, or if an undercharged or overcharged battery condition occurs, the following procedure may be used to diagnose the charging system. Remember that an undercharged battery is often caused by accessories being left on overnight, or by a switch stuck closed which allows a lamp, such as a trunk or glove box lamp, to stay on.

This generator does not have a test hole.

**DIAGNOSTIC TEST FOR CS-130**

1. Check belt for wear and tension. Refer to ENGINE COOLING (SEC. 6B) for belt tension. Check wiring.

2. Go to Step 5 for vehicles without a charge indicator lamp.

3. With the engine control switch on and the engine stopped, the lamp should be on. If not, detach the wiring harness at the generator and ground the “L” terminal lead.
   - If the lamp lights, replace the generator.
   - If the lamp does not light, locate the open circuit between the grounding lead and the engine control switch. The lamp may be open.

4. With the switch on, and the engine running at moderate speed, the lamp should be off. If not, detach the wiring harness at the generator.
   - If the lamp goes out, replace the generator.
   - If the lamp stays on, check for a grounded “L” terminal wire in the harness.

5. If the battery is undercharged or overcharged:
   - Detach the wiring harness connector from the generator.
   - With the switch on and engine not running, connect a voltmeter from ground to the “L” terminal in the wiring harness, and to the “I” terminal, if used. The wiring harness may connect to either “I” or to both.
   - A zero reading indicates an open circuit between the terminal and the battery. Correct as required.
   - Connect the harness connector to the generator and run the engine at moderate speed with accessories off.
   - Measure the voltage across the battery. If above 16 volts, replace the generator.
   - Connect an ammeter at the generator output terminal, turn on the accessories and load the battery with a carbon pile to obtain maximum amperage. Maintain voltage at 13 volts or above.
     - If the output is within 15 amperes of the rated output, the generator is OK. (Refer to “Specifications” at the end of this section.)
     - If the output is not within 15 amperes of the rated output, replace the generator.
GENERATOR BENCH CHECK
1. Make connections as shown in figure 17, except leave the carbon pile disconnected. The ground polarity of the generator and battery must be the same. The battery must be fully charged. Use a 30 to 500 ohm resistor between the battery and the "L" terminal.
2. Slowly increase generator speed and observe the voltage.

3. If the voltage is uncontrolled and increases above 16 volts, the rotor field is shorted, the regulator is not working properly, or both. A shorted rotor field coil can cause problems in the regulator.
4. If the voltage is below 16 volts, increase speed and adjust the carbon pile to obtain maximum amperage output. Maintain the voltage above 13 volts.
5. If the output is within 15 amperes of the rated output, the generator is good.
6. If the output is not within 15 amperes of the rated output, replace the generator.

GENERATOR ON-VEHICLE SERVICE

GENERATOR REPLACEMENT
The removal and installation instructions serve only as a guide. Additional operations may be required on some vehicles to remove other equipment to gain access to the generator, drive belts and brackets.

CAUTION: Failure to observe Step 1 in this procedure may result in an injury from the hot battery lead at the generator.

Remove or Disconnect
1. Negative battery cable at the battery.
2. Terminal plug and battery lead from the back of the generator.
   • Loosen the upper mounting/adjusting bolt on the generator mounting.
   • Loosen the belt tensioner (serpentine belt only).
3. Drive belt.
4. Lower mounting bolt.

Install or Connect
1. Generator to the top bracket with the bolt.
   • Do not tighten.
2. Lower mounting bolt to the bracket.
3. Generator drive belt.
4. Upper generator mounting bolt. Refer to "Specifications" at the end of this section.
5. Terminal plug and battery lead to the back of the generator.
6. Negative battery cable to the battery.

Refer to the Light Duty Truck Unit Repair Manual for off-vehicle service.
**DESCRIPTION**

In the diesel engine, air alone is compressed in the cylinder; then after the air has been compressed a charge of fuel is sprayed into the cylinder and ignition occurs due to the heat of compression. Eight glow plugs are used to preheat the chamber as an aid to starting (figure 18).

The diesel glow plug system consists of an integral-electronic control/glow plug relay assembly, 6-volt glow plugs, a glow plug inhibit temperature switch and a "GLOW PLUGS" lamp.

**GLOW PLUGS**

These are 6-volt heaters (operated at 12 volts) that turn on when the engine control switch is turned to the run position prior to starting the engine. They remain pulsing a short time after starting, then automatically turn off.

**INSTRUMENTATION**

Vehicles with the diesel engine have special instrumentation indicators to permit the operator to properly apply the starting procedure. A "GLOW PLUGS" lamp on the instrument panel provides this information on engine starting conditions.

Vehicles equipped with diesel engines have a "WATER IN FUEL" lamp and "LOW COOLANT" lamp. Refer to the engine fuel and engine cooling sections for information on these systems.

**ELECTRONIC CONTROLLER/GLOW PLUG RELAY ASSEMBLY (Figures 19 and 20)**

The assembly contains the circuitry which monitors and controls glow plug relay operation. Information is received at pins B and C which is used by the controller to determine glow plug operating requirements. Pin B senses voltage at the starting motor solenoid. Pin C senses glow plug voltage through the glow plug inhibit switch which is wired in series with the glow plug voltage sense lead to the glow plugs. The controller is mounted at the rear of the left cylinder head on two 10 mm studs.

**GLOW PLUG INHIBIT SWITCH**

The switch is temperature controlled and opens above 51.5° C (125° F) to prevent glow plug operation above this temperature. It is mounted at the rear of the right cylinder head on the P truck and G van, and in the water crossover near the front of the engine on the RV truck.

**CIRCUIT OPERATION**

A normal functioning system operates as follows:

A. Key on - Engine not running and at room temperature.
   1. Glow plugs ON for 4 to 6 seconds, then OFF for about 4.5 seconds.
   2. Then cycle; ON for about 1.5 seconds, OFF for about 4.5 seconds, and continue to cycle 1.5 ON/4.5 OFF, for a total duration (including the initial 4 to 6 seconds) of about 20 seconds.
B. If the engine is cranked during or after the above sequence, the glow plugs will cycle ON/OFF for a total duration of 25 seconds after the engine control switch is returned from the crank position, whether the engine starts or not. The engine does not have to be running to terminate the glow plug cycling. All the times shown above are approximate because they vary with initial engine temperature. The initial ON time and cycling ON/OFF times vary also with system voltage and/or temperature. Lower temperatures cause longer duration of cycling.

**DIAGNOSIS OF GLOW PLUG ELECTRICAL SYSTEM**

**CIRCUIT CHECK**

If the system does not operate as described, check the following:

1. Inspect
   1. All connectors.
   2. Engine harness ground connection to the engine.

2. tightened
   - Nut to 11 N·m (8 ft. lbs.).
   3. Four-wire connector at controller. It must be fully seated and latched.
   4. Both controller copper stud upper nuts.

3. Tighten
   - Nuts to 5 N·m (48 in. lbs.).
   - Do not tighten lower nuts.

5. Temperature switch connector at top rear right cylinder head on the P and G truck, and in the water crossover near the front of the engine on the RV truck.

6. "GLOW PLUG" lamp on instrument panel for tight connection and operation.

**GLOW PLUG INHIBIT SWITCH**

Check the temperature-controlled switch to make sure it is closed at low temperatures and open at high temperatures.

1. Remove the connector from the inhibit switch when the engine temperature is below 38°C (100°F).
2. Set the ohmmeter on a low range or use a self-powered test lamp.
3. Test across the terminals.
4. The switch should be closed (test lamp on or a reading of less than 0.1 ohm on the meter).
Connect an ammeter in series (induction type meter may also be used)* with red or orange wire leading from the top of the controller to the left bank of glow plugs. Operate the system and note the ammeter reading. Repeat the procedure for the red or orange wire leading from the top of the controller to the right bank of the glow plugs. Operate the system and note the reading.

Operate the system and note the reading on ammeter. Repeat procedure for each glow plug. Each individual wire should have a reading of approximately:

- Test lamp lights
  - Harness OK. Replace glow plug.

- Test lamp does not light when glow plugs are operating
  - Repair or replace harness. Re-test glow plug for proper operation.

5. Test terminals to ground with a test lamp or the ohmmeter on a high range. The lamp should be off or the meter show greater than 1.0 megohm.

6. Replace the switch if it tests open across the terminals or if either terminal is closed to ground.

7. Disconnect the plug from the switch terminals when the engine is above 52° C (125° F).

8. Set the ohmmeter on the highest scale or use a self-powered test lamp. Test across the terminals. Test from each terminal to ground. Switch should be open (test lamp off or high ohm reading of greater than 1 megohm on the meter).

9. Replace the switch if it is closed.

10. Set the ohmmeter on the highest scale or use a self-powered test lamp. Test across the terminals. Test from each terminal to ground.

11. Replace the switch if it is closed.

12. When installing the switch, use a socket wrench.

13. When installing the switch, use a socket wrench.

GLOW PLUG SYSTEM

If all connections are intact, but the glow plug system does not operate as stated, do the system diagnosis shown in figure 21. It provides a fast way to find if the glow plug system is working properly. Use this procedure whenever there is doubt about correct system operation. Then refer to the diagnostic chart in figure 22 to pinpoint the condition.

NOTICE: Do not manually bypass the relay in the glow plug controller. Do not jump start with more than a 12-volt system. The glow plugs could be damaged.

GLOW PLUG ON-VEHICLE SERVICE

Check the system and its components on the vehicle. None of the components are serviceable. When installing new components and making connections, be sure that connections are tight and torque values are used. Torque the glow plugs to 17 N-m (12 ft. lbs.) when installed.

CRANKING SYSTEM

DESCRIPTION

CRANKING CIRCUIT

The basic cranking circuit consists of the battery, starter motor, engine control switch, neutral sensing or neutral start switch, and related electrical wiring (figure 23).

STARTER MOTOR

Two types of starter motors are used in the vehicles covered in this manual (figures 24 and 25). Both have the shift lever mechanism and the solenoid plunger enclosed in the drive housing to protect them from exposure to dirt, icing conditions and splash.

GLOW PLUG AFTERSTART

The glow plug controller provides glow plug operation after starting a cold engine. This after-start operation is initiated when the engine control switch is returned to “RUN” from the “START” position. While loss of this function may not cause a cold start complaint, it may result in excessive white smoking and/or poor idle quality after start. To check for proper operation of this circuit proceed as follows:

1. With the engine cold 27° C (80° F), turn the engine control switch to the RUN position and let the glow plugs cycle.

2. After 2 minutes crank the engine for 1 second. (It is not important that the engine starts.) Return the engine control switch to RUN. Glow plugs should cycle at least once after cranking.

3. If the plugs do not turn on, disconnect the controller connector, and check the connector harness terminal B with a grounded 12-volt test lamp. The lamp should be off with the engine control switch in RUN, and on when the engine is cranked.

4. If the lamp does not operate as just described, repair a short or open in the engine harness purple wire.

5. If the lamp works right, but the afterstart glow plug feature does not, replace the controller.

Refer to figures 26, 27 and 28 for a diagnosis of the cranking system. Before removing any unit in the system for repair, make the following checks.

**CRANKING CIRCUIT**

**BATTERY**

Determine the condition of the battery. Refer to "Battery" earlier in this section for battery diagnosis and testing.

**WIRING**

Inspect the circuit wiring for damage. Inspect all connections to the starter motor, solenoid, engine control switch, and battery, including all ground connections. Clean and tighten all connections as required.

**SOLENOID AND CONTROL SWITCHES**

Check all switches to determine their condition. A vehicle equipped with an automatic transmission has a neutral start switch which allows the vehicle to be started in Park or Neutral. It is located on the steering column near the floor. A vehicle with a manual transmission has a neutral start switch attached to the clutch.

The P truck with a 7.4L engine has a magnetic switch in the cranking circuit (figure 29).

**Magnetic Switch Check (Figure 30)**

To operate properly, the switch requires at least 11 volts. Connect a voltmeter across the winding. Close the engine control switch. If the voltmeter reads less than 11 volts, locate and repair the problem in the engine control switch, battery, or wiring. If the voltage reads 11 volts or above, yet the voltage does not seem to be reaching the starter, replace the magnetic switch.

STARTER MOTOR NOISE

Refer to the starter noise diagnostic chart. Starter shims are shown in figure 31 and 32.

PINION CLEARANCE

1. Remove the lower flywheel housing cover.
2. Inspect the flywheel for signs of unusual wear such as chipped or missing gear teeth or the flywheel being bent. If the flywheel needs replacing, refer to "Engine Mechanical" earlier in this manual.
3. Start the engine and gently touch the outside diameter of the rotating flywheel ring gear with chalk or crayon to show the high point of tooth runout after the engine is turned off. Turn the engine off and rotate the flywheel so that the marked teeth are in the area of the starter pinion gear.
4. Disconnect the negative battery cable to prevent accidental cranking of the engine.
5. Insert a screwdriver in the small hole in the bottom of the starter (shown by the arrow in figure 33) and move the starter pinion and clutch assembly so that the pinion teeth and flywheel teeth are meshed. If necessary, rotate the flywheel so that a pinion tooth is directly in the center of two flywheel teeth and on the centerline of the two gears (figure 34).
6. Measure the clearance between the top of the pinion tooth and the bottom of the flywheel tooth using the width of the wire gage (figure 34). Normal clearance is 0.5 to 1.5 mm (0.02 to 0.06-inch).
7. If the clearance is less than 0.5 mm (0.02-inch) and the starter whines after firing, shim the starter away from the flywheel.
   - Diesel engine (figure 31):
     Add shims as required. Total shim stack must not exceed 4.0 mm (0.16-inch). If starter shims are not available, washers made of shim stock can be used.
   - Gas engines (figure 32):
     Add 1.0 mm (0.04-inch) shims, one at a time, to both long bolts between starter mounting pads and engine until noise problem is corrected. Do not use more than 2 shims total.
8. If the pinion clearance is more than 1.5 mm (0.06 inch) and the starter whines during cranking, shim the starter towards the flywheel.
   - Diesel engine (figure 31):
     Add a 1.0 mm (0.04-inch) shim between the starter motor mounting pad and the engine. If a starter shim is not available, a washer made of shim stock can be used.
   - Gas engines (figure 32):
     Add 0.38 mm (0.015 inch) shims between the outboard starter mounting pad and engine until the noise stops. Do not add more than 4 shims total.

9. When shimming is done, torque the mounting bolts.

Tighten

1. Gas engine starter motor mounting bolts to 38 N·m (28 ft. lbs.) (figure 34).
2. Diesel engine starter motor (figure 31):
   - Through bolt to 38 N·m (28 ft. lbs.).
   - Nut to 10 N·m (90 in. lbs.).
   - Bolt to 32 N·m (24 ft. lbs.).

## Cranking System On-Vehicle Service

### Maintenance

- Keep starter terminals and all other terminals in the electrical system clean and tight. A loose or corroded connection or terminal will cause excessive resistance in the system which will result in hard starting.
- At regular intervals, inspect the starting system to locate and correct potential causes of trouble before the system performance is affected.
- Starting motors do not require lubrication except during overhaul.

### Starter Motor

- If the battery, wiring and switches are in satisfactory condition, and the engine is functioning properly, remove the motor and refer to the Light Duty Truck Unit Repair Manual.
- Never operate the starter motor more than 30 seconds at a time without pausing to allow it to cool for at least two minutes. Overheating, caused by excessive cranking, will damage the motor.

### Starter Motor Replacement

**Remove or Disconnect**

1. Negative battery cable.
2. Starter braces or shields if equipped.
3. Wires from the starter solenoid.
   - Raise the vehicle.
4. Two bolts, nuts, washers and shims holding the starter to the engine.
5. Starter from the engine.

**Install or Connect**

1. Two bolts, nuts, washer and shims through the starter to the engine.
2. Wires to the solenoid terminals.
3. Braces or shields, if equipped.
4. Negative battery terminal.

**Tighten**

- Bolts to 38 N·m (28 ft. lbs.).
- Lower the vehicle.
ENGINE BLOCK HEATERS

DESCRIPTION

The optional engine block heater is used to preheat engine coolant for cold weather starting. The unit consists of a heating coil that fits into the engine block. It has an attached electrical cord with a plug. If the element fails to heat the coolant, check the cord and connections before replacing the element.

INSTALLATION (Figures 35, 36 and 38)

1. Apply a coating of lubricant to the O-ring and to the cleaned surface of the plug opening in the block.
2. Install the hairpin end of the heating coil into the opening and push the support in as far as it will go.
3. Position the block heater as shown for the engine in figure 38.
4. Bolt/screw to 1.8 N·m (16 in. lbs.).
5. Route the heater cord so that it does not touch the engine, hot pipes, manifold, or any moving parts. Refer to figures 37, 39, 40 and 41.
6. Coolant. Refer to ENGINE COOLING (SEC. 6B).

IGNITION SYSTEM

DESCRIPTION

All ignition systems include a battery, a distributor, an engine control switch, spark plugs, and the primary and secondary wiring. Information on the battery is located earlier in this section. Refer to CAB ELECTRICAL (SEC. 8A) for information on the engine control switch.

There are two different ignition systems used on these vehicles. If the vehicle has a carbureted engine, spark is controlled by the module inside the distributor with an integral coil. If the vehicle engine is equipped with throttle body injection (TBI), the ignition system includes a knock sensor, an electronic spark control module, a computer (ECM), and a distributor with a separate coil.

DISTRIBUTOR

The distributor with an integral coil combines all ignition components in one unit (figures 42 and 43). The coil is in the cap and connects through a resistance brush to the rotor. On a distributor with a separate coil the coil connects to the rotor through a high tension wire (figure 44).

The distributor has an internal magnetic pick-up assembly which contains a permanent magnet, a pole piece with internal teeth and a pick-up coil. When the teeth of the timer core, rotating inside the pole piece, line up with the teeth of the pole piece, an induced voltage in the pick-up coil signals the electronic module to trigger the coil primary circuit. The primary current decreases and a high voltage of up to 35,000 volts is induced in the ignition coil secondary winding. This voltage is directed through the rotor and secondary leads to fire the spark plugs. The capacitor in the distributor is for radio noise suppression.

The magnetic pick-up assembly is mounted over the main bearing on the distributor housing. On carbureted engines without computers, the assembly is made to rotate by the vacuum control unit, thus providing vacuum advance. The distributor shaft is mounted on the camshaft at the rear of the engine, and rotates at one-half the rpm of the engine. The force of rotation moves the advance weights against the springs, and provides centrifugal advance to the timer core.

ENGINES WITH TBI

On engines with TBI, spark timing changes are determined electronically by the ECM (computer), which monitors information from various engine sensors, computes the desired spark timing, and signals the distributor.

The distributor does not contain centrifugal weights, springs, or a vacuum advance unit.

Each TBI equipped engine also has a knock sensor mounted in the engine block and connected by a blue wire to a spark control module (called a "half-function box") (figure 45). In response to engine knock, a signal is sent from the sensor to the module and then to the ECM, which computes how much to retard spark timing to reduce knock. A retard command is then sent to the distributor.

Information on TBI and the computer controlled ignition system, system components and their locations, and diagnostic charts are located in the Light Duty Truck Fuel and Emissions Service Manual.

IGNITION TIMING

Timing specifications for each engine are listed on the Vehicle Emissions Control Information label on the radiator support. Always follow Vehicle Emissions Control Information label procedures when adjusting timing. When using a timing light, connect an adapter between the number 1 spark plug and the number 1 spark plug wire, or use an inductive type pick-up. Do not pierce the plug lead. Once the insulation of the spark plug cable has been broken, voltage will jump to the nearest ground, and the spark plug will not fire properly.

Some engines incorporate a magnetic timing probe hole for use with special electronic timing equipment. Consult manufacturer's instructions for use of this equipment.

**SPARK PLUG WIRES**

The spark plug wiring is a carbon impregnated cord conductor encased in an 8mm diameter rubber jacket. The silicone spark plug boots form a tight seal on the plugs. Refer to "Spark Plug Wires" later in this section for service precautions.

**SPARK PLUGS**

Resistor type, tapered seat spark plugs are used on all engines. No gasket is used on these tapered seat plugs. Refer to figures 46 and 47 for an explanation of letter coding on spark plugs. Refer to the Vehicle Emissions Control Information label on the radiator support for correct gap information.

around the insulator, just above the shell crimp. It is the visible evidence of a high-tension field, and has no effect on ignition performance. Usually it can be detected only in darkness. This discharge may repel dust particles, leaving a clear ring on the insulator just above the shell. This ring is sometimes mistakenly regarded as evidence that combustion gases have blown out between shell and insulator.

TEST FOR SEPARATELY MOUNTED COIL
1. Disconnect the distributor lead and wiring from the coil.
2. Connect an ohmmeter as shown in figure 48, step 1. Use the high scale. The reading should be infinite. If not, replace the coil.
3. Connect the ohmmeter as shown in step 2. Use the low scale. The reading should be very low or zero. If not, replace the coil.
4. Connect the ohmmeter as shown in step 3. Use the high scale. The meter should not read infinite. If it does, replace the coil.
5. Reconnect the distributor lead and wiring to the coil.

DIAGNOSIS OF THE IGNITION SYSTEM

DISTRIBUTOR/TIMING SYSTEM FOR TBI-EQUIPPED VEHICLES

CAUTION: To prevent possible personal injury from a moving vehicle or operating engine do the following before performing the checks:
1. Engage the parking brake and block the wheels.
2. Place the automatic transmission in park or the manual transmission in neutral.
3. Refer to figure 49, 50 and 51 for system diagnosis.
4. Refer to the Light Duty Truck Unit Repair Manual for distributor component checks.

IGNITION SYSTEM FOR CARBURETED ENGINE

CAUTION: To prevent possible personal injury from a moving vehicle or operating engine do the following before performing the checks:
1. Engage the parking brake and block the wheels.
2. Place the automatic transmission in park or the manual transmission in neutral.
3. Refer to the Fuel and Emissions Service Manual for information on the computerized ignition system, including the diagnostic use of the "Check Engine" or "Service Engine Soon" lamp.
4. Refer to the Light Duty Truck Unit Repair Manual for distributor component checks.

### IGNITION SYSTEM ON-VEHICLE SERVICE

**SERVICE PRECAUTIONS**

Some service tachometers and electronic diagnostic equipment may NOT be compatible with these ignition systems. Consult your representative of such equipment to update your equipment for compatibility with these systems.

1. When making compression checks, disconnect the engine control switch feed wire at the distributor. When disconnecting this connector release the locking tab while pulling downward on the connector body; do not use a screwdriver or tool to release the locking tab as it may break the tab.

2. No periodic lubrication is required. Engine oil lubricates the lower bushing and an oil-filled reservoir provides lubrication for the upper bushing.

**NOTICE:** The tachometer terminal must NEVER be allowed to touch ground, as damage to the module and/or ignition coil can result.

3. On integral coil distributors, the tachometer (TACH) terminal is next to the engine control switch (BAT) connector on the distributor cap. On distributors with separate coils, the TACH terminal is at the coil (figure 44).

4. There is no dwell adjustment since this is controlled by the module.

5. The material used to construct the spark plug wires is very pliable and soft. This wire will withstand more heat and carry a higher voltage. Due to the more pliable wire, scuffing and cutting become easier. Route the spark plug wires correctly to prevent chaffing or cutting. When removing a spark plug wire from a spark plug, twist the boot on the spark plug and pull on the boot to remove the wire.
DISTRIBUTOR REPLACEMENT

Some components, such as the engine cover or air cleaner, may need to be removed to reach the distributor.

DISTRIBUTOR WITH INTEGRAL COIL

Remove or Disconnect
1. Engine control switch battery feed wire from the distributor cap.
2. Tachometer lead (if equipped) from the cap.
3. Ignition coil connector from the cap.
   - Do not use a screwdriver or tool to release the locking tabs.
4. Distributor cap by pressing down on the four spring-loaded screws and turning the latches to the left.
5. Vacuum hose from the vacuum advance unit (if equipped).
6. Distributor clamp bolt and hold-down clamp from the engine.
   - Note the position of the rotor, then pull the distributor up until the rotor just stops turning to the left and again note the position of the rotor.
7. Distributor.

Install or Connect
To ensure correct timing of the distributor it must be installed with the rotor correctly positioned as noted in step 7 of the removal procedure.
If the engine was accidentally cranked after the distributor was removed, the following procedure can be used for installation:
   - Remove the number 1 spark plug.
   - Place finger over the number 1 spark plug hole and crank the engine slowly until compression is felt.
   - Align the timing mark on the pulley to “0” on the engine timing indicator.
   - Turn the rotor to point between number 1 and number 8 spark plug towers on the distributor cap on V8 engines and between number 1 and number 6 on 6 cylinder engines.
1. Distributor.
   - If the distributor shaft won’t drop into the engine, first insert a screwdriver into the hole for the distributor and turn the oil pump drive shaft.
2. Distributor hold-down clamp and clamp bolt.
3. Vacuum hose to the vacuum unit (if equipped).
4. Cap on the distributor.
   - The aligning tab on the cap should engage with the notch in the housing.
5. Four hold-down spring latches.
6. Ignition coil connector to the cap.
7. Engine control switch battery feed wire.
8. Tachometer lead (if equipped).
   - Set ignition timing as described later in this section.

DISTRIBUTOR WITH SEPARATE COIL

Remove or Disconnect
1. Negative battery cable.
2. Wiring harness connectors at the side of the distributor cap.
3. Distributor cap and move it out of the way.
   - Scribe a mark on the engine in line with the rotor.
   - Note the position of the distributor housing in relation to the engine.
4. Distributor hold-down nut and clamp.
5. Distributor.

Install or Connect
To ensure correct timing of the distributor it must be installed with the rotor correctly positioned as noted in step 3 of the removal procedure.
If the distributor shaft won’t drop into the engine, insert a screwdriver into the hole for the distributor and turn the oil pump driveshaft.
1. Distributor.
2. Hold-down nut and clamp.
3. Distributor cap.
4. Wiring harness connector at the side of the cap.
5. Engine cover and console.
6. Negative battery cable.

COIL REPLACEMENT

Remove or Disconnect
1. Negative battery cable.
2. Engine control switch and tachometer terminals at the coil.
3. Coil to distributor lead at the coil.
4. Nuts holding the coil bracket and coil to the engine bracket.
5. Coil bracket and coil.
   - Drill and punch out the two rivets holding the coil to the bracket.
6. Coil from bracket.

Install or Connect
Coil to the bracket with two screws.
Coil bracket to the engine bracket with studs and nuts.
Coil to the distributor lead at the coil.
Engine control switch and tachometer connectors to the coil.
Negative battery cable.

IGNITION TIMING

1. Refer to the Vehicle Emissions Control Information label located on the radiator support. Follow all instructions on the label.
2. Refer to the Fuel and Emissions Service Manual for timing information for engines equipped with TBI.
3. With the engine control switch off, connect the pick-up lead of a timing light to the number 1 spark plug. Use a jumper lead between the wire and plug or an inductive type pick-up. DO NOT pierce the wire
or attempt to insert a wire between the boot and the wire. Connect the timing light power leads according to the manufacturer’s instructions.

4. Disconnect the vacuum hose from the distributor if so equipped.

5. Start the engine and aim the timing light at the timing mark (figure 52). The line on the balancer or pulley will line up at the timing mark. If a change is necessary, loosen the distributor hold-down clamp bolt at the base of the distributor. While observing the mark with the timing light, slowly rotate the distributor until the line indicates the correct timing. Tighten the hold-down bolt, and re-check the timing.

6. Turn off the engine and remove the timing light. Reconnect the number 1 spark plug wire, if removed.

7. Connect the vacuum hose to the distributor if so equipped.

**SPARK PLUG WIRE REPLACEMENT**

Wire routings must be kept intact during service, and followed exactly when wires have been disconnected, or when replacement of the wires is necessary. Failure to route the wires properly can lead to radio ignition noise and crossfiring of the plugs, or shorting of the leads to ground. For the correct wiring routing for each engine, refer to figures 53 through 61.

Some distributors have spark plug wire retainer harness assemblies with the engine firing order marked on them. If the firing order is not indicated, install the plug wires according to the firing order as shown in figures 62, 63 and 64. When the wiring is completed, the plug wire from cylinder number 1 should lead to the distributor tower at the front and on the same side of the engine as cylinder number 1. The plug wire from cylinder number 6 (in 6 cylinder engines) or from cylinder number 8 (in V8 engines) should lead to the distributor tower at the front of the engine next to the number 1 tower.

Be sure to position all plug boots perpendicular to the centerline of the engine.

On the LE8 (7.4 L V8) engine, the spark plug harness assembly and a dielectric paper insulator are fitted to a shield which is installed over the spark plug (figure 65). The insulator grounds the shield to the engine block. If the assembly is removed from the shield, make sure that the insulator is present and undamaged before reinstallation.

**SPARK PLUG WIRES**

**PRECAUTIONS**

1. Twist boots 1/2 turn before removing.

2. When removing the boot, do not use pliers or other tools that could tear the boot.

3. Do not force anything between the wire and the boot, or through the silicone jacket of the wire.

4. Do not pull on the wires to remove the boot. Pull on the boot, or use a tool designed for this purpose.

5. Special care should be exercised when installing spark plug boots to assure that the metal terminal within the boot is fully seated on the spark plug terminal and that the boot has not moved on the wire. If boot to wire movement has occurred, the boot will give a false visual impression of being fully seated. A good check to assure that boots have been properly assembled is to push sideways on the installed boots. If they have been correctly installed, a stiff boot with only slight looseness will be noted. If the terminal has not been properly seated on the spark plug, only the resistance of the rubber boot will be felt when pushing sideways.

ENGINE WIRE HARNESS

When it necessary to move any of the wiring, whether to lift wires away from their harnesses or move harnesses to reach some component, take care that all wiring is replaced in its original position and all harnesses routed correctly. If clips or retainers break, replace them. Electrical problems can result from wiring or harnesses becoming loose and moving from their original positions or from being rerouted. Refer to figures 66 through 94 for the correct routing of engine wiring.

GENERAL INFORMATION

DRIVEABILITY

The driveability diagnosis procedures apply to various systems in current GM vehicles. The procedures assume that the vehicle worked right at one time and the problem is due to time, wear, dirt or other causes. Start with the introduction that follows. This will describe a systematic diagnostic procedure.

Any system disconnected during diagnosis should be reconnected. This includes wires, hoses, linkage, etc. When removing air cleaner, plug hose fittings that could cause an air leak.

EMISSIONS

The exhaust emission control systems used on General Motors engines perform a specific function to lower exhaust emissions while maintaining good fuel economy and driveability.

MAINTENANCE SCHEDULE

Refer to the General Motors Maintenance Schedule in Section 0B of this Service Manual for the maintenance service that should be performed to retain emission control performance.

VEHICLE EMISSION CONTROL INFORMATION LABEL

The Vehicle Emissions Control Information label (Fig. 1) contains important emission specifications and setting procedures. In the upper left corner is exhaust emission information which identifies the year, the manufacturing division of the engine, the displacement in liters of the engine, the class of vehicle and type of fuel metering. Also there is an illustrated emission component and vacuum hose schematic. This label is located in the engine compartment of every General Motors Corporation vehicle. If the label has been removed, it can be ordered from the parts division. (WDDGM)

VISUAL/PHYSICAL UNDERHOOD INSPECTION

One of the most important checks that must be done as part of any diagnostic procedure is a careful visual/physical underhood inspection. This can often lead to fixing a problem without further steps. Inspect all vacuum hoses for correct routing, pinches, cuts, or disconnects. Be sure to inspect hoses that are difficult to see beneath the air cleaner, compressor, generator, etc. Inspect all the wires in the engine compartment for correct and good connections, burned or chaffed spots, pinched wires, or contact with sharp edges or hot exhaust manifolds. This visual/physical inspection is very important. It must be done carefully and thoroughly.
"Always refer to the vehicle emission control information label for the correct and most current specifications".

ALL NEW GENERAL MOTORS VEHICLES ARE CERTIFIED BY THE UNITED STATES ENVIRONMENTAL PROTECTION AGENCY AS CONFORMING TO THE REQUIREMENTS OF THE REGULATIONS FOR THE CONTROL OF AIR POLLUTION FROM NEW MOTOR VEHICLES. THIS CERTIFICATION IS CONTINGENT ON CERTAIN ADJUSTMENTS BEING SET TO FACTORY STANDARDS. IN MOST CASES, THESE ADJUSTMENT POINTS EITHER HAVE BEEN PERMANENTLY SEALED AND/OR MADE INACCESSIBLE TO PREVENT INDISCRIMINATE OR ROUTINE ADJUSTMENT IN THE FIELD. FOR THIS REASON, THE FACTORY PROCEDURE FOR TEMPORARILY REMOVING PLUGS, CAPS, ETC., FOR PURPOSES OF SERVICING THE PRODUCT, MUST BE STRICTLY FOLLOWED AND, WHEREVER PRACTICABLE, RETURNED TO THE ORIGINAL INTENT OF THE DESIGN.

INTRODUCTION

GENERAL DESCRIPTION

The engine has controls to reduce exhaust emissions while maintaining good driveability and fuel economy. The following emission controls are on all engines:

- Positive Crankcase Ventilation (PCV)
- Exhaust Gas Recirculation (EGR)
- Thermostatic Air Cleaner (THERMAC)
- Air Injection Reaction (AIR)
- Early Fuel Evaporation (EFE)
- Evaporative Emission Control (EECS)
- Throttle Return Control (TRC)
- Deceleration Control

Positive Crankcase Ventilation (PCV)

All engines have closed Positive Crankcase Ventilation System to provide more complete scavenging of crankcase vapors. Ventilation air is drawn from the dirty air side of the air cleaner, through a hose, down into the crankcase, up through the ventilator valve, through a hose and into the intake manifold. Intake manifold vacuum draws any fumes from the crankcase to be burned in the engine.

EXHAUST GAS RECIRCULATION (EGR)

The Exhaust Gas Recirculation system is used on all engines. It meters exhaust gas into the induction system for recirculation through the combustion cycle to reduce oxides of nitrogen emissions.

The EGR valve remains closed during periods of engine idle and deceleration to prevent rough idle from excessive exhaust gas dilution in the idle air/fuel mixtures. It also remains closed at wide open throttle to prevent power loss.

Thermostatic Air Cleaner (THERMAC)

The Thermostatic Air Cleaner is designed to keep air entering the carburetor at approximately 100°F. Keeping the air at 100°F, or more, improves engine warm-up driveability, and will help minimize carburetor icing.

Air Injection Reaction (AIR)

The Air Injection Reaction system provides additional oxygen to the exhaust gases to continue the combustion process.

EARLY FUEL EVAPORATION (EFE)

The EFE system is used to provide a source of rapid heat to the engine induction system during cold driveaway. Rapid heating is desirable because it provides for quick fuel evaporation and more uniform fuel distribution to aid cold driveability.

Evaporative Emission Control

This system has a canister which stores fuel vapor from the fuel tank and the carburetor. The fuel vapor is removed from the canister and consumed in the normal combustion process when the engine is running.

Throttle Return Control (TRC)

The Throttle Return Control system helps to prevent an over-rich condition on deceleration. The vacuum operated Throttle Kicker will not allow the throttle to close fully until the engine speed falls below a specified RPM. By holding the throttle open slightly, more air is allowed to enter the engine to maintain a more efficient air/fuel ratio.

Deceleration Control

The deceleration control uses a deceleration valve to control emissions and back-fire on deceleration. When deceleration causes a sudden rise in manifold vacuum, the deceleration valve will open to admit fresh air to the inlet manifold. After a calibrated time delay, the valve will close. The system is mainly used with manual transmission equipped vehicles.

DRIVEABILITY SYMPTOMS

BEFORE STARTING
Verify the customer complaint, and locate the correct symptom below. Check the items indicated under that symptom.

If the ENGINE CRANKS BUT WILL NOT RUN, see "No Start — Engine Cranks OK" below.

DISTRIBUTOR INFORMATION
Refer to Section 6D, Engine Electrical, for Ignition System including distributor information.

CARBURETOR ADJUSTMENT
Carburetor adjustment and specifications can be found in Section 6C1, Carburetors.

VISUAL CHECK
Several of the symptom procedures below call for a careful visual check. This check should include:
• Vacuum hoses for splits, kinks, and proper connections, as shown on Vehicle Emission Control Information label.
• Air leaks at carburetor mounting and intake manifold.
• Ignition wires for cracking, hardness, proper routing, and carbon tracking.
• Wiring for proper connections, pinches, and cuts. The importance of this step cannot be stressed too strongly — it can lead to correcting a problem without further checks and can save valuable time.

WON’T START — ENGINE CRANKS OK
Definition: Engine cranks OK, but does not start. May fire a few times.

• Make sure proper starting procedure is being used. See Owner’s Manual.
• Visual check:
  — Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  — Ignition wires for cracking, hardness and proper connections at both distributor cap and spark plugs.
• Remove air cleaner:
  — Check carburetor choke valve, vacuum break(s), linkage and unloader operation. See Section 6C. Set to specifications. Choke valve should move smoothly and be closed when cold, and open when hot.
• Check for presence of fuel by noting carburetor accelerator pump operation. Look for gas squirt in carburetor bore while quickly opening throttle lever.
  — If no pump squirt:
    • Check for fuel in tank.
    • Check carburetor fuel inlet filter. Replace if dirty or plugged.
  — If there is a pump squirt:
    • Check fuel pump capacity.
    • If fuel pump checks OK, check float needle for sticking in seat, or binding float.
• Remove spark plugs. Check for wet plugs, cracks, wear, improper gap, burned electrodes, or heavy deposits. Repair or replace as necessary.
• Visually check distributor cap inside and out for moisture, dust, cracks, burns, and arcing to coil mounting screws.
• Try to turn distributor shaft by hand. Drive pin may be broken.
• Very cold temperatures:
  — Check that the proper viscosity oil is being used, and crank case oil is not contaminated with gasoline.
HARD START — COLD

Definition: Engine cranks OK, but does not start for a long time. Does eventually run. If the engine starts but immediately dies (as soon as key is released from start position), see "No Start, Engine Cranks OK" symptom.

- Make sure driver is using correct starting procedure. See Owner's Manual.
- Visual check:
  - Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  - Air leaks at carburetor mounting and intake manifold.
  - Ignition wires for cracking, hardness, and proper connections, at both the distributor cap and spark plugs.
  - Wiring for proper connections, pinches and cuts.
- Check the choke valve, throttle and fast idle cam for sticking. Replace any malfunctioning parts. If caused by foreign material and gum, clean with suitable non-oil base solvent. See Section 6C.
- Check choke and vacuum break operation and adjustment. Choke should be closed cold. See Section 6C.
- Check EGR system for sticky operation that could cause valve to stick open.
- Check float level using external float gage. Adjust float to specification if required. See Section 6C.
- Check carburetor fuel inlet filter. Replace if dirty or plugged.
- Check ignition system — see Section 6D. Check distributor for:
  - Worn shaft.
  - Bare and shorted wires.
  - Pick-up coil resistance and connections.
  - Loose ignition coil ground.
  - Moisture in distributor cap.
- Remove spark plugs; check for wet plugs, wear, improper gap, burned electrodes or heavy deposits. Repair or replace as necessary.
- Check ignition timing per Vehicle Emission Control Information label.
- Verify proper engine oil viscosity per recommendations in Maintenance Schedule.
- Check fuel pump volume, pressure and vacuum.

HARD START — HOT

Definition: Engine cranks OK, but does not start for a long time. Does eventually run. If the engine starts but immediately dies (as soon as key is released from start position), see Ignition System Diagnosis, Section 6D.

- Visual (physical) check:
  - Vacuum hoses for splits, kinks, and proper connections, as shown on Vehicle Emission Control Information label.
  - Ignition wires for cracking, hardness, and proper connections, at the distributor cap and spark plugs.
  - Wiring for proper connections, pinches and cuts.
- Make sure driver is using correct starting procedure. See Owner's Manual.
- Check choke valve, throttle linkage and fast idle cam for sticking.
- Check choke and vacuum break operation and adjustment. Choke should be open hot. See Section 6C.
- Check EGR system. EGR valve should be open.
- Check EGR for sticky operation that could cause valve to stick open.
- Check for obvious overheating problems:
  - Low coolant.
  - Loose water pump belt.
  - Restricted air flow to radiator, or restricted water flow through radiator.
- Check ignition system, Section 6D. Check distributor for:
  - Worn shaft.
  - Bare and shorted wires.
  - Intermittent pickup coil or connections, module, ignition coil ground and condenser. Repair or replace as necessary.
- Remove spark plugs. Check for cracks, wear, improper gap, burned electrodes, heavy deposits. Repair or replace as necessary.
- Check ignition timing. See Vehicle Emission Control Information label.
STALL AFTER START — COLD

Definition: Engine at room or outside temperature, within three minutes after start. (1) Stalls after brief idle; (2) dies as soon as any load is placed on engine (such as A/C turned “ON” or transmission engaged); or (3) Dies on initial driveaway.

If symptom is present cold and hot, go to symptom “Stall After Start — Hot.”
• Visual (physical) check:
  — Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  • Make sure hot air tube is connected to air cleaner.
  • Check proper operation of THERMAC.
  • Check carburetor choke valve, throttle linkage and fast idle cam for sticking.
  • With engine running, visually check vacuum break linkage for movement while removing and re-installing vacuum hoses to vacuum breaks. If the linkage does not move and vacuum is at hose, check for binding linkage. If linkage OK, replace vacuum break unit.
• With engine “OFF,” check all choke adjustments, including vacuum breaks and TVS if used. See Section 6C.
• Check fast idle speed setting and curb idle speed.
• Check carburetor accelerator pump operation.
• Check EGR valve for proper operation. EGR valve should be closed cold. See Chart C-9C.
• Check EGR valve for proper operation. See Chart C-7C.
• Check engine timing. See Vehicle Emission Control Information label.
• Poor or contaminated gasoline. Suggest owner try different brand.

STALL AFTER START — HOT

Definition: The engine starts OK, but (1) dies after brief idle; (2) dies as soon as any load is placed on engine (such as A/C turned “ON” or transmission engaged); (3) dies on initial driveaway.

• Visual (physical) check:
  — Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  • Make sure hot air tube is connected to air cleaner.
  • Check proper operation of THERMAC.
  • Check carburetor choke and vacuum breaks for proper operation. See Section 6C for check procedure.
  • Check float level using external float gage. See Section 6C.
• Check carburetor accelerator pump operation.
• Check EGR valve for proper operation — Chart C-7C.
• Check for overcharged A/C System.
• Check for obvious overheating problems:
  — Low coolant.
  — Loose water pump belt.
  — Restricted air flow to radiator or restricted water flow through radiator.

HESITATION/SAG, STUMBLE

Definition: Momentary lack of response as the accelerator is pushed down. Can occur at all vehicle speeds. Usually most severe when first trying to make vehicle move, as from a stop sign. May cause the engine to stall if severe enough.

• Visual (physical) check:
  — Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  — Ignition wires for cracking, hardness, and proper connections, at both distributor and spark plugs.
  — Wiring for proper connections, pinches and cuts.
  • Make sure hot air tube is connected to air cleaner.
  • Check proper operation of THERMAC. See diagnosis of THERMAC.
  • Note: Cold engine only — check the following for sticking or faulty operation:
  — Carburetor choke, including vacuum breaks, throttle linkage and fast idle cam.
  — Check all choke adjustments, including vacuum breaks.
• Check float level using external float gage. See Section 6C.
• Check carburetor accelerator pump operation.
• Check EGR valve operation — Chart C-7C.
• Check canister purge system for proper operation. See Evaporative Emission Control System Diagnosis.
• Check for open ignition coil ground and for intermittent ECM ground.
• Check engine timing. See Vehicle Emission Control Information label.
• Poor or contaminated gasoline. Try a different brand of gasoline.
SURGES AND/OR CHUGGLE

Definition: Engine power variation under steady throttle or cruise. Feels like the car speeds up and slows down with no change in the accelerator pedal.

- Visual (physical) check:
  - Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  - Ignition wires for cracking, hardness, and proper connections, at both distributor and spark plugs.
  - Wiring for proper connections, pinches and cuts.
- Have driver read explanation of transmission converter clutch and A/C compressor operation in Owner's Manual.
- Make sure hot air tube is connected to air cleaner.
- Check proper operation of THERMAC. See diagnosis of THERMAC.
- Check for intermittent open, or short to ground in TCC circuit.
- Check for proper operation of EGR. See Chart C-7C.
- Check carburetor fuel inlet filter, replace if dirty or plugged.
- Check carburetor float level using external float gage. See Section 6C.
- Test fuel pump capacity. See Section 6C.
- Remove spark plugs, check for cracks, wear, improper gap, burned electrodes or heavy deposits.
- Check condition of distributor cap, rotor and spark plug wires.
- Check for arcing to coil attaching screws in distributor cap.
- Check for intermittent ground connection on integral ignition coil.
- Poor or contaminated gasoline. Try a different brand of gasoline.

LACK OF POWER, SLUGGISH OR SPONGY

Definition: Engine delivers less than expected power, little or no increase in speed when accelerator pedal is pushed down part way.

- Visual check:
  - Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  - Ignition wires for cracking, harness, and proper connections, at both the distributor cap and spark plugs.
  - Wiring for proper connections, pinches and cuts.
- Compare customer's vehicle to similar unit. Make sure the customer's vehicle has an actual problem. Was the customer's old vehicle much more powerful?
- Make sure hot air tube is connected to air cleaner.
- Remove air cleaner and check air filter for dirt.
- Check for proper operation of THERMAC. See diagnosis of THERMAC.
- Check for full throttle valve opening in carburetor by depressing accelerator pedal to floor.
- Check carburetor float level using external float gage.
- Check for proper operation of carburetor air valve. See Section 6C.
- Check ignition timing. See Vehicle Emission Control Information label.
- Check transmission for proper downshift and TCC operation.
- Check EGR operation. See Chart C-7C.
- Check EFE Valve.
- Remove spark plugs. Check for cracks, wear, improper gap, burned electrodes, heavy deposits. Repair or replace as necessary.
- Check for an exhaust system restriction:
  1. With engine at normal operating temperature, connect a vacuum gage to any convenient vacuum port on intake manifold.
  2. Run engine at 1000 rpm and record vacuum reading.
  3. Increase rpm slowly to 2500 rpm. Note vacuum reading at steady 2500 rpm.
  4. If vacuum at steady 2500 rpm is more than 3 inches lower than 1000 rpm, exhaust system should be inspected for restrictions. See Chart B-1.
- Check engine valve timing and compression.
- Check engine for proper or worn camshaft, see Section 6A.
- Poor or contaminated fuel. Try a different brand of gasoline.
BACKFIRE

Definition: Fuel ignites in intake manifold, or exhaust system, making a loud popping noise.

- Visual check:
  - Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  - Ignition wires for cracking or hardness proper connection, at both the distributor cap and spark plugs.
  - Chaffed wiring harness by pulleys or metal edges.
- Make sure hot air tube is connected to air cleaner.
- Check proper operation of THERMAC. See diagnosis of THERMAC.
- Note: Cold engine only — check the following for sticking or faulty operation:
  - Carburetor choke, including vacuum break and throttle linkage.
- Check EFE Valve.
- Check carburetor accelerator pump operation.
- Check for proper operation of EGR valve.
- Perform a compression check — look for sticking or leaking valves.
- Check for restricted exhaust system. See Chart B-1.
- Check output voltage of ignition coil. See Ignition System Diagnosis, Section 6D.
- Check operation of decel (gulp) valve if so equipped.
- Check for crossfire between spark plugs, distributor cap, spark plug wires and proper routing of plug wires. Wires for cylinders which fire in sequence on the same side of the engine should not be routed next to each other; i.e., 8 and 4, and 5 and 7. See Section 6D.
- Check for intermittent condition in ignition system.
  - Pick-up coil.
  - Ignition coil ground on integral coil.
  - Ignition coil primary connections.
- Check for proper valve timing.

MISSES (CUTS OUT)

Definition: Pulsation or jerking that follows engine speed, usually more pronounced as engine load increases. The exhaust may have a steady spitting sound at idle or low speed. Not normally felt above 1500 rpm or 30 rpm (48 km/h).

- Visual (physical) check:
  - Vacuum hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
  - Ignition wires for cracking, hardness and proper connections at both distributor cap and spark plugs.
  - Wiring for proper connections, pinches and cuts.
- Check spark plug wire routing for correct firing order.
- Check for misfiring at spark plugs:
  1. Disconnect and plug air cleaner and EGR vacuum hoses.
  2. Check spark at all plug wires with J26792 (ST-125).
     - If there is no spark on any cylinder, see "Ignition System Diagnosis," Section 6D.
     - Spark at all cylinders.
- Visually check distributor cap inside and out for moisture, dust, cracks, burns and check for coil arcing to mounting screws. With engine running, spray cap and plug wires with fine water mist to check for shorts.
- Check for poor ground on integral ignition coil.
- Check EGR valve for sticking partially open.
- Remove spark plugs and check for cracks, wear, improper cap, burned electrodes and heavy deposits.
- Check pickup coil in distributor with ohmmeter, and check for proper connections at module. Pickup coil should be 500–1500 ohms and not grounded. See Sec. 6D.
  - If pickup coil checks OK,
    - Check for ignition dwell increase from low to high rpm by connecting dwell meter to distributor "TACH" terminal. If dwell doesn’t increase, replace ECM.
- Remove rocker covers, check for bent pushrods, worn rocker arms, broken valve springs, worn camshaft lobes. Repair as necessary. See Section 6A.
ROUGH, UNSTABLE OR INCORRECT IDLE; STALLING

Definition: The engine runs unevenly at idle. If bad enough, the car may shake. Also, the idle speed may vary (called “hunting”). Either condition may be bad enough to cause stalling. Engine idles at incorrect speed.

- Visual (physical) check:
  - Vacuum hoses for splits, kinks and proper connections as shown on Vehicle Emission Control Information label.
  - Ignition wires for cracking, hardness, or proper connections, at both distributor cap and spark plugs.
- Check throttle linkage for sticking or binding.
- Check carburetor for flooding.
- Check float level using external float gage. See Section 6C.
- Check engine idle speed. See Vehicle Emission Control Information label.
- Check EGR System. See Chart C-7C. There should be no EGR at idle.
- If rough idle occurs hot, perform these additional checks:
  - Check PCV valve for proper operation by placing finger over inlet hole in valve end several times. Valve should snap back. If not, replace valve.
  - Check canister purge and bowl vent control system. See Evaporative Emission Control System Diagnosis.
  - Remove carbon with top engine cleaner. Follow instructions on can.
  - Check for proper spark plug gap.
  - Run a cylinder compression check. See Section 6.
- Check ignition timing. See Vehicle Emission Control Information label.
- Check for exhaust system restriction. See Chart B-1.

WON'T IDLE

Definition: Engine starts OK, but dies at idle. Will run if accelerator pedal is held at part throttle.

- Visual (physical) check:
  - Vacuum hoses for splits, kinks and proper connections as shown on Vehicle Emission Control Information label.
  - Air leaks at carburetor mounting and intake manifold.
- Check carburetor float level using external float gage. See Section 6C.
- Check for carburetor flooding. See Section 6C.
- Check EGR system. See Chart C-7C. Check for a loose valve or sticking EGR plunger. If sticking operation is found, clean or replace valve. There should be no EGR at idle. It may be necessary to remove the valve to check for leaking.
- Check engine idle speed. See Vehicle Emission Control Information label.
- Check carburetor idle adjustment. If unable to adjust, check carburetor idle system. See Section 6C.
- Check spark plug condition and gap.
- Check for exhaust system restriction. See Chart B-1.

POOR FUEL ECONOMY

Definition: Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, economy is noticeably lower than it was on this car at one time, as previously shown by an actual road test.

- Check owner's driving habits.
  - Is A/C on full time (defroster mode on)?
  - Are tires at correct pressure?
  - Are excessively heavy loads being carried?
  - Is acceleration too much, too often?
- Check air cleaner damper door operation (THERMAC).
- Check air cleaner element (filter) for dirt or being plugged.
- Check for proper calibration of speedometer.
- Visual check:
  - Vacuum hoses for splits, kinks and proper connections as shown on Vehicle Emission Control Information label.
  - Ignition wires for cracking, hardness and proper connections.
- Check ignition timing. See Vehicle Emission Control Information label.
- Remove spark plugs. Check for cracks, wear, improper gap, burned electrodes or heavy deposits. Repair or replace as necessary.
- Check compression. See Section 6A.
- Check TCC for proper operation.
- Check for dragging brakes.
- Suggest owner fill fuel tank and recheck fuel economy.
- Check for exhaust system restriction. See Chart B-1.
**DIESELING, RUN-ON**

**Definition:** Engine continues to run after key is turned "OFF," but runs very roughly. If engine runs smoothly, check ignition switch and adjustment.

- **Visual check:**
  - Vacuum hoses for splits, kinks and proper connections as shown on Vehicle Emission Control Information label.
  - Carburetor choke, throttle linkage and fast idle cam for sticking.
- **Check carburetor choke, vacuum break linkage, throttle linkage and fast idle cam for proper adjustment. See Section 6C.**
- **Check cruise control for proper adjustment.**
- **Check engine idle speed.**
- **Check ignition timing.** See Vehicle Emission Control Information label.
- **Remove carbon with top engine cleaner. Follow instructions on can.**
- **Check for engine overheating. Normal coolant temperature is 85°C–100°C (185°F–215°F).**
  - Low coolant.
  - Loose water pump belt.
  - Restricted air flow to radiator, or restricted water flow through radiator.
  - Inoperative fan clutch.

**DETONATION/SPARK KNOCK**

**Definition:** A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with throttle opening. Sounds like popcorn popping.

- **Check EGR System for proper operation. See Chart C-7C.**
- **Check ignition timing.** See Vehicle Emission Control Information label.
- **Check for obvious overheating problems. 85°C–100°C (185°F–215°F) is normal.**
  - Low coolant.
  - Loose water pump belt.
  - Restricted air flow to radiator, or restricted water flow through radiator.
  - Inoperative fan clutch.
- **Check for air leaks at carburetor mounting and intake manifold.**
- **Check for poor fuel quality, proper octane rating.**
- **Remove carbon with top engine cleaner. Follow instructions on can.**
- **If excessive carbon in cylinders, check for leaking valve seals.**
- **Check for improper operation of transmission (i.e., linkage adjustment) and TCC.**
- **Check for incorrect basic engine parts, such as cam, heads, pistons, etc.**

**EXCESSIVE EXHAUST EMISSIONS (ODORS)**

**Definition:** Car fails an emission test. May also have excessive “rotten egg” smell (hydrogen sulfide).

- **If test shows excessive CO and HC (also has excessive odors):**
  - Check items which cause car to run rich.
    - Make sure engine is at normal operating temperature.
    - Visually check hoses for splits, kinks and proper connections, as shown on Vehicle Emission Control Information label.
    - Remove air cleaner and check air filter for dirt or being plugged. Replace as necessary.
    - Check for misadjusted idle mixture if plugs are removed.
    - Check choke valve and linkage for sticking of faulty operation.
    - Check choke, vacuum breaks and fast idle adjustments.
    - Check for stuck PCV valve or obstructed hose.
    - Check for lead contamination of catalytic converter. Check for absence of filler neck restrictor.
- **Check operation of air management system. See appropriate C-6HD Chart in Air Injection Reaction section.**
- **Check carburetor for flooding.**
- **Check float level using external float gage. See Section 6C.**
- **Check canister for loading and check purge system for proper operation. See Evaporative Emission Control System Diagnosis.**
- **Check for incorrect idle speed.**
- **Check for incorrect timing.** See Vehicle Emission Control Information label.
- **Check condition of spark plugs, plug wires and distributor cap.**
- **If test shows excessive NOx:**
  - Check items which cause vehicle to run lean, or to run too hot.
    - Check EGR valve for not opening. See Chart C-7C in Section C.
    - Check for vacuum leaks.
    - Check for inoperative THERMAC.
Proper diagnosis for a restricted exhaust system is essential before any components are replaced. The following diagnostic procedure is recommended:

1. Remove the rubber hose at the exhaust manifold A.I.R. pipe check valve. Remove check valve.

2. Connect a fuel pump pressure gage to a hose and nipple from a Propane Enrichment Device (J26911) (see illustration).

3. Insert the nipple into the exhaust manifold A.I.R. pipe.

4. With the engine at normal operating temperature and running at 2500 rpm, observe the exhaust system backpressure reading on the gage.

5. If the backpressure exceeds 2 3/4 psi, 19 kPa a restricted exhaust system is indicated.

6. Inspect the entire exhaust system for a collapsed pipe, heat distress, or possible internal muffler failure.

7. If there are no obvious reasons for the excessive backpressure, a restricted catalytic converter should be suspected, and replaced using current recommended procedures.

Chart B-1—Restricted Exhaust System Check
EVAPORATIVE EMISSION CONTROL SYSTEM (EECS)

GENERAL DESCRIPTION

PURPOSE
The Evaporative Emission Control System (EECS) (Figure 5) limits fuel vapor into the atmosphere. The system traps fuel vapor from the fuel tank and carburetor float bowl into a fuel vapor canister. The fuel tank has a non-vented fuel cap and a single vent pipe to the canister. The canister absorbs and stores the fuel vapor in a carbon element until it can be removed and burned during the normal combustion process. When the engine is running, a thermostatic vacuum switch determines when the fuel vapor is purged into the intake air flow.

OPERATION (Figure 5)
This system uses the following control valves:
- Purge control valve mounted on the canister.
- Vapor vent valve mounted on the canister.
- A thermal bowl vent valve (some applications).
- A thermostatic vacuum switch (TVS) installed in the intake manifold to sense engine coolant temperature.

When the engine is shut off, manifold vacuum is lost at the vapor vent valve. The spring loaded valve in the vapor vent valve now connects the carburetor bowl vent to the canister. Carburetor float chamber vapors now pass into the canister for storage. When the engine is restarted, manifold vacuum draws the vapor vent controlling valve against spring pressure, closing off the bowl vent. Ported vacuum from the carburetor is connected to the TVS. When the TVS opens, ported vacuum opens the purge control valve. When the valve opens, manifold vacuum draws vapors from the canister into the intake manifold.

The thermal bowl vent valve (TBVV) is located in the section of hose that connects the carburetor bowl vent fitting to the canister control valve.

The TBVV will close and prevent vapor movement at 32°C (90°F) and below. The TBVV will open at 49°C (120°F) to permit vapor flow to the canister control valve.

FUEL VAPOR CANISTER, PRIMARY (Figure 6)
The basic large size, two chamber closed bottom canister is used on all systems and operates as follows:

Gasoline vapors from the fuel tank flow into the tube labeled "Fuel Tank," and vapors from the carburetor float bowl flow into the tube labeled "CARB BOWL," and are absorbed by the carbon. The canister is purged when the engine is running above idle speed. The closed bottom design keeps water from entering the bottom of the canister, freezing, and restricting purge air flow. During purge, air is drawn from the clean side of the air cleaner, to the tube on the canister labeled "AIR CLNR," through the carbon and into the intake manifold to be burned. Some closed bottom canisters draw purge air directly from the atmosphere.
**CANISTER PURGE CONTROL VALVE** (Figure 6)

The Canister Purge Control Valve is a spring-biased diaphragm valve, normally closed, which allows or prevents purging of the canister. When the engine is off or idling, the spring holds the valve closed, preventing canister purge. When the engine is off-idle, however, timed manifold vacuum pulls the diaphragm upward, opening the valve and allowing the canister to be purged.

**VAPOR VENT CONTROL VALVE** (Figure 6)

The vapor vent control valve prevents venting of the carburetor float bowl during engine operation. A spring-biased diaphragm valve, normally open, allows (or prevents) fuel vapors from the float bowl to enter the canister. When the engine is off, spring tension holds the valve open, allowing normal venting.

When the engine is turned on, however, manifold vacuum pulls the diaphragm up to close the valve.

**FUEL VAPOR CANISTER, AUXILIARY** (Figure 7)

An Auxiliary Fuel Vapor Canister is added to a primary closed bottom canister to increase capacity when a dual (aux.) fuel tank is used. On the bottom is a hose which connects to the primary canister’s purge air inlet. On top is a purge air inlet. Vapor overflowing from the primary canister is stored in the auxiliary canister. During purge, vapor flows through the auxiliary canister, the primary canister and into the intake manifold for burning during combustion.

**DIAGNOSIS OF EECS**

**SYSTEM DIAGNOSIS**

- Poor idle, stalling and poor driveability can be caused by:
  - Inoperative vapor vent valve.
  - Inoperative purge control valve.
  - Damaged canister.
  - hoses split, cracked and, or, not connected to the proper tubes.
Evidence of fuel loss or fuel vapor odor can be caused by:
- Liquid fuel leaking from fuel lines, fuel pump or carburetor.
- Cracked or damaged canister.
- Inoperative bowl vapor vent valve.
- Inoperative purge control valve.
- Disconnected, misrouted, kinked, deteriorated or damaged vapor hoses, or control hoses.
- Bowl vent hose misrouted.
- Air cleaner or air cleaner gasket improperly seated.

FUEL VAPOR CANISTER
Visually check canister and replace if cracked, damaged or saturated with fuel. Apply a short length of hose to the carburetor bowl vapor tube of the canister (lower tube), and blow into it, to determine that air will pass the vapor vent valve into the canister. If not possible to blow into the canister, it must be replaced.

VAPOR VENT CONTROL VALVE

Functional Test
Apply a short length of hose to the carburetor bowl vapor tube of the canister (lower tube), and blow into it to determine that air will pass the vapor vent valve into the canister. If not possible to blow into the canister, it must be replaced.

With a hand vacuum pump, apply vacuum 51 kPa (15" Hg) to the vacuum signal tube on the diaphragm assembly cover. The diaphragm should hold vacuum for at least 20 seconds. If it does not, diaphragm is leaking, and the canister must be replaced.

With vacuum still applied to the vacuum signal tube, again attempt to blow into the carburetor bowl vapor tube of the canister. Now air should not pass vapor vent valve into the canister, indicating that the valve is sealing properly. If air does enter the canister past the vapor vent valve, the valve is not functioning properly, and the canister must be replaced.

PURGE CONTROL VALVE

Functional Test
Apply a short length of hose to the PCV tube of purge valve assembly (lower tube), and attempt to blow through it. Little or no air should pass into the canister. (A small amount of air will pass if the canister has a constant purge hole.)

With a hand vacuum pump, apply vacuum 51 kPa (15" Hg) through the control vacuum signal tube to the purge valve diaphragm. If the diaphragm does not hold vacuum for at least 20 seconds, the diaphragm is leaking, and the canister must be replaced.

If the diaphragm holds vacuum, again try to blow through the hose connected to the PCV tube while vacuum is still being applied. An increased flow of air should be observed. If not, the canister must be replaced.

THERMOSTATIC VACUUM SWITCH (TVS)

Replacement
Thermal vacuum switches opens, closes, or switches vacuum source when the calibration temperature is reached. The following general checking procedures can be used for all thermal vacuum switches. Refer to number stamped on base of valve or switch for calibration temperature.

1. Allow TVS to cool below calibration temperature.
2. Inspect switch to make sure it is in good condition.
3. Connect hand vacuum pump(s) to output port(s) of the TVS. (See vacuum hose schematic on Vehicle Control Emission Information label.)
4. Apply 51 kPa (15" Hg) vacuum.
5. Heat TVS to a temperature above the calibration temperature. Never apply a torch or open flame directly to the TVS.
6. Compare vacuum gage reading to the correct reading indicated on switch or valve base.

NOTICE: Leakage of up to 7 kPa (2" Hg) vacuum in 2 minutes is allowable and does not mean a defective part.
7. If operation is satisfactory, reinstall valve or switch. If valve or switch is defective, replace with a new part.

ON-VEHICLE SERVICE — EECS

SYSTEM HOSES
Refer to Vehicle Emission Control Information label for routing of system hoses.

When replacing hoses, use hose identified with the word “Fluoroelastomer.”

VAPOR PIPE
The vapor pipe is secured to the underbody with clamp and screw assemblies. Flexible hoses are connected at the fuel tank and the fuel vapor canister. The pipe should be inspected occasionally for leaks, kinks or dents and repaired as required.

Repair
Repair vapor pipe in sections using brazed seamless steel tubing meeting GM Specification 123M or its equivalent or hose identified with the word “Fluoroelastomer.” Hose not so marked could cause early failure or failure to meet emission standard.

- Do not use copper or aluminum tubing to replace steel tubing. Those materials do not have satisfactory durability to withstand normal vehicle vibrations.
- Do not use rubber hose within 4 inches (100 mm) of any part of the exhaust system or within 10 inches (254 mm) of the catalytic converter. Hose inside diameter must match steel tubing outside diameter.
1. In repairable areas, cut a piece of fuel hose 4 inches (100 mm) longer than portion of the line removed. If more than a 6-inch (152 mm) length of pipe is removed, use a combination of steel tubing and hose so that hose lengths will not be more than 10 inches (254 mm). Follow the same routing as the original pipe.
2. Cut ends of pipe remaining on vehicle square with a tube cutter. Using the first step of a double flaring tool, form a bead on the end of both pipe sections. If pipe is too corroded to withstand bead operation
without damage, the pipe should be replaced. If a new section of pipe is used, form a bead on both ends of it also.
3. Use screw type hose clamp, Part Number 2494772, or equivalent. Slide clamps onto pipe and push hose 2 inches (51 mm) onto each portion of fuel pipe. Tighten clamps on each side of repair.
4. Pipes must be properly secured to the frame to prevent chafing.

FUEL CAP
If a fuel tank filler cap requires replacement, use only a cap with the same features. Failure to use the correct cap can result in a malfunction of the system.

CANISTER REPLACEMENT
1. Disconnect hoses from canister. Mark hoses for installation on new canister. Also refer to the Vehicle Emission Control Information label.
2. Remove screw from bracket and remove canister.
3. Install canister and connect hose.

AUXILIARY VAPOR CANISTER
Replacement
1. Disconnect hose from canister.
2. Remove screw from bracket and remove canister.
3. Install canister and connect hose.

THERMOSTATIC VACUUM SWITCH
1. Drain coolant below level of switch.
2. Disconnect vacuum hoses.
3. Remove switch.
4. Apply a soft setting sealant to the threads of thermostatic vacuum switch. Sealant should not be on the end of the switch.
5. Install switch, tighten to 14 N·m (120 in. lbs.) and then turn clockwise as required to align with hoses.
6. Connect hoses.
7. Add coolant as required.

AIR INJECTION REACTION (AIR) SYSTEM

GENERAL DESCRIPTION
The heavy duty emission engines with vehicle weight over 8500 GVW have an AIR System with increased air flow. The system is used to reduce carbon monoxide (CO), and hydrocarbon (HC) emissions. The air injection reaction (AIR) system provides additional oxygen to continue the combustion process after the exhaust gases leave the combustion chamber. The system diverts air from the exhaust manifold at increased engine speed or when an electrical malfunction is detected in the system.

The system used on a 4.8 L engine consists of an air pump, air filter, air control valve, check valve, silencer, air temperature switch, control module, and necessary plumbing.

The system used on a 5.7 L or 7.4 L engine consists of two AIR pumps, an air filter, two air control valves, two check valves, a control module and necessary plumbing. The 7.4 L engine also uses a control relay to operate the "SERVICE ENGINE SOON" light.

AIR OPERATION
- The air pump(s) is belt driven on the front of the engine and supplies the air to the system.
- Intake air passes through an external air filter to the air pump(s).
- Air flow from the pump(s) passes through a control valve(s) and an AIR pipe(s) and into the exhaust manifold.
- The check valve prevents back flow of exhaust into the pump in the event of an exhaust backfire or pump drive belt failure.

AIR CONTROL VALVE (HFEAC) (Figure 8)
This valve is a high flow electric air control (HFEAC) valve that has an electric solenoid to combine electronic control with normal diverter valve function.

With ignition "ON," the solenoid is energized through the control module and the air control valve operates like a standardized diverter valve. With the solenoid energized, air is directed to the exhaust manifold. During an engine decel, when there is a rise in the manifold vacuum signal, air is directed to the air cleaner or silencer even though the solenoid is energized. The solenoid is de-energized when there is high engine speed over a prolonged period or a malfunction of the electrical circuit.

"SERVICE ENGINE SOON" LIGHT
If there is a malfunction in the control module, wiring harness or solenoid(s), an amber "SERVICE ENGINE SOON" light will illuminate on the instrument panel. The "SERVICE ENGINE SOON" light is "ON" with the ignition key "ON" and the engine not running as a bulb check (except 7.4 L). When the engine is started, the light will remain on for three to six seconds and then turn off. On a 7.4 L system, with ignition "ON" and the engine not running, the "SERVICE ENGINE SOON" light will come "ON" and stay "ON" for 1-2 seconds and then go "OFF" as a bulb check.

DECELERATION CONTROL (Figure 9)
To help prevent backfiring during high vacuum conditions a deceleration (gulp) valve is used with these AIR systems. The high vacuum draws the deceleration valve diaphragm down and opens the valve allowing air from the air cleaner to flow into the intake manifold. This air enters the air/fuel mixture to lean the rich condition created by high vacuum when the throttle valve closes on deceleration.
The vacuum draws the deceleration valve diaphragm down and opens the valve allowing air from the air cleaner to flow into the intake manifold.

**DIAGNOSIS OF AIR**

**AIR SYSTEM**

**NOTICE:** If the engine or under hood compartment is to be cleaned with steam or high-pressure detergent, the intake air filter should be masked off to prevent liquids from entering the pump.

The AIR System is not completely noiseless. Under normal conditions, noise rises in pitch as engine speed increases. To determine if excessive noise is the fault of the Air Injection Reactor System, operate the engine with the pump drive belt removed. If excessive noise does not exist with the belt removed, check for the following:

- A seized air pump.
- Improper mounting and bolt torque of pump.
- Improper routing and connections of hoses.

**CAUTION:** Do not oil air pump.

- Replace pump if none of the above conditions exist.

**“SERVICE ENGINE SOON” LIGHT**

If the “SERVICE ENGINE SOON” light is on with the engine running, refer to the proper C-6HD Chart for diagnosis.

**AIR PUMP**

The air pump is permanently lubricated and requires no periodic maintenance.

Accelerate engine and observe air flow from hose(s). If air flow increases as engine is accelerated, pump is operating satisfactorily. If air flow does not increase or is not present, proceed as follows:

- **Inspect**
  1. For proper drive belt tension.
  2. For a leaky pressure relief valve. Air may be heard leaking with the pump running.

**AIR CONTROL VALVE**

Air pump should be working properly. Disconnect solenoid connector at valve. With ignition “ON,” check for 12 volts at the connector. If there is no voltage, refer to the proper C-6HD Chart for diagnosis. Start engine. Air should go to the air cleaner or silencer. Connect the solenoid connector and air should go to the exhaust ports. Check for manifold vacuum signal at valve with engine idling. Vacuum should be 10" Hg (94 kPa). During decel and high vacuum signal, air should go to the air cleaner and silencer. Replace valve if any of the conditions are not correct.

**CHECK VALVE**

- **Inspect**
  1. A check valve should be inspected whenever the hose is disconnected from a check valve or whenever check valve failure is suspected. (A pump

---

**Figure 8—Air Control Valve**

**Figure 9—Deceleration Control**
that had become inoperative and had shown indications of having exhaust gases in the pump would indicate check valve failure).

2. Blow through the check valve (toward the cylinder head), then attempt to suck back through the check valve. Flow should only be in one direction (toward the exhaust manifold). Replace valve which does not operate properly.

HOSE AND PIPES
Inspect
1. Hose or pipe for deterioration or holes.
2. All hoses or pipe connections, and clamp tightness.
3. Hose or pipe routing. Interference may cause wear.
4. If a leak is suspected on the pressure side of the system or if a hose or pipe has been disconnected on the pressure side, the connections should be checked for leaks with a soapy water solution. With the pump running, bubbles will form if a leak exists.

CONTROL MODULE
Refer to the proper C-6HD Chart for diagnosis of the control module.

DECELERATION VALVE
1. Remove air cleaner, plug air cleaner vacuum source and connect tachometer.
2. With the engine running at specified idle speed, remove the small deceleration valve signal hose from the manifold vacuum source.
3. Reconnect the signal hose and listen for air flow through the ventilation pipe and into the deceleration valve. There should also be a noticeable speed drop when the signal hose is reconnected.
4. If the air flow does not continue for at least one second or the engine speed does not drop noticeably, check the deceleration valve hoses for restrictions or leaks.
5. If no restrictions or leaks are found, replace the deceleration valve.

"SERVICE ENGINE SOON" LIGHT IS "ON"

The illumination of the "SERVICE ENGINE SOON" light indicates that there is a malfunction in the solenoid, control module, or wiring. Check solenoid and module connectors for proper connection.

1. Disconnect air temperature switch and install a jumper wire across the terminals.
2. With ignition on, disconnect each solenoid connector and with a test light, check for a light from the pink/black wire to ground.
   - If light does not illuminate, check for an open in circuit 39 to the solenoid.
   - If light illuminates, check for a light across terminals. Circuit is OK if there is a light. Check solenoid coil resistance and if less than 20 ohms, replace solenoid and valve. If there is no light, check for an open in circuit 900 to the air temperature switch, an open in circuit 436 or faulty control module.
3. Connect solenoid connectors and disconnect both connectors at control module. Check for a light between terminals "A" and "B" of the 5 pin connector.
   - If the test light does not illuminate, check for an open circuit to the module.
   - If the test light illuminates, check for a light between 5 pin connector harness terminals "A" and "D."
   - If the test light illuminates, check for a short to ground in circuit 419.
   - If the test light does not illuminate, check for an open in circuit 900 between the solenoid terminal "B" and the module 2 pin connector terminal "A." If circuit 900 is not open, replace the control module.

"SERVICE ENGINE SOON" LIGHT IS "ON"

The illumination of the "SERVICE ENGINE SOON" light indicates that there is a malfunction in the solenoid, control module, control relay, or wiring. Before diagnosis, check solenoid and module connectors for proper connection.

1. This step is to determine if there is power to the air temperature switch.
2. This step will insure that there is power to the circuit by eliminating the air temperature switch. This step will also check the wiring between the air temperature switch and the solenoids.
3. This step will check the wiring between the solenoids and ground, including the circuit inside the control module.
4. This step will determine if the problem is a short to ground in the "SERVICE ENGINE SOON" light circuit or a malfunction in the air management system.
5. This step checks for Bat. (+) at "A" and a ground at "B" to power up the control module.
6. This step will determine if a ground signal is sent to the relay because CKT919 is grounded outside the module.
7. This step checks for a tach signal to the control module.

"SERVICE ENGINE SOON" LIGHT IS "ON"

The illumination of the "SERVICE ENGINE SOON" light indicates that there is a malfunction in the solenoid, control module, or wiring. Check solenoid and module connectors for proper connection.

1. Disconnect the air temperature switch and install a jumper wire across the terminals.
2. With the ignition on, disconnect the solenoid connector and with a test light, check for a light from the pink/black wire to ground.
   - If the light does not illuminate, check for an open in circuit 39 to the solenoid.
   - If the light illuminates, check for a light across the terminals. The circuit is OK if there is a light. Check the solenoid coil resistance and if less than 20 ohms, replace the solenoid and valve. If there is no light, check for an open in circuit 936 to the air temperature switch, an open in circuit 436 or a faulty control module.
3. Connect the solenoid connector and disconnect both connectors at the control module. Check for a light between terminals "A" and "B" of the 5 pin connector.
   - If the test light does not illuminate, check for an open circuit to the module.
   - If the test light illuminates, check for a light between the 5 pin connector harness terminals "A" and "D."
     - If the test light illuminates, check for a short to ground in circuit 419.
     - If the test light does not illuminate, check for an open in circuit 936 between the solenoid terminal "B" and the module 2 pin connector terminal "A." If circuit 936 is not open, replace the control module.
GENERAL DESCRIPTION

PURPOSE

The EGR system is used to lower NOx (oxides of nitrogen) emission levels caused by high combustion temperatures. It does this by decreasing combustion temperature.

The EGR system has a ported EGR valve (figure 21), hose from a ported manifold vacuum source and a method to control the vacuum source.

A coolant temperature TVS is used to control the vacuum source.

OPERATION

The thermostatic vacuum switch (TVS) blocks vacuum to the EGR valve during cold engine operation (figure 22).

When the engine is warm, the TVS opens, which opens the vacuum source to the EGR valve. At idle or wide-open throttle, there is little or no vacuum from the vacuum source, the EGR pintle is closed and there is no exhaust gas recirculation. When the throttle valves are opened, vacuum is applied through the exposed vacuum signal port(s) to the vacuum diaphragm in the EGR valve through a connection tube. When the vacuum reaches a pre-determined level, the diaphragm moves upward against calibrated spring tension, pulling the pintle with it. The pintle rises off the seat, allowing exhaust gas to flow from the exhaust manifold to the intake manifold and into the engine cylinders.

Exhaust gas will be recirculated during periods of normal intake manifold vacuum, when the throttle is open beyond idle.
4. Compare vacuum gage reading(s) with the procedures and in the TVS descriptions given under each valve name.
5. Heat TVS to a temperature above the calibration temperature. Never apply a torch or open flame directly to the TVS.
6. Compare vacuum gage reading to the correct reading indicated on switch or valve base.

**NOTICE:** Leakage of up to 7 kPa (2" Hg) vacuum in 2 minutes is allowable and does not mean a defective part.

7. If operation is satisfactory, re-install valve or switch. If valve or switch is defective, replace with a new part.

**ON-VEHICLE SERVICE — EGR**

**CLEANING MANIFOLD PASSAGE**

**Inspect**

If EGR passages in the inlet manifold indicate excessive build-up of deposits, the passages should be cleaned. Care should be taken to insure that all loose particles are completely removed to prevent them from clogging the EGR valve or from being ingested into the engine.

Do not wash EGR valve in solvents or degreaser — permanent damage to valve diaphragm may result. Also, sand blasting of the valve is not recommended since this can affect the operation of the valve.

**SYSTEM HOSES**

**EARLY FUEL EVAPORATION SYSTEM (EFE)**

**ALL ENGINES EXCEPT 4.8 L**

**GENERAL DESCRIPTION**

**PURPOSE**
The EFE system used on all engines provides a source of rapid heat to the engine induction system during cold driveaway. Rapid heating is desirable because it provides quick fuel evaporation and more uniform fuel distribution to aid cold driveability. It also reduces the length of time carburetor choking is required, so it reduces exhaust emissions.

**OPERATION**
The EFE system is a Vacuum Servo type that uses a valve and vacuum actuator which increases the exhaust gas flow under the intake manifold during cold engine operation. The valve is located in the exhaust and the vacuum actuator is vacuum operated (figure 26) by a thermal vacuum switch (TVS) (figure 27). When vacuum is applied to the actuator, the valve closes, causing the intake manifold to heat up.

When coolant temperature increases, the TVS stops vacuum to the actuator.

**Results of Incorrect EFE Operation**

No EFE when cold:
- Engine may stumble and stall during warm-up.
- Engine takes longer time to warm up.
- Choke may heat up and be off before engine is warm.

EFE stays on:
- Poor performance.
- Lack of power when warm due to superheated gases.
- Engine may overheat.

**DIAGNOSIS OF EFE**

**GENERAL**
The operation of the EFE system is to be checked at regular maintenance intervals. Refer to Section OB for maintenance interval information.

**POSITIVE CRANKCASE VENTILATION (PCV)**

![PCV Valve Cross Section](image)

**GENERAL DESCRIPTION**

**PURPOSE**

A Positive Crankcase Ventilation (PCV) system is used to provide more complete scavenging of crankcase vapors.

**OPERATION**

Fresh air from the air cleaner is supplied to the crankcase, mixed with blow-by gases and then passed through a positive crankcase ventilation (PCV) valve into the intake manifold (figure 32). The primary control is through the PCV valve (figure 31) which meters the flow at a rate depending on manifold vacuum.

To maintain idle quality, the PCV valve restricts the flow when intake manifold vacuum is high. If abnormal operating conditions arise, the system is designed to allow excessive amounts of blow-by gases to back flow through the crankcase vent tube into the air cleaner to be consumed by normal combustion.

**Results of Incorrect PCV Operation**

- A plugged valve or hose may cause:
  - Rough idle.
  - Stalling or slow idle speed.
  - Oil leaks.
  - Oil in air cleaner.
  - Sludge in engine.
- A leaking valve or hose would cause:
  - Rough idle.
  - Stalling.

**DIAGNOSIS OF PCV**

If an engine is idling rough, check for a clogged PCV valve or plugged hose. Replace as required. Use the following procedure:

1. Remove PCV valve from rocker arm cover.
2. Run the engine at idle.
3. Place your thumb over end of valve to check for vacuum. If there is no vacuum at valve, check for plugged hoses or manifold port, or PCV valve. Replace plugged or deteriorated hoses.

**ON-VEHICLE SERVICE — PCV**

See figure 33 for replacement of PCV system components.

An engine which is operated without any crankcase ventilation can be damaged. Therefore, it is important to
replace the PCV valve and air cleaner breather at intervals shown in Section 0B.
Periodically, inspect the hoses and clamps and replace any showing signs of deterioration.

**THERMOSTATIC AIR CLEANER (THERMAC)**

**GENERAL DESCRIPTION**

**PURPOSE**
A heated intake air system is used to give good driveability under varying climatic conditions. By having a uniform inlet temperature, the fuel system can be calibrated to reduce exhaust emissions and to eliminate throttle blade icing.

**OPERATION**
The THERMAC air cleaner operates by heated air and manifold vacuum (figure 34). Air can enter the air cleaner from outside the engine compartment or from a heat stove built around the exhaust manifold. A vacuum diaphragm motor, built into the air cleaner snorkel, moves a damper door, to admit hot air from the exhaust manifold, outside air, or a combination of both. Inside the air cleaner is a temperature sensor that reacts to air intake temperature and controls the amount of vacuum going to the motor.

- **Hot Air Delivery Mode.** When the temperature is below 86°F (30°C), the sensor allows vacuum to the motor and the damper door will be up, shutting off outside air and allowing only heated air from the exhaust manifold to enter the air cleaner.
- **Regulating Mode.** Between 86°F (30°C) and 131°F (55°C) the damper door allows both heated and outside air to enter the air cleaner.
- **Outside Air Delivery Mode.** When the temperature is above 131°F (55°C), the damper door drops down and only outside air enters the air cleaner.

**THERMAC DELAY VALVE**
Some applications use a delay valve on the hose connecting the vacuum motor to the temperature sensor (figure 35). When vacuum in this hose drops for any reason, the check valve will bleed off the vacuum to the vacuum motor slowly.

**Results of Incorrect THERMAC Operation**
- **Hesitation during warm-up can be caused by:**
  - Heat stove tube disconnected.
  - Vacuum diaphragm motor inoperative (open to snorkel).
  - No manifold vacuum.
  - Damper door does not move.
  - Missing air cleaner to carburetor seal.
  - Missing air cleaner cover seal or loose cover.
  - Loose air cleaner.
- **Lack of power, sluggish or spongy, on a hot engine can be caused by:**
  - Damper door does not open to outside air.
  - Temperature sensor doesn't bleed off vacuum.
DIAGNOSIS OF THERMAC

THERMAC AIR CLEANER CHECK
1. Inspect system to be sure all hoses and heat stove tube are connected. Check for kinked, plugged or deteriorated hoses.
2. Check for presence and condition of air cleaner-to-carburetor gasket seal.
3. With air cleaner assembly installed, damper door should be open to outside air.
4. Start engine. Watch damper door in air cleaner snorkel. When engine is first started, damper door should move and close off outside air. As air cleaner warms up, damper door should open slowly to outside air.

5. If the air cleaner fails to operate as described above, perform vacuum motor check. If it operates, the door may not be moving at the right temperature. If the driveability problem is during warm-up, make the temperature sensor check below.

VACUUM MOTOR CHECK

1. With engine off, disconnect vacuum hose at vacuum diaphragm motor.
2. Apply at least 23 kPa (7 in. Hg) of vacuum to the vacuum diaphragm motor. Damper door should completely block off outside air when vacuum is applied. If not, check to see if linkage is hooked up correctly.
3. With vacuum still applied, trap vacuum in vacuum diaphragm motor by bending hose. Damper door should remain closed. If not, replace vacuum diaphragm motor assembly. (Failure of the vacuum diaphragm motor assembly is more likely to be caused from binding linkage or a corroded snorkel than from a failed diaphragm. This should be checked first before replacing the diaphragm.)
4. If vacuum motor checks OK, check vacuum hoses and connections. If OK, replace the temperature sensor.

TEMPERATURE SENSOR CHECK

1. Start test with air cleaner temperature below 30°C (86°F). If engine has been run recently, remove air cleaner cover and place thermometer as close as possible to the sensor. Let air cleaner cool until thermometer reads below 30°C (86°F) about 5 to 10 minutes. Reinstall air cleaner on engine and continue to Step 2.
2. Start and idle engine. Damper door should move to close off outside air immediately if engine is cool enough. When damper door starts to open the snorkel passage (in a few minutes), remove air cleaner cover and read thermometer. It must read about 55°C (131°F).
3. If the damper door is not open to outside air at temperature indicated, temperature sensor is malfunctioning and must be replaced.

THROTTLE RETURN CONTROL (TRC) SYSTEM

GENERAL DESCRIPTION

PURPOSE
The TRC system (figure 38), used on V8 heavy duty emission vehicles, consists of three major components:

- Throttle Lever Actuator — Mounted as part of the carburetor assembly, this device opens the primary throttle plates a preset amount in excess of curb idle, when engine vacuum is applied to it. This actuating vacuum is controlled by a separate solenoid vacuum control valve.

- Solenoid Vacuum Control Valve — Mounted separately from the carburetor, this off-on valve is held open, above a preset nominal engine speed, by a signal from an engine speed sensor. The valve, when open, allows a vacuum signal to be applied to the throttle lever actuator as long as the preset engine speed is exceeded.

- Engine Speed Switch — Mounted separately from the solenoid vacuum control valve, this switching device monitors engine speed at the distributor and supplies a continuous electrical signal to the solenoid vacuum control valve as long as the preset engine speed is exceeded.

DIAGNOSIS OF TRC

Check hoses for cracking, abrasion, or deterioration and replace as necessary. Check for shorted or broken wires and be sure that electrical connectors are fully engaged at the distributor, speed switch, and control valve. Check system function for proper operation and adjust as necessary.

1. Connect precision tachometer (capable of resolving 10 rpm) to the distributor “TACH” terminal.

2. Start engine and advance throttle to indicated 1890 rpm. Throttle lever actuator should be extended at this speed.

3. Reduce throttle opening to indicated 1700 rpm. Throttle lever actuator should be retracted at this speed.

4. If the throttle lever actuator operates outside of the 1700 to 1890 rpm limits, the speed switch is out of calibration and should be replaced.

5. If the actuator does not operate at any speed, proceed with the following steps.
   a. With a voltmeter, check for voltage at the control valve and speed switch. This is accomplished by connecting the negative probe of the voltmeter to the engine “ground” and inserting the positive probe in the connector cavity of the voltage source wire. A voltage of 12–14 volts should be measured at this terminal on both the valve and speed switch. When making this measurement, it is not necessary to unplug the connector from its component. The voltmeter probe can be inserted in the connector body on the wire side of the connector to contact the metal terminal.

b. If voltage is present at one device and not the other, repair the engine wiring harness as required.

c. If voltage is not present at either device, check the engine harness connections at the distributor and/or bulkhead connector. Repair as required.

d. If the proper voltage exists at each device, to check for proper solenoid valve operation, “ground” the valve-to-switch connecting wire terminal at the solenoid connector, using a jumper wire. The throttle lever actuator should extend (engine running).

e. If it does not extend, remove the hose from the solenoid side port that connects to the actuator hose. Visually, check the orifice in this port for plugging. Clear the orifice as required. If not plugged, replace the solenoid vacuum control valve.

f. If the actuator extends in Step D, ground the valve-to-switch wire terminal at the speed switch. If it does not extend, repair the wire connecting the speed switch and valve. If it does extend, check the speed switch ground wire for “ground” — it should read 0 volts when checked with a voltmeter, with the engine running, check the speed switch-to-distributor wire for proper connection. With both the ground and distributor wires properly connected, and if the actuator does not extend when operating above 1890 rpm, replace the speed switch.

THROTTLE LEVER ACTUATOR —
CHECKING PROCEDURE

1. Disconnect valve to actuator hose at valve and connect to an external vacuum source equipped with a vacuum gage.

2. Apply 68 kPa (20" Hg) vacuum to the actuator and seal off the vacuum source. If the vacuum gage reading drops, then the actuator is leaking and must be replaced.

3. To check the actuator for proper operation:
   a. Check the throttle lever, shaft, and linkage to be sure that they operate freely without binding or sticking.

   b. Start engine and run until warmed up and idle is stable. Note idle rpm.

   c. Apply 68 kPa (20" Hg) vacuum to the actuator. Manually, open the throttle slightly and allow to close against the extended actuator plunger. Note the engine rpm.

   d. Release and reapply 68 kPa (20" Hg) vacuum to the actuator and note the rpm to which the engine speed increased (do not assist the actuator).

   e. If the rpm obtained in Step D is not within 150 rpm of that obtained in Step C, then the actuator plunger may be binding due to dirt, corrosion, varnish, etc., or the actuator

diaphragm may be too weak. If binding is not indicated, or cannot be corrected, then the actuator must be replaced.
f. Release the vacuum from the actuator and the engine speed should return to within 50 rpm of the idle speed noted in Step 2. If it does not, the plunger may be binding due to dirt, corrosion, varnish, etc. If the problem cannot be corrected, the actuator must be replaced.

All new General Motors vehicles are certified by the United States Environmental Protection Agency as conforming to the requirements of the regulations for the control of air pollution from new motor vehicles. This certification is contingent on certain adjustments being set to factory standards. In most cases, these adjustment points either have been permanently sealed and/or made inaccessible to prevent indiscriminate or routine adjustment in the field. For this reason, the factory procedure for temporarily removing plugs, caps, etc., for purposes of servicing the product must be strictly followed and, wherever practicable, returned to the original intent of the design.

For vehicles sold in Canada, also refer to the appropriate Canadian Service Manual Supplement.
The 6.2L diesel engine has controls to reduce exhaust emissions while maintaining good drivability and fuel economy. The light duty emission engine (RPO LH6) has Crankcase Ventilation and Exhaust Gas Recirculation.

Figure 3—Heavy Duty Emission System
The crankcase ventilation system is used on all 6.2L diesel engines to reduce crankcase pressure at idle (figure 4). This reduced pressure reduces engine oil leaks. The system consists of connecting hoses and a Crankcase Depression Regulator (CDR) valve located at the front right cylinder head.

The CDR valve is used to regulate the flow of crankcase gases back into the engine. The valve limits vacuum in the crankcase as the gases are drawn from the oil fill pipe and into the intake manifold.

Intake manifold vacuum acts against a spring loaded diaphragm to control the flow of crankcase gases (figure 5). Higher intake vacuum pulls the diaphragm closer to the top of the outlet tube. This reduces the amount of gases being drawn from the crankcase and also decreases the vacuum in the crankcase. As the intake vacuum decreases, the spring pushes the diaphragm away from the top of the outlet tube. This allows more crankcase gases to flow to the intake manifold.

Refer to MAINTENANCE AND LUBRICATION (SEC. 0B) for diesel crankcase ventilation system maintenance requirements.

**CDR VALVE CHECK**

The purpose of the CDR valve is to maintain 0.75-1.0 kPa (3-4 inches of water) vacuum in the crankcase. Too little vacuum may force oil leaks while too much vacuum will pull oil into the air crossover.

The CDR valve is checked with a water manometer. The U-tube manometer indicates pressure or vacuum by the difference in the height of the two columns of the fluid (figure 6).

1. Connect one end of the manometer to the oil dipstick hole.
   • The other end of the manometer is vented to atmosphere.

2. Run the engine at idle.

3. The reading should be about 0.25 kPa (1-inch of water) pressure at idle to 0.5-1.25 kPa (2-5 inches of water) vacuum at full load.
   • Add the amount that the manometer column travels up to the amount the other column travels down to get the total pressure or vacuum.

As an example: 12.7 mm (one-half inch) above zero plus 12.7 mm (one-half inch) below zero gives a 25.4 (one-inch) vacuum reading (figure 6).
EXHAUST GAS RECIRCULATION SYSTEM

The Exhaust Gas Recirculation (EGR) system is used on 6.2 L diesel engines with Federal light duty emissions. The EGR system (figure 7) consists of:
- EGR valve.
- Exhaust Pressure Regulator (EPR).
- EGR solenoid.
- EPR solenoid.
- Throttle Position Switch (TPS).
- Vacuum Pump.

Nitrogen oxides (NOx) are formed at high combustion temperatures. The purpose of the EGR system is to reduce these emissions.

Exhaust gases are introduced into the intake manifold through the EGR valve (figure 8). These exhaust gases act as an inert (non-combustible) ingredient in the combustion chamber. This reduces NOx through lower combustion temperatures.

The EPR valve is located between the exhaust manifold and the exhaust pipe (figure 9). It increases exhaust backpressure during idle to increase exhaust flow through the EGR system. The EPR valve is normally open.

The TPS is mounted on the throttle shaft of the injection pump. As the throttle is opened, one switch contact opens a circuit and another switch closes a circuit at calibrated throttle angles.

At idle, the EPR solenoid is energized through the TPS, allowing vacuum to close the EPR valve. This increases exhaust backpressure. At a calibrated throttle angle, the EPR solenoid is de-energized and the EPR valve is opened.

At idle, the EGR solenoid is de-energized, allowing vacuum to open the EGR valve. At a calibrated throttle angle, the EGR solenoid is energized. This cuts off vacuum to the EGR valve and the valve closes.

The EPR solenoid is normally de-energized and the EGR solenoid is normally energized. The EPR solenoid is de-energized before, or at the same time that the EGR solenoid is energized.

There are three different cams used to change the time when the EPR valve opens and the EGR valve closes.
- Blue Cam — 0 degree difference.
- Black Cam — 5 degree difference.
- Red Cam — 10 degree difference.

Refer to figure 10 for a summary of EGR and EPR operation.
**EGR SYSTEM CHECK**

Heavy black exhaust smoke during acceleration usually indicates a problem in the system.

1. Start the engine and bring it to operating temperature.
2. Remove the air cleaner cover to observe EGR valve operation.
3. With the engine at idle, the EGR valve should be open (valve head in the up position and noticeable exhaust noise). If not, check and correct any electrical and hose connection which may be loose and/or disconnected.
4. Remove the vacuum hose from the EGR valve. The valve head should drop with a noticeable reduction in noise. Connect the hose.
5. The hose to the EGR valve should have 67.5 kPa (20-inches of Hg) vacuum at idle. If vacuum is not present, check the output of the vacuum pump at the pump. The pump should produce a minimum of 67.5 kPa (20-inches of Hg) vacuum.
6. If vacuum is present at the EGR valve, but the valve does not operate as the hose is put on and taken off, the EGR valve is stuck and should be checked and replaced if necessary.
7. Manually operate the throttle lever at the injection pump through about 15 to 20 degrees of travel. The EGR valve should close when the TPS reaches the calibrated point.
8. Check the pink wire to the TPS for 12 volts (key on). If 12 volts is not present, check for loose connections, open wires, or a blown fuse.
9. With the key on, the blue wire from the TPS should also have 12 volts. The blue wire feeds the EPR solenoid. If the pink wire has 12 volts at idle, but the blue wire does not, the TPS is inoperative and should be changed.
10. With the engine off and the key on, operate the throttle through 20 degrees of travel. At about 15 degrees, the TPS will stop sending 12 volts to the blue wire (EPR). At about 20 degrees, the TPS will supply 12 volts to the yellow wire (EGR). If not, the TPS is inoperative.
11. Make sure the electrical connections are made at the EGR/EPR solenoid assembly and that the hoses are routed correctly.

12. If there is vacuum at the solenoid assembly and the solenoids are receiving the proper electrical signal but operation of the TPS does not operate the EGR and/or EPR valve(s), the solenoid assembly is inoperative and should be replaced.

THROTTLE POSITION SWITCH ADJUSTMENT

Tool Required:
J-33043, Gage Block.

1. Disconnect the throttle position switch (TPS) connector.
2. Loosen the mounting screws that hold the TPS.
3. Connect an ohmmeter or test light to the IGN (pink) and EGR (yellow) terminals of the TPS (figure 12).
4. Insert the proper "switch closed" gage block between the gage boss on the injection pump and the wide open stop screw on the throttle shaft (figure 13).
   - Refer to the Emission Control Information label for correct gage block size.
5. Rotate the throttle lever and hold the wide open stop screw against the gage block.
6. Rotate the TPS until there is continuity between the terminals.
7. Hold the TPS and tighten the mounting screws to 6 N·m (53 in. lbs.).

Figure 12—Testing the TPS for Continuity

8. Return the throttle lever to the idle position and remove the gage block.
9. Insert the proper "switch open" gage block and rotate the throttle lever against the block. There should be no continuity. If there is continuity, repeat steps 1 through 9.
   - Refer to the Emission Control Information label for correct gage block size.
10. Remove the gage block and ohmmeter.
11. Connect the TPS connector.

Figure 13—TPS Adjustment Block
A vacuum regulator valve is used on engines with heavy duty emissions and automatic transmission. The valve regulates the vacuum signal to the vacuum modulator of a 400 automatic transmission. The valve is mounted to the injection pump and vacuum is supplied by the vacuum pump.

**VRV ADJUSTMENT**

**Tool Required:**
J-36142, Gage Block.

1. Loosen the vacuum regulator valve so it is free to rotate on the pump.
2. Attach a vacuum source of 67 ± 5 kPa (20-inches Hg. ± 1.5-inch Hg.) to the bottom vacuum port.
3. Attach a vacuum gage to the top vacuum port (figure 14).
4. Insert the proper gage block between the gage boss on the injection pump and the wide open stop screw on the throttle lever (switch on position) (figure 13).
   • Refer to the Emission Control Information label for correct gage block size.
5. Rotate the throttle shaft and hold it against the gage block.

**NOTICE: Valve must be set while rotating the valve body clockwise only.**

6. Slowly rotate the vacuum regulator valve body clockwise (facing the valve) until the vacuum gage reads 38.8 ± 2 kPa (11.5 ± 0.6 inches Hg.) Hold the valve body at this position and tighten the mounting screws to 6 N·m (54 in. lbs.).
7. Check by allowing the throttle shaft to return to the idle stop position. Then rotate the throttle shaft back against the gage block and read the vacuum gage. The gage should read 38.8 ± 2 kPa (11.5 ± 0.6 inches Hg). If vacuum is outside of limits, reset the valve.
8. With the valve vacuum set, confirm the detent switch point by reading the resistance between the ignition terminal (pink with black stripe) and the detent terminal (orange).
9. Insert J-36142 between the wide open stop pin and the wide open stop screw on the throttle lever.
10. Rotate the throttle lever against the tool. There should be no continuity (infinite resistance).
11. Release the throttle lever and remove the switch gage tool.
12. Rotate the throttle lever to wide open throttle (the lever stop screw touching the pump stop pin).
13. Check the switch for continuity. The switch must have continuity (1 to 0 ohms) before the throttle reaches the wide open throttle position. If the switch does not meet these specifications, reset the assembly by returning to step 1 and repeating the entire procedure.

DESCRIPTION

Exhaust system designs will vary according to model designation and intended use of the vehicle.

The exhaust pipe(s), muffler(s) and tailpipe(s) are standard equipment. The exhaust system uses a ball joint coupling to secure the exhaust pipe to the engine manifold. The ball joint will allow angular movement for alignment purposes. The other connections use a slip joint coupling design with a clamp and U-bolt.

The exhaust system is suspended by hangers attached to the frame members. This will permit some movement of the exhaust system, but should not permit the transfer of noise and vibration into the vehicle.

Heat shields are used to protect both the vehicle and the environment from the high temperatures developed from the exhaust system, especially the catalytic converter.

The catalytic converter is an emission control device added to the gasoline engine exhaust system to reduce hydrocarbon and carbon monoxide pollutants from the exhaust gas stream. The converter contains beads which are coated with a catalytic material containing platinum and palladium. The catalytic converter for the computer command control emission system will also contain rhodium to reduce the level of nitrogen oxides. The catalyst in the converter is not serviceable.

THE CATALYTIC CONVERTER REQUIRES THE USE OF UNLEADED FUEL ONLY.

The diesel engine does not use a catalytic converter, and uses only diesel fuel.
DIAGNOSIS OF EXHAUST SYSTEM

Exhaust system performance complaints, such as excessive back pressure, are noticeable by their effect on engine performance. However, other malfunctioning vehicle components have similar effects on engine performance and are characterized by the same symptoms or complaints. Therefore, it is necessary to refer to the engine diagnosis procedure when attempting to diagnose this type of problem.

NOTICE: Replacement of exhaust system parts MUST be OEM standard.

ON-VEHICLE SERVICE

INSPECTION

Inspect exhaust pipes, catalytic converters (if equipped), mufflers and tailpipes for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, brackets and insulators for cracks and stripped or corroded bolt threads.

The exhaust system, including heat shields, must be free of leaks, binding, grounding and excessive vibration. These conditions are usually caused by damaged or loose flange bolts, heat shields, brackets or pipes. If any of these conditions exist, check the exhaust system components and alignment. Align and replace as necessary.

INSTALLING EXHAUST PARTS

When installing a new exhaust pipe or muffler and tailpipe, on any model, check for proper alignment. Rattles and noise vibrations in the exhaust system are usually caused by misalignment of parts. When aligning the system, leave all bolts or nuts loose until all parts are properly aligned, then tighten, working from the front to the rear.

Exhaust system hangers, hanger brackets, and clamps which are damaged should be replaced to maintain exhaust system alignment.

GENERAL DESCRIPTION

The vacuum pump is mounted on diesel engines and supplies power for operating emission controls, transmission modulators, cruise control, and air conditioning controls. It may be belt driven or gear driven. Refer to “Specifications” at the end of this section for model breakdown. The pump is a diaphragm pump which does not require periodic maintenance.

BELT DRIVEN VACUUM PUMP

The belt driven model is bracket mounted at the right front of the engine. It has a pulley attached which is driven by the generator belt. With the exception of the pulley, the vacuum pump is replaced as an assembly.

GEAR DRIVEN VACUUM PUMP

The gear driven model is mounted at the top rear of the engine. It is driven by a cam inside the drive assembly to which it mounts. The drive housing assembly has a drive gear on the lower end which meshes with the camshaft gear in the engine. This drive gear causes the cam in the drive housing to rotate. The drive gear also powers the engine oil lubricating pump.

DIAGNOSIS OF VACUUM PUMP

Refer to figures 1 and 2 for diagnosis of the vacuum pump.
AUTOMATIC TRANSMISSION (VACUUM MODULATED) WILL NOT SHIFT OUT OF FIRST (LOW) GEAR. BLOCK WHEELS, APPLY PARKING BRAKE AND PLACE TRANSMISSION SELECTOR LEVER IN "PARK" OR "NEUTRAL" BEFORE STARTING ENGINE.

STEP 1

CONNECT VACUUM GAGE TO VACUUM PUMP INLET. AT ENGINE IDLE, VACUUM SHOULD REACH -70 kPa (21" Hg) MINIMUM AT SEA LEVEL WITHIN 30 SECONDS (SEE GRAPH FOR VACUUM AT OTHER ELEVATIONS).

CHECKS OKAY. LEAK IN SYSTEM OTHER THAN VACUUM PUMP

CHECKS OKAY. ANY REMAINING PROBLEMS ARE NOT WITH VACUUM SYSTEM.

LOW VACUUM — UNACCEPTABLE.

CHECK ALL ATTACHING HOSES FOR LEAKS — REPAIR AS REQUIRED.

IF STILL LOW VACUUM, CHECK ALL VACUUM ACCESSORIES FOR OUT OF SPECIFICATION LEAKS. REPAIR OR REPLACE AS REQUIRED.

TORQUE CONVERTER

The torque converter is of welded construction and is serviced as an assembly. The unit is made up of two vaned sections, or halves, that face each other in an oil filled housing. The pump half of the converter is connected to the engine and the turbine half is connected to the transmission.

When the engine makes the converter pump revolve, it sends oil against the turbine, making it revolve also. The oil then returns in a circular flow back to the converter pump, continuing this flow as long as the engine is running.

The converter also has a smaller vaned section, called a stator, that funnels oil back to the converter pump through smaller openings, at increased speed. The speeded up oil directs additional force to the engine-driven converter pump, thereby multiplying engine torque (figure 1).

TORQUE CONVERTER CLUTCH (TCC)

The converter clutch assembly consists of a 3-element torque converter with the addition of a converter clutch. The converter clutch is splined to the turbine assembly, and when operated applies against the converter cover providing a mechanical direct drive coupling of the engine to the transmission planetary gears. When the converter clutch is released, the assembly operates as a conventional torque converter (figure 1).

The Torque Converter Clutch (TCC) system uses controls that are internal as well as external to the transmission.

The internal controls are:
- TCC Solenoid Assembly — Energizes to redirect transmission fluid to the converter clutch apply valve in the auxiliary control valve assembly.
- Third Gear Switch — Closes when the transmission is in third gear to complete electrical circuit of TCC solenoid to the Electronic Control Module.

The external controls are:
- Brake Release Switch — To avoid stalling the engine when braking, the converter clutch is released any time the brakes are applied.
- Electronic Control Module — Receives input signals and grounds TCC solenoid to apply the clutch when proper operating conditions are met.
- Throttle Position Sensor — Sends throttle position information to the Electronic Control Module.
- Vacuum Sensor — Sends engine vacuum (load) information to the Electronic Control Module.
- Vehicle Speed Sensor — Sends vehicle speed information to the Electronic Control Module.
- Coolant Temperature Sensor — Sends engine coolant temperature information to the Electronic Control Module.

TRANSMISSION IDENTIFICATION

All automatic transmissions have a metal identification nameplate attached to the case exterior. The location of this name plate is shown in figure 2. The information on the nameplate will assist in the servicing and determination of replacement parts when ordered through a GM Parts Catalog.

Additional transmission identification is provided on the Service Parts Identification Label. This label contains information on the regular production options (RPO) as well as standard and mandatory options. This label is affixed to the inside of each vehicle at the assembly plant. Refer to Section 0A of this Service Manual for label location and information.
Figure 2—Transmission Identification
THM 400 (RPO M 40)

The THM 400 is a fully automatic transmission for rear wheel drive vehicles which provides three forward gear ranges and a reverse (figure 3).

The major components of this transmission are:
- Torque Converter.
- Gear Type Oil Pump.
- Two Bands.
- Three Multiple Disc Clutches.
- Two Planetary Gear Sets.
- Two Roller Clutches.
- Valve Body Assembly.

External control connections to the transmission are:
- Manual Linkage — To select the desired operating range.
- Engine Vacuum — To operate the vacuum modulator.
- 12 Volt Electrical Signals — To operate an electrical detent solenoid.

THM 700-R4 (RPO MD8)

The THM 700-R4 is a fully automatic transmission for rear wheel drive vehicles which provides four forward gear ranges and a reverse (figure 4).

The major components of this transmission are:
- Clutch Type Torque Converter.
- Vane Type Oil Pump.
- 2-4 Band Assembly.
- Five Multiple Disc Clutches.
- Two Planetary Gear Sets.
- One Sprag Clutch.
- One Roller Clutch.
- Valve Body Assembly.

External control connections to the transmission are:
- Manual Linkage — To select the desired operating range.
- Throttle Valve (TV) Cable — To control shift points by throttle opening.

TRANSMISSION DIAGNOSIS

TRANSMISSION DEFINITIONS

The following definitions are being provided to establish a common language and assist the user in describing transmission related conditions. Some of these terms or conditions are used in the transmission sections of this Service Manual.

Throttle Positions

• Minimum Throttle — the least amount of throttle opening required for an upshift.
• Light Throttle — approximately 1/4 of accelerator pedal travel.
• Medium Throttle — approximately 1/2 of accelerator pedal travel.
• Heavy Throttle — approximately 3/4 of the accelerator pedal travel.
• Wide Open Throttle (WOT) — full travel of the accelerator pedal.
• Full Throttle Detent Downshift — a quick apply of the accelerator pedal to its full travel, forcing a downshift.
• Zero Throttle Coastdown — a full release of the accelerator pedal while the vehicle is in motion and in drive range.
• Engine Braking — a condition where the engine is used to slow the vehicle by manually downshifting during a zero throttle coastdown.

Shift Conditions

• Bump — a sudden and forceful apply of a clutch or band.
• Chuggle — a bucking or jerking condition that may be engine related. May be most noticeable when the converter clutch is engaged. Similar to the feel of towing a trailer.
• Delayed — a condition where a shift is expected but does not occur for a period of time. Samples of this condition could be described as clutch or band engagement does not occur as quickly as expected during a part throttle or wide open throttle apply of the accelerator or, when manually downshifting to a lower range.
  Also defined as "LATE" or, "EXTENDED."
• Double Bump ("Double Feel") — two sudden and forceful applies of a clutch or band.
• Early — a condition where the shift occurs before the vehicle has reached a proper speed and tends to labor the engine after the upshift.
• End Bump — a firmer feel at the end of a shift as compared to the feel at the start of the shift. Also defined as "END FEEL" or, "SLIP BUMP."
• Firm — a noticeable quick apply of a clutch or band that is considered normal with a medium to heavy throttle shift. Should not be confused with "HARSH" or "ROUGH."
• Flare — a quick increase in engine rpm accompanied with a momentary loss of torque. This most generally occurs during a shift. Also defined as "SLIPPING."
• Hard ("Rough") — a more noticeable apply of a clutch or band as compared to "FIRM." This condition is considered undesirable at any throttle position.

• Hunting — a repeating quick series of upshifts and downshifts that causes a noticeable change in engine rpm. An example could be described as a 4-3-4 shift pattern. Also defined as "BUSINESS."
• Initial Feel — a distinct firmer feel at that start of a shift as compared to the finish of the shift.
• Late — a shift that occurs when the engine is at a higher than normal rpm for a given amount of throttle.
• Shudder — a repeating jerking sensation similar to "CHUGGLE" but more severe and rapid in nature. This condition may be most noticeable during certain ranges of vehicle speed. May also be used to define the condition after converter clutch engagement.
• Slipping — a noticeable increase in engine rpm without a vehicle speed increase. A slip usually occurs during or after initial clutch or band engagement.
• Soft — a slow, almost unnoticeable clutch apply with very little shift feel.
• Surge — a repeating engine related feeling of acceleration and deceleration that is less intense than "CHUGGLE."
• Tie-Up — a condition where two opposing clutches are attempting to apply at the same time causing the engine to labor with a noticeable loss of engine rpm.

Noise Conditions

• Gear Noise — a whine, most noticeable in first gear and reverse that is related to vehicle speed. A gear noise condition may become less noticeable or go away after an upshift.
• Pump Noise — a high pitch whine that increases in intensity with engine rpm. This condition may also be noticeable in PARK and NEUTRAL operating ranges with the vehicle stationary.

PRELIMINARY CHECKING PROCEDURE

This condition of an automatic transmission not operating properly may be influenced by one, or a combination of the following items:

• Fluid level high/low.
• Engine performance.
• T.V. cable adjustment.
• Manual linkage adjustment.
• Internal fluid leaks.
• Electrical system.
• Transmission or other mechanical component.
• Vacuum modulator.

TRANSMISSION FLUID INFORMATION

Checking fluid level, color and condition at regular intervals will provide early diagnosis information about the transmission. This information may then be used to correct a condition that, if not corrected early, could result in major transmission repairs.
When adding or changing fluid, use only DEXRON® II, or equivalent. Refer to Section OB of this Service Manual for maintenance information and servicing intervals.

- Fluid level should be checked when it reaches normal operating temperatures of 88-93°C (190-200°F). This temperature is reached after approximately 24 km (15 miles) of highway driving (figure 5).
- Fluid color:
  - Should be dark red (may be dark green) (figure 5).
- Inaccurate fluid level readings will result if checked immediately after the vehicle has been operated:
  - In high ambient temperatures above 32°C (90 °F).
  - At sustained high speeds.
  - In heavy city traffic during hot weather.
  - As a towing vehicle.
  - In commercial service (taxi or police use).

NOISE AND VIBRATION

A noise or vibration that is noticeable when the vehicle is in motion, MAY NOT be the result of the transmission. If noise or vibration is noticeable in “Park” (P) and “Neutral” (N) with engine at idle, but is less noticeable as RPM's increase, the cause may be from poor engine performance.

Inspect

- Tires for
  - Uneven wear.
  - Imbalance.
  - Mixed sizes.
  - Mixed radial and bias ply.
- Suspension components for
  - Alignment and wear.
  - Loose fasteners.
- Engine/Transmission mounts for
  - Damage.
  - Loose bolts.
- Transmission case mounting holes for:
  - Missing bolts, nuts, studs.
  - Stripped threads.
  - Cracks.
- Flexplate for:
  - Missing or loose bolts.
  - Cracks.
  - Imbalance.
- Torque converter for:
  - Missing or loose bolts or lugs.
  - Missing or loose balance weights.
  - Imbalance.

VIBRATION TEST PROCEDURE

1. Start the engine.
2. With the engine at idle speed and the transmission in “Park” (P) or “Neutral” (N), observe the vibration.
3. Shut off the engine.

Inspect

- Converter shield attaching bolts.
- Flexplate to torque converter attaching bolts.

- Rotate torque converter 120° (1/3 turn).
- Flexplate to torque converter attaching bolts.

Tighten

- Bolts to 42 N·m (31 ft. lbs.).
- Converter shield bolts.

Tighten

- Bolts to 13 N·m (10 ft. lbs.)

4. Start the engine and check for vibration. Repeat this procedure until the best possible balance is obtained.

Important

- Some engine/transmission combinations cannot be balanced in this manner due to limited clearances between the torque converter bolts and engine. Be sure bolts do not bottom out in lug nuts or the torque converter coverter could be dented and cause internal damage.

FLUID LEAKS

The cause of most external leaks can generally be located and repaired with the transmission in the vehicle.

METHODS FOR LOCATING LEAKS

General Method

1. Verify that the leak is transmission fluid.
2. Thoroughly clean the suspected leak area.
3. Operate the vehicle for about 15 miles or until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut off the engine and look for fluid spots on the paper.
6. Make the necessary repairs.

Powder Method

1. Thoroughly clean the suspected leak area with solvent.
2. Apply an aerosol type powder (foot powder) to the suspected leak area.
3. Operate the vehicle for about 15 miles or until normal operating temperatures are reached.
4. Shut off the engine.
5. Inspect the suspected leak area and trace the leak path through the powder to find the source.
6. Make necessary repairs.

Dye And Black Light Method

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow the manufacturer’s recommendations for the amount of dye to be used.
2. Detect the leak with the black light.
3. Correct cause of leak.

REPAIRING THE LEAK

Once the leak has been pinpointed and traced back to its source, the cause of the leak must be determined in order for it to be repaired properly. If a gasket is replaced, but the sealing flange is bent, the new gasket will not repair the leak. The bent flange must be repaired also.

**Figure 5—Checking Fluid Level, Color and Condition**
Before attempting to repair a leak, check to be sure that the following conditions are correct as they may cause a leak.

**Gaskets**
1. Fluid level/pressure is too high.
2. Plugged vent or drain-back holes.
3. Improperly torqued fasteners or dirty/damaged threads.
4. Warped flanges or sealing surface.
5. Scratches, burrs or other damage to the sealing surface.
6. Damaged or worn gasket.
7. Cracking or porosity of the component.
8. Improper sealant used (where applicable).

**Seals**
1. Fluid level/pressure is too high.
2. Plugged vent or drain-back holes.
3. Damaged seal bore (scratched, burred or nicked).
4. Damage or worn seal.
5. Improper installation.
6. Cracks in component.
7. Manual or output shaft surface scratched, nicked or damaged.
8. Loose or worn bearing causing excess seal wear.

**POSSIBLE POINTS OF FLUID LEAKS (Figure 6)**
1. Transmission oil pan or side cover:
   - Attaching bolts not correctly torqued.
   - Improperly installed or damaged gasket.
   - Oil pan or mounting face not flat.
2. Case leak:
   - Filler pipe "multi-lip seal" damaged or missing.
   - Filler pipe bracket mislocated.
   - T.V. cable "multi-lip" seal missing, damaged or improperly installed.
   - Governor cover or gasket damaged or missing.
   - Speedometer driven gear/speed sensor seal damaged.
   - Manual shaft seal damaged.
   - Oil cooler connector fittings loose or damaged.
   - Parking pawl shaft cup plug loose (if equipped).
   - Line pressure pipe plug loose.
   - Porous casting.
3. Leak at converter end:
   - Converter seal damaged.
     - Seal lip cut. (Check converter hub for damage).
     - Bushing moved forward and damaged.
     - Garter spring missing from seal.
   - Converter leak in weld area. (Refer to Torque Converter.)
   - Porous casting (case, pump).
4. Fluid comes out the vent pipe or fill tube:
   - Over-filled.
   - Water or coolant in fluid. Fluid will appear milky.
   - Case porous.
   - Incorrect fluid level indicator.
   - Plugged vent.
   - Drain back holes plugged.
   - Mispositioned oil pump to case gasket (if equipped).

**CASE POROSITY REPAIR**
1. Clean the leak area with solvent and air dry.

**CAUTION:** Epoxy cement may cause skin irritations and eye damage. Read and follow all information on the container label as provided by the manufacturer.

2. Mix a sufficient amount of epoxy cement, GM 1360016, or equivalent, following the manufacturer’s recommendations.
3. While the transmission case is hot, apply the epoxy cement with a clean, dry soldering acid brush.
4. Allow the epoxy cement to cure for three hours before starting the engine.
5. Repeat the fluid leak diagnosis procedures.

**VACUUM MODULATOR**
A vacuum modulator can cause one or more of the following complaints.
1. Harsh upshifts and downshifts.
2. Delayed upshifts.
4. Slips in low, drive and reverse.
5. Transmission overheating.
6. Engine burning transmission oil.

If any one of the above complaints are encountered, the modulator must be checked.

**CAUSES OF IMPROPER VACUUM AT MODULATOR**
1. Engine.
   a. Tune up.
   b. Loose vacuum fittings or improperly routed hoses/lines.
   c. Vacuum operated accessory leak (hoses, vacuum valve, etc.).
   d. Engine exhaust system restricted.
   e. Diesel—Vacuum Regulator Valve adjustment. (Refer to DIESEL FUEL INJECTION, SEC. 6C6).
2. Vacuum line to the modulator.
   a. Leak.
   b. Loose fitting.
   c. Restricted orifice or incorrect orifice size.
   d. Carbon build up at modulator vacuum fitting.
   e. Pinched line.
   f. Grease in pipe (delayed or no upshift-cold).

**VACUUM DIAPHRAGM CHECK**
1. Raise the vehicle and disconnect the vacuum line at the modulator.
2. Turn the modulator so the vacuum line stem points downward.
3. If transmission oil comes out, the modulator must be replaced.
4. If gasoline and/or water vapor are found in a vehicle which may be exposed to -12°C (10°F) temperatures or below, the modulator must be changed.
5. If oil is not found in the vacuum side of the modulator, but the transmission oil level is continually low, and no external leaks are found, there is a possibility that a pin hole leak exists in the diaphragm and the modulator should be replaced.

LOAD CHECK
1. Install a modulator that is known to be good on either end of tool J-24466.
2. Install the modulator in question on the opposite end of the gage (figure 7).
3. Holding the modulators in a horizontal position, bring them slowly together under pressure. If the modulator in question is bad, the gage line will remain blue. If the modulator is good, the gage line will be white. When making the comparison, make sure that both modulators are of the same type. The part numbers are stamped on the dome of the modulator.

SLEEVE ALIGNMENT CHECK
1. Roll the main body of the modulator on a flat surface.
2. If the sleeve is not concentric to the can, replace the modulator.
3. If the plunger is not free, replace the modulator.
The following items should also be checked as a possible cause of the problem.
1. Check freeness of modulator valve in transmission case.
2. Check the vacuum line from the manifold or vacuum pump to modulator for holes, cracks or dents. Check the rubber hose connection at the modulator and at the intake manifold or vacuum pump for leaks.

ATMOSPHERIC LEAK CHECK
1. Apply a thick coating of soap bubble solution to the vacuum connector pipe seam and the crimped upper to lower housing seam.
2. Using a short piece of rubber hose, apply air pressure to the vacuum pipe by blowing into the tube.
3. If bubbles appear, replace the modulator.
   Do not use any method other than human lung power for applying air pressure, as pressures over 41.37 kPa (6 psi) may damage the modulator.

### STATOR ASSEMBLY FREEWHEELS

If the stator roller clutch becomes ineffective, the stator assembly freewheels at all times in both directions. With this condition, the vehicle tends to have poor acceleration from a standstill. At speeds above 48 to 56 km/h (30-35 mph), the vehicle may act normal. If poor acceleration problems are noted, it should first be determined that the exhaust system is not blocked, the engine is running properly and the transmission is in first (1st) gear when starting out.

If the engine will free accelerate to high rpm in Neutral (N), it can be assumed that the engine and exhaust system are normal.

### STATOR ASSEMBLY REMAINS LOCKED UP

If the stator assembly remains locked up at all times, the engine rpm and vehicle speed will tend to be limited or restricted at high speeds. The vehicle performance when accelerating from a standstill will be normal. Engine overheating may be noted. Visual examination of the converter may reveal a blue color from the overheating that will result.

### DIAGNOSIS OF TORQUE CONVERTER CLUTCH (TCC)

To properly diagnose the Torque Converter Clutch (TCC) system perform all electrical testing first and then the hydraulic testing.
TORQUE CONVERTER CLUTCH (T.C.C.)
ELECTRICAL DIAGNOSIS

MECHANICAL CHECKS, SUCH AS LINKAGE, OIL LEVEL, ETC., SHOULD BE PERFORMED PRIOR TO USING THIS CHART.

- Connect test light from TCC test point in fuse block to ground.
- Start engine and run at 1500 RPM in Park.
- Note light.

**LIGHT ON**

Hold throttle position. Test light should go out as brake pedal is momentarily depressed.

- **NOT OK**
  - It is faulty brake switch or adj.
  - **OK**

**LIGHT OFF**

Check for blown fuse.
- Check operation of brake switch.
- Check operation of low vacuum switch. Switch open—With engine off.
  - Switch closed—at idle & part throttle.
  - Switch open—at heavy full throttle.
- Check for opens in harness.
- Check operation of V.R.V. closed—at idle and part throttle.
  - Open—at heavy full throttle

Disconnect test light from ground & connect to 12 volt source at fuse block & note light with engine not running.

- **LIGHT OFF**
  - With drive wheels off floor, run engine with transmission in gear at 50-55 MPH. Momentarily depress brake pedal & note test light.
- **LIGHT ON**
  - Internal transmission wiring and/or switches and/or solenoid grounded.

- **LIGHT OFF**
  - Open in internal transmission circuitry.
  - Check wiring, solenoid & governor pressure switch.
- **LIGHT ON**
  - Electrical function okay.
  - Check mechanical function of solenoid & TCC valve.

* IF HIGH LINE PRESSURES ARE EXPERIENCED, REFER TO "CAUSES OF HIGH LINE PRESSURE" IN THIS SECTION.

** VEHICLE ON HOIST, DRIVING WHEELS OFF GROUND, SELECTOR IN DRIVE, BRAKES RELEASED, RAISE ENGINE TO 3000 R.P.M., CLOSE THROTTLE AND READ PRESSURE BETWEEN 2000 AND 1200 R.P.M.
ROAD TEST

1. Connect a portable tachometer to the engine. Engine rpm will identify the shift points.

2. Place the selector in “Drive” position and accelerate the vehicle from a rest at a minimum throttle opening.

   The specifications for the shifts points are:

   - Downshifts should occur (3-2 and 2-1) as the vehicle speed decreases to 0 mph. Stop the vehicle.

3. Place the selector in “Intermediate” position and accelerate the vehicle from a rest. A 1-2 shift should occur at all throttle openings. No 2-3 shift can be obtained in this range. Stop the vehicle.

4. Place the selector in “Low”. No upshift should occur in this range regardless of the throttle opening.

5. Position the selector in “Drive” and accelerate the vehicle to 35 mph and move the selector to “Intermediate”. A 3-2 downshift should occur, increasing the engine rpm and an engine braking effect should be noticed on deceleration.

6. With the selector in “Intermediate” at approximately 25 mph, but not over 40 mph, at closed throttle, move the selector to “Low.” A 2-1 downshift should occur, increasing the engine rpm and an engine braking effect should be noticed on deceleration. Stop the vehicle.

7. Place the selector in “Reverse” and check for reverse operation.

CAUSES OF LOW LINE PRESSURE

1. Low transmission oil level.
2. Modulator Assembly.
3. Filter.
   - Blocked or restricted. (There is no approved service procedure for checking or cleaning the filter. If the filter is suspected or being plugged or restricted, it must be replaced).
   - Seal on intake pipe and/or grommet omitted or damaged.
   - Split or leaking intake pipe.
   - Wrong filter assembly.

4. Pump.
   - Pressure regulator or boost valve stuck.
   - Gear clearance, damaged, worn. (Pump will become damaged if drive gear is installed backwards, or if converter pilot does not enter crankshaft freely).
   - Pressure regulator spring, too week.
   - Not enough spacers in pressure regulator.
   - Pump to case gasket mispositioned.
   - Malfunctioning pump body and/or cover.
   - Mismatched pump cover/pump body.

5. Internal circuit leaks.
   - Forward clutch leak (pressure normal in neutral and reverse-pressure low in drive).
     - Check pump rings.
     - Check forward clutch seals.
   - Direct clutch leak (pressure normal in neutral, low, intermediate, and drive—pressure low in reverse).
     - Check center support oil seal rings.
     - Check direct clutch outer seal for damage.
     - Check rear servo and front accumulator pistons and rings for damage or missing.

6. Case assembly.
   - Porosity in intake bore area.
   - Check case for intermediate clutch plug leak or missing plug.
   - Lo-reverse check ball mispositioned or missing (this will cause no reverse and no overrun braking in Lo range).

CAUSES OF HIGH LINE PRESSURE

1. Vacuum leak.
   - Full leak (vacuum line disconnected).
   - Partial leak in the line from the engine modulator.
   - Improper engine vacuum.
   - Vacuum operated accessory leak. (Hoses, vacuum advance, etc.).

2. Damaged modulator.
   - Stuck valve.
   - Water in the modulator.
   - Not operating properly.

3. Detent system.
   - Detent switch actuated (plunger stuck) or shorted.
   - Detent wiring shorted.
   - Detent solenoid stuck open.
   - Detent feed orifice in the spacer plate blocked.
   - Detent solenoid loose.

1. Install an oil pressure test gage.
2. Install a tachometer.
3. Disconnect the vacuum line to the modulator.
4. With the vehicle on a hoist driving wheels off the ground, foot off the brake, in drive, check the line pressure at 1000 rpm.
5. Slowly increase the engine rpm to 3000 rpm and determine if a line pressure drop occurs (69 kPa [10 psi] or more).
6. If pressure drop of 69 kPa (10 psi) or more occurs, disassemble, clean and inspect the control valve assembly.

THM 700-R4 PRELIMINARY CHECKING

- CHECK TRANSMISSION OIL LEVEL
- CHECK AND ADJUST T V CABLE
- CHECK OUTSIDE MANUAL LINKAGE AND CORRECT
- CHECK ENGINE TUNE
- INSTALL OIL PRESSURE GAGE (FIGURE 57)
- CONNECT TACHOMETER TO ENGINE
- CHECK OIL PRESSURE AS FOLLOWS:

**NOTICE** Total running time for this combination not to exceed 2 minutes.

**CAUTION** Brakes must be applied at all times.

Minimum T V Line Pressure Check
Set the T V cable to specification; and with the brakes applied, take the line pressure readings in the ranges and at the engine r.p.m.'s indicated in the chart below.

Full T V Line Pressure Check
Full T V line pressure readings are obtained by tying or holding the T V cable to the full extent of its travel; and with the brakes applied, take the line pressure readings in the ranges and at the engine r.p.m.'s indicated in the chart below.

Line pressure is basically controlled by pump output and the pressure regulator valve. In addition, line pressure is boosted in Reverse, Second and Lo by the reverse boost valve.

Also, in the Neutral, Drive, Intermediate and Reverse positions of the selector lever, the line pressure should increase with throttle opening because of the T V system. The pressure is controlled by the T V cable, the throttle lever and bracket assembly and the T V link, as well as the control valve assembly.

The main line pressure tap plug is located on the left side of the transmission above the outside manual lever.

Figure 35—Oil Pressure Check Procedure
IMPORTANT

As a diagnosis aid, you can check the oil pressure differential between line pressure and the 2nd, 3rd, and 4th clutch pressure while driving the vehicle. If the pressure differential between line pressure and any of the clutch circuits is more than 70 kPa (10 psi) (provided your gages are accurate), there is a possible leak in that clutch oil circuit.

B. Third Pressure
C. Fourth Pressure
D. Second Pressure
ROAD TEST

- Perform the road test following the sequence given.
- KPH (MPH) shift points will vary with actual throttle position and driver habits.
- Compare the results of the test with speed shift chart information. Use these results with the diagnosis information to evaluate the transmission (figure 37).
- This test should only be performed when traffic and road conditions permit.
- Observe all traffic safety regulations.

GARAGE SHIFT CHECK
1. Start engine.
2. Depress brake pedal.
3. Move gear selector:
   - "Park" (P) to "Reverse" (R).
   - "Reverse" (R) to "Neutral" (N) to "Drive" (D).
   Gear selections should be immediate and not harsh.

UPSHIFTS AND TORQUE CONVERTER CLUTCH (TCC) APPLY
With gear selector in "Overdrive" (D).
1. Accelerate using a steady increasing throttle pressure.
2. Note the shift speed point gear engagements for:
   - 2nd gear.
   - 3rd gear.
   - Overdrive.
3. Note the speed shift point to TCC apply. This should occur while in third gear or overdrive. If the apply is not noticed, refer to the Preliminary Torque Converter Clutch Diagnosis information contained in this section of the Service Manual.

Important
- The torque converter clutch will not engage if engine coolant has not reached a minimum operating temperature of approximately 54°C (130°F).

PART THROTTLE DETENT DOWNSHIFT
At vehicle speeds of 40-55 MPH (64-88 KPH) quickly depress the accelerator to a half open position and observe:
- TCC releases.
- Transmission downshift to 3rd gear immediately.

FULL THROTTLE DETENT DOWNSHIFT
At vehicle speeds of 40-55 MPH (64-88 KPH) quickly depress the accelerator to a wide open position and observe:
- TCC releases.
- Transmission downshifts to 3rd gear immediately.

MANUAL DOWNSHIFT
1. At vehicle speeds of 40-55 MPH (64 to 88 KPH) release the accelerator pedal while moving the gear selector to "Third" (D) and observe:
   - TCC release.
   - Transmission downshift to 3rd gear should be immediate.
   - Engine should slow vehicle down.
2. Move gear selector to "Overdrive (D) and accelerate to 40-45 MPH (64-72 KPH). Release the accelerator pedal while moving the gear selector to "Second" (2) and observe:
   - TCC release.
   - Downshift to second gear should be immediate.
   - Engine should slow vehicle down.
3. Move gear selector to "Overdrive" (D) and accelerate to 25 MPH (40 KPH). Release the accelerator pedal while moving the gear selector to "First" (1) and observe:
   - TCC release.
   - Transmission downshift to 1st gear should be immediate.
   - Engine should slow vehicle down.

COASTDOWN DOWNSHIFT
1. With the gear selector in "Overdrive" (D) accelerate to 4th gear with TCC applied.
2. Release the accelerator pedal and lightly apply the brake to observe:
   - TCC release.
   - Shift points for downshifts.

MANUAL GEAR RANGE SELECTION

MANUAL THIRD (D)
1. With vehicle stopped, place gear selector in "Third" (D) and accelerate to observe:
   - The first to second gear shift point.
   - The second to third gear shift point.

MANUAL SECOND (2)
1. With vehicle stopped, place gear selector in "Second" (2) and accelerate to observe:
   - The first to second gear shift point.
2. Accelerate to 25 MPH (40 KPH) and observe:
   - That a second to third gear shift does not occur.
   - That TCC does not engage.

MANUAL FIRST (1)
1. With vehicle stopped, place gear selector in "First" (1) and accelerate to 15 MPH (24 KPH) and observe:
   - That no upshift occurs.
   - That TCC does not engage.

REVERSE
1. With vehicle stopped, place gear selector in "Reverse" (R) and slowly accelerate to observe reverse gear operation.
All possible throttle positions and corresponding MPH shift point information has not been provided.

ON VEHICLE SERVICE

PARTS CLEANING, INSPECTION AND REPLACEMENT

1. Use appropriate safety equipment such as:
   • Safety glasses.
   • Safety shoes.
   • Gloves.
2. Keep work area and tools clean.
3. Clean the transmission exterior before removing parts.
4. Do not use wipe cloths or rags.
5. Do not use solvents on:
   • Rubber seals.
   • Plastic/Teflon® thrust washers.
6. Blow out all passages with compressed air.
7. Clean out small passages with fine wire.
8. Handle parts carefully to prevent damage.
9. Lubricate all internal parts with transmission fluid during assembly.
10. When installing screws, bolts or studs into aluminum always dip the threads in transmission fluid.
11. Always use a torque wrench for proper torque.
12. Recondition damaged or stripped aluminum threads with thread inserts.
13. Replace all gaskets and seals.
   • Do not use gasket cement or sealers.
14. Replace Teflon® and rubber lip seals only when necessary and install them using the appropriate seal protector.

Inspect

1. Manual linkage for:
   • Wear at pivoting points.
   • Bent or broken links and rods.
2. All seals, gasket and mating surfaces for:
   • Nicks.
   • Cuts.
   • Damage.
3. Snap rings for:
   • Expansion or compression.
   • Distortion.
   • Nicks.
   • Proper ring to groove fit.
4. Bearings and thrust surfaces for:
   • Wear.
   • Scoring.
   • Pitting.

OIL COOLER LINES

If replacement of transmission steel tubing cooler lines is required, use only double wrapped and brazed steel tubing meeting GM specification 123M or equivalent. Under no condition use copper or aluminum tubing to replace steel tubing. Those materials do not have satisfactory fatigue durability to withstand normal vehicle vibrations. Steel tubing should be flared using the double flare method.

COOLER LINE FLUSHING

In a major transmission failure, where particles of metal have been carried with the oil throughout the units of the transmission, it will be necessary to flush out the oil cooler and connecting lines. To flush the oil cooler and lines, use the following procedure:

1. Disconnect both cooler lines from the transmission.
2. Place a hose over the end of the cooler inlet line (from the bottom of the cooler) and insert the hose into an empty container.
3. Flush clean oleum solvent or equivalent through the return line (from the top of the cooler) using an oil suction gun until clean solvent comes out of the hose. This will “back flush” the cooler.
4. Remove the hose from the inlet cooler line and place it on the return line.
5. Flush clean oleum solvent or equivalent through the inlet line until clean solvent comes out the return line. Remove remaining solvent from cooler with compressed air applied to the return line and flush with transmission fluid.
6. Reconnect oil cooler lines and torque nuts to 17 N·m (12 ft. lbs.).

CHECKING AND ADDING FLUID

The automatic transmission is designed to operate at the “FULL HOT” mark on the dipstick at normal operating temperatures of 88°C–93°C (190°F–200°F), and should be checked under these conditions (figure 61).

The normal operating temperature is obtained only after at least 24 km (15 miles) of highway type driving.

If the vehicle has recently been operated for an extended period at high speed or in city traffic in hot weather or the vehicle is being used to pull a trailer, an accurate fluid level cannot be determined until the fluid has cooled down, usually about 30 minutes after the vehicle has been parked.

A. Operating Level

Figure 61—Transmission Dipstick

Inspect
1. Park vehicle on level ground.
2. Apply parking brake and block wheels.
3. Start engine and operate vehicle for 15 minutes or until a normal operating temperature is reached.
4. Move gear selector through all gear positions.
5. Move gear selector to “Park” (P).
6. Check fluid level, color and condition. Refer to “Transmission Fluid Information” in this section.

Important
DO NOT OVERFILL.
Overfilling can cause foaming and loss of fluid through the vent. Slippage and transmission failure can result. Fluid level too low can cause slipping, particularly, when the transmission is cold or the vehicle is on a hill.

SHIFT LINKAGE

Remove or Disconnect (Figure 62)

1. Apply the parking brake.
2. Retaining pin (226).
3. Rod (240) from the column lever.
4. Screw (242) and the washer.
5. Swivel (232).
6. Insulator, washer and the spring.
7. Nut (236), washers and the insulator.
8. Swivel (232).
9. Spacer and the retainer.
10. Retaining pin (227) and the equalizer lever (238).

Clean

Metal parts using solvent. Wipe dry using a clean, dry rag.
Rubber or nylon parts using soapy water. Wipe dry using a clean, dry rag.

Install or Connect (Figure 62)

1. Equalizer lever (238) and a new retaining pin (227).
2. Spring, washer and the insulator.
2. Rod (240) to the equalizer lever (238)
   - R. V and P Models
     - Swivel (232)
     - Washer and the screw (242)
   - G Models
     - Retainer and the spacer
     - Swivel (232)
     - Insulator, washers and the nut (236).

3. Rod (240) to the column lever:
   - Insulators, spacers and washers in the positions
     they were removed from.

4. New retaining pin (226).

**Adjust**

- Apply the parking brake.

1. Loosen the screw (242) or the nut (236), as used.

2. Put the column selector lever in the "N" (Neutral) position.
   - Put the lever into the neutral gate, do not use the
     indicator to find the neutral position.

3. Put the transmission in neutral.

- Move the shift lever (A) to the forward position,
  the back to the second detent. (Figure 63).

4. Hold the rod (240) tightly in the swivel (232).

**Tighten**

- Nut (236) or the screw (242), to 23 N·m (17 ft. lb.).

5. Put the column selector lever in the "P" (Park) position.

6. Check the adjustment.

- The column selector lever must go into all
  positions

- The engine must start in the "P" (Park) or "N"
  (Neutral) positions only. Adjust if needed, refer to
  "Neutral Start Switch" in this section.

**CAUTION:** With the selector lever in the "Park"
position, the parking pawl should freely engage
within the rear (reaction) internal gear lugs or
output ring gear lugs and prevent the vehicle
from rolling, which could cause personal injury.
TV CABLE

The TV Cable used with the THM 700-R4 transmission should not be thought of as an automatic downshift cable. The TV cable used on the THM 700-R4 controls line pressure, shift points, shift feel, part throttle downshifts and detent downshifts. The function of the cable is similar to the combined functions of a vacuum modulator and a detent cable.

The TV cable operated the TV link (144) and bracket in the transmission (figure 64).

The TV bracket assembly serves two (2) basic functions:

1. The primary function of this assembly is to transfer the carburetor throttle plate movement to the TV plunger in the control valve assembly as related by the TV cable and linkage. This causes TV pressure and line pressure to increase according to engine throttle opening and also controls part throttle and detent downshifts. The proper adjustment of the TV cable is based on the TV plunger being fully depressed to flush with the TV bushing at engine wide open throttle.

2. The second function of the assembly involves a TV exhaust ball. The function of this system is to prevent the transmission from operating at low (idle position) pressures, if the TV cable should become broken or disconnected. If the cable is not connected or broken, the TV lifter rod will not move from its normal spring loaded up position which holds the TV exhaust check ball off its seat. The TV lifter rod will drop down to allow the TV exhaust ball to seat only if the cable is broken, disconnected or extremely out of adjustment. With the transmission pan removed, it should be possible to pull down on the TV exhaust valve lifter rod and the springs should return the rod to its normal up position. If the throttle lever and bracket assembly or lifter rod binds or sticks so that the TV lifter rod cannot lift the exhaust ball off its seat, high line pressures and delayed shifts will result.

TV CABLE ADJUSTMENT

Adjustment of the TV cable must be made by rotating the throttle lever at the carburetor or throttle body. Do not use the accelerator pedal to rotate the throttle lever.

Adjust (Figure 64)

1. Stop the engine.
2. Depress and hold down the metal re-adjust tab (250) at the engine end of the TV cable (142).
3. Move the slider (251) until it stops against the fitting.
4. Release the re-adjustment tab (250).
5. Rotate the throttle lever (140) to its "full travel position."

6. The slider (251) must move (ratchet) toward the lever when the lever is rotated to its "full travel position."
   - Check that cable moves freely. The cable may appear to function properly with the engine stopped and cold. Recheck after the engine is hot.
7. Road test the vehicle.
CHANGING THE FLUID AND FILTER

Remove or Disconnect (Figure 65)

- Raise the vehicle and support it using suitable safety stands.
- Place a drain pan under transmission oil pan.

1. Oil pan screws (222) from the front and sides only.
   - Loosen the rear oil pan screws approximately 4 turns.

NOTICE: Do not damage the transmission case or oil pan sealing surfaces.

2. Lightly tap the oil pan (221) with a rubber mallet or pry down to allow the fluid to drain.
   - Inspect the fluid color, refer to "Transmission Fluid Information" in this section.

3. Remaining oil pan screws (222), oil pan and the gasket (220).

4. Oil filter (189) and the seal (223).
   - The seal may be stuck in the case.

Clean

- Transmission case and oil pan gasket surfaces with solvent and air dry.
  - All traces of old gasket material must be removed.
AUTOMATIC TRANSMISSION 7A-67

- Install or Connect (Figure 65)
  
  1. Coat a new seal (223) with a small amount of petrolatum.
  2. New seal (223) onto a new filter (189).
  3. New filter (189) into the case.
  4. Oil pan (221) and a new gasket (220).
  5. Screws (222).

  - Tighten
    
    1. Screws (222) to 20 N·m (15 ft·lbs.).

- Install or Connect (Figure 66)
  
  1. Switch (260). A. Plunger
  2. Wire connector.

  - Adjust (Figure 66)
    
    1. Press the plunger (A) as far forward as possible.
    2. Press the accelerator pedal to the floor.

VACUUM MODULATOR (THM 400)

- Remove or Disconnect (Figure 67)
  
  1. Pipe (267) from the modulator port.
    1. Hose.
  2. Vacuum modulator (178).
    1. Screw and the retainer.
    2. Seal.
  3. Pipe (267) if needed.
    1. Hose.
    2. Note the position of the pipe and any clips.

  - Clean
    
    1. All parts using soapy water. Air dry.

  - Inspect
    
    1. Modulator and pipe for kinks, cracks and damage.
    2. Hoses for cracks, wear and dry rot.

- Install or Connect (Figure 67)
  
  1. Pipe (267) if removed.
    1. Seat the pipe against the manifold fitting.
    2. The pipe must be routed in the position it was removed from.
  2. Vacuum modulator (178).
    1. New seal.
    2. Retainer and the screw.
  3. Pipe (267) onto the modulator port.

  - Important
    
    1. The pipe must not be twisted or bent.
  4. Transmission fluid if needed. Refer to “Checking and Adding Fluid” in this section.

SPEEDOMETER DRIVEN GEAR—VEHICLE SPEED SENSOR

- Remove or Disconnect (Figure 68)
  
  1. Apply the parking brake.
  2. Speedometer cable (277).
  3. Screw and the retainer.
  4. Sleeve and the seal.
  5. Driven gear or speed sensor (280), as used.

- Inspect
  
    1. Gear teeth for nicks and burrs.
    2. All parts for wear and damage.

- Install or Connect (Figure 68)
  
  1. Driven gear or speed sensor (280) as used.
  2. New seal and the sleeve.
  3. Retainer and the screw.
  4. Speedometer cable (277).
- Release the parking brake.
5. Transmission fluid if needed. Refer to “Checking and Adding Fluid” in this section.

GOVERNOR

Remove or Disconnect (Figure 69)
- Raise the vehicle.
- Lower the transmission if needed for clearance, refer to “Transmission Replacement” in this section.

1. Governor cover (287) and the seal or gasket as used.
   - THM 700-R4
     - Tap around the cover flange with a punch.
   - THM 400
     - Remove the screws.

Important
- Do not damage the governor cover. If the cover is damaged it must be replaced.
2. Governor (182).

**Clean**
- Governor using solvent. Air dry and blow out all passages using dry compressed air.

**Inspect**
- All parts for nicks, burrs, scoring and galling.
- Governor sleeve for binding.
- Governor valve for binding.
- Driven gear for loose fit.
- Weight springs for kinks or damage.
- Weights for binding.
- Valve entry opening. With the weights held all the way outward, the opening should be 5.1 mm (0.020 in.) (Figure 70).
- Valve exhaust opening. With the weights held all the way inward, the opening should be 5.1 mm (0.020 in.) (Figure 71).

- If the weights, sleeve, or valve do not operate freely, disassemble and clean the governor.
- If the driven gear must be replaced, the governor must be disassembled.

**Important**
- All the governor parts are a select fit. Except for the driven gear, the governor must be replaced as an assembly if repair is needed.

**Disassemble (Figures 72 and 73)**
1. Remove the governor weight pins (310).
   - Cut off one end of each pin to remove them.
2. Remove the thrust cap (317), the weights (315 and 316) and the springs (314).
3. Remove the valve (311) from the sleeve.
4. Remove the driven gear, if needed.
   - Drive out the retaining pin using a punch or \( \frac{1}{8} \) in. drill.
7A-70 AUTOMATIC TRANSMISSION

Figure 72—Removing the Governor Weight Pins

- Press the gear out of the sleeve using a punch, with the gear supported in a press with two 2.778 mm (7/64 in.) plates in the exhaust slots.

5. Clean the governor parts and inspect for damage.

Assemble (Figures 73, 74 and 75)

1. New driven gear into the sleeve, if needed.
   - Press the gear in until it is almost seated using a socket with the governor supported in a press with two 2.778 mm (7/64 in.) plates in the exhaust slots.
   - Remove any shavings from the gear hub and press the gear in until it is seated.
   - Drill a new pin hole 90° from the old one using a 1/8 in. drill in a press.

2. Valve (311) into the sleeve.

3. Springs (314), the weights (315 and 316) and the thrust cap (317) onto the governor, aligning the pin holes.

4. New weight pins (310) and crimp both ends of each pin.

Install or Connect (Figure 69)

1. Governor (182).

2. Governor cover (287) and a new seal or gasket as used.
   - THM 700-R4.
     - Put a thin coat of Loctite Cup Plug Sealant II, or equivalent, on the cover.
     - Tap the cover into place using a brass drift.
   - THM 400.
     - Screws.

   - Raise the transmission if needed. Refer to "Transmission Replacement" in this section.
AUTOMATIC TRANSMISSION 7A-71

• Lower the vehicle.
3. Transmission fluid if needed. Refer to "Checking and Adding Fluid" in this section.

2-4 SERVO (THM 700-R4)

Remove or Disconnect (Figures 76 and 77)

Tool Required:
J-29714 Servo Cover Compressor.
• Raise the vehicle.
• Lower the transmission if needed for clearance. Refer to "Transmission Replacement" in this section.
1. Retaining ring and the cover (223) using J-29714.
2. Seal from the cover.
3. 4th apply piston (224).
4. 2nd apply piston assembly (301).
5. Spring (239).

Disassemble (Figures 78 and 79)

Tool Required:
J-22269-01 Piston Compressor.
1. Housing (230) from the piston (233).
   • Seal from the housing.
2. Retainer ring from the pin (237).
   • Washer and the spring.
3. Pin (237).
   • Seals from the pin.
4. Retainer ring from the piston (233) using J-22269-01.
   • Retainer and the spring.
   • Seals from the piston.

Clean
• All parts using solvent. Air dry.

Inspect
• Pistons for porosity and damage.
• Seal grooves for damage.
• Cover for porosity and damage.
• Seals for nicks and cuts and binding in the seal grooves.

1. If damage is found, check for the cause of the damage.
   • Springs for kinks and bending.
   • Pin for wear and burrs.

Important
   • Check the case servo bore for damage and sharp edges.

Measure (Figures 80 and 81)

Tools Required:
   J-33037 Band Apply Pin Tool
   Vernier calipers or micrometer

1. Servo pin length (Figure 80).
   • Install pin and J-33037 as shown.
   • Apply 11.0 N·m (110 in. lbs.) torque and check the gage slot (A).
     • If the white line is seen in the slot, the pin is correct.
     • If the white line is not seen in the slot, replace the pin using the chart.
   • Remove the pin and J-33037.

2. Piston and housing dimension (figure 81).
   • Measure the piston dimension (C).
   • Measure the housing dimension (D).
   • Check the chart for the proper dimensions.

Assemble (Figures 78 and 79)

Tool Required:
   J-22269-01 Piston Compressor

1. Retainer and the spring in the piston (233).
   • New seals on the piston.
   • Retainer ring using J-22269-01.

2. Pin (237).
   • New seals on the pin.

3. Retainer ring on the pin.
   • Spring and the washer.

4. Housing (230) on the piston (233).
   • New seal on the housing.
Pin is preset at factory and must not be re-adjusted.

Important
- Be sure the proper seals are in the proper positions (Figure 77).

Install or Connect (Figures 76 and 77).

Tool Required:
J-29714 Servo Cover Compressor
1. Spring (239).
2. 2nd apply piston assembly (301).
3. 4th apply piston (224).
4. New seal on the cover.
5. Cover (223) and the retaining ring using J-29714.
- Raise the transmission if needed. Refer to “Transmission Replacement” in this section.
- Lower the vehicle.
6. Transmission fluid if needed. Refer to “Checking and Adding Fluid” in this section.

TRANSMISSION REPLACEMENT

If the transmission is being replaced for clearance, do steps 1–8 only.

Remove or Disconnect (Figure 83)

Tool Required:
J-21366 Converter Holding Strap

1. Negative battery cable.
2. Air cleaner, and the TV cable from the throttle linkage, if the transmission is being removed.
3. Transmission fluid.
4. Shift linkage.
5. Propeller shaft, refer to PROPELLER SHAFT (SEC. 4A).

1. Front propeller shaft, if used, from the transfer case.
6. The support bracket at the catalytic converter.
7. Transmission crossmember.
8. Transmission far enough for clearance to reach other components.
9. Dipstick tube (221) and the seal.
10. Speedometer cable.
11. Vacuum modulator line, if used.
12. Electrical connectors from the transmission.
13. Cooler lines (223).
14. Transfer case shifter and move it aside, refer to TRANSFER CASE (SEC. 7D).
15. Dampener and the support, if used.
16. Transmission support braces (222).
17. Converter housing cover (228).

Important

Do not stretch or damage any cables, wires or other components when lowering the transmission.

9. New seal using J-21426 or J-24057 as needed.
10. Speedometer cable.

1. Note the location of any brackets or clips and move them aside.
2. Lower the vehicle.
3. New transmission fluid. Refer to “Specifications” for the proper amount.
4. Transmission support braces.
5. The support and dampener, if used.
6. Propeller shaft, refer to PROPELLER SHAFT (SEC. 4A).
7. Front propeller shaft, if used, from the transfer case.
8. Automatic transmission.
9. Dipstick tube (221) and the seal.
10. Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).

11. Vacuum modulator line, if used.
12. Electrical connectors from the transmission.
13. Cooler lines (223).
14. Transfer case shifter and move it aside, refer to TRANSFER CASE (SEC. 7D).

15. Dampener and the support, if used.

17. Converter housing cover (228).

Important

Support the engine with a jack or hoist before disconnecting the transmission.

20. Transmission (225) from the vehicle.

Clean

1. Transmission case using a solvent dampened cloth, do not allow solvent to enter the transmission. Air dry.
2. All hardware and flywheel cover using solvent. Air dry.

Inspect

1. All parts for wear and damage.
2. All seals and fittings for signs of leakage.
3. Torque converter for stripped or broken weld nuts or screw holes.
4. Transmission case for porosity.

Install or Connect (Figure 83)

Tool Required:
J-21366 Converter Holding Strap

1. If the transmission was lowered for clearance only, do steps 13–20.

2. Screws (226).

Tighten

1. The torque converter must be flush onto the flywheel and rotate freely by hand.
2. All brackets, clips and harnesses must be in the positions they were removed from.
3. Do not install the dipstick tube or the transmission support brace screws.
4. Converter housing cover (228).
5. The support and cover under the lip of the engine oil pan.
6. Transmission support braces (222).

11. Electrical connectors to the transmission.
12. Dipstick tube (221) with a new seal.
   • Uncover the opening and install the seal first.
   • Screw (226).
13. Transmission into place.

Important
   • Do not pinch or damage any cables, wires or other components when raising the transmission.

14. Transmission crossmember and the transmission mount.
   • Any components that were removed for clearance.
   • Remove the transmission jack.
15. The support bracket at the catalytic converter.
16. Propeller shaft, refer to PROPELLER SHAFT (SEC. 4A).
   • Front propeller shaft to the transfer case, if used.

**DESCRIPTION**

Manual transmissions are identified by: (A) the number of forward gears, and (B) the measured distance between centerlines of the main shaft and the countergear.

**3-SPEED 76MM**

The three speed Muncie 76mm transmissions (RPO's M62 and M64) are in constant mesh and fully synchronized in all forward speeds with two sliding synchronizer sleeves.

Gearshift levers are either a floor-type or a steering column-type shift lever.

**4-SPEED 117MM**

The four speed Muncie 117mm transmission (RPO M20) uses a constant mesh first gear and synchronized second, third and fourth gears.

Gear shifting is done with a transmission cover mounted shift lever. The cover has a ball pin type interlock which stops the transmission from being shifted into two gears at one time.

**INSPECTION**

- Before repairing the transmission, check the clutch and shifting linkages to be sure the problem is in the transmission.
- If a hydraulic clutch is used, there are no adjustments for linkage or clutch pedal.

**CONTROL LINKAGES**

1. Check the clutch and shift linkage for dirt, wear, or damage.
2. Check clutch free pedal travel adjustment and adjust as necessary. Refer to CLUTCH (SEC. 7C).
3. Check the shift linkage for worn swivels, mounting brackets or damaged cordon shaft.
4. Check the shift linkage adjustment and adjust as necessary.

**STEERING COLUMN SHIFT CONTROL**

1. Remove the shift control rods from the column levers.
2. Check shift effort at the shift control lever knob.
3. If the effort is more than 9 N (2 lb.), adjust the steering column lower bearing. Refer to STEERING (SEC. 4B).
4. Lubricate all rod and swivel connections and recheck shift effort.
TRANSMISSION SHIFT EFFORT

1. Remove the shift rods at the transmission.
2. Line up the problem gear by shifting into the gear and back to neutral.
3. Check the effort needed to shift into the problem gear using a torque wrench.
4. If the shift effort is more than 5 N·m (50 in. lbs.) and the shift lever shaft is clean and not damaged, add an anti-chatter lubricant, (positract additive) to the transmission.
5. If the shift effort is still high, repair the transmission as needed.

**DIAGNOSIS OF MANUAL TRANSMISSION**

The following diagnosis information is to be used only as a guide to locating a transmission problem.

ON VEHICLE SERVICE

Install or Connect (Figure 1)

- Raise the vehicle.
- Transmission oil.
- Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
- Parking brake if used. Refer to BRAKES (SEC. 5).
- Speedometer cable (112) and the seal (113).
- New transmission oil. Refer to "Drain and Fill" in this section.
- New gasket (120).
- Retainer (121) and the screws (125).
- Transmission mount.
- Remove the jack.
- Flange (122) and the nut (123).
- New seal (113) and the speedometer cable (112).
- Parking brake if used. Refer to BRAKES (SEC. 5).
- Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
- New transmission oil. Refer to "Drain and Fill" in this section.
- Lower the vehicle.

REAR RETAINER SEAL (4 SPEED)

Remove or Disconnect (Figure 2)

- Raise the vehicle.
- Transmission oil.
- Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
- New seal (113).
- New gasket (120).
- Retainer (121) and the screws (125).
- Transmission mount.
- Remove the jack.
- Flange (122) and the nut (123).
- New seal (113) and the speedometer cable (112).
- New transmission oil. Refer to "Drain and Fill" in this section.
- Lower the vehicle.

SPEEDOMETER DRIVEN GEAR

Remove or Disconnect (Figures 1 and 2)

- Raise the vehicle.
- Speedometer cable (112) and the seal (113).
- Adapter (111) if used.
- Retainer (106) and the screw (107) if used.
- Sleeve (110).

SHIFT LINKAGE ADJUSTMENT

COLUMN SHIFT LINKAGE

Adjust (Figures 5 and 6)

• The first and reverse shift rod (130) must be adjusted before the second and third shift rod (134).
1. Loosen the screw (139) if needed.
2. Put the transmission lever in place.
   — For shift rod (130), move the shift lever (128) to the front detent (Reverse).
   — For shift rod (134), move the shift lever to the front detent then back one, (neutral).
3. Put the column lever in place.
   — For shift rod (130), move the column lever into “Reverse” and lock the steering column.
   — For shift rod (134), move the column lever into “Neutral” and put a 0.249-0.250 in. gage pin through the levers (149 and 150) and the relay lever (151) (figure 6).
4. Hold the shift rod (130 or 134) down tightly in the swivel (141) and tighten the screw (139).
Figure 8—Floor Shift Control (3 Speed/4 Speed O.D.)

1. Lock the steering column, or take the gage pin out.

5. Lubricate all rod and swivel connections. Refer to MAINTENANCE AND LUBRICATION (SEC. 08).

FLOOR SHIFT LINKAGE

Adjust (Figure 7)

1. Loosen the nuts (165 and 167) if needed.
2. Move the shift control lever (158) into “Neutral”.
3. Move the shift levers (162) to the front detent then back one, (neutral).
4. Put a 0.249-0.250 in. gage pin through the control levers (158).
5. Hold the shift rods forward tightly in the swivels (166) and tighten the nuts (165 and 167).
6. Remove the gage pin and lubricate the shift control. Refer to MAINTENANCE AND LUBRICATION (SEC. 08).

- Wipe the lever with a damp rag before sliding it into place.
8. Boot (178) and the screws (186).
- Plate (187), if used.
9. Nut (176) and the knob (175).
10. Lubricate the shift control and the shift linkage. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).
- Adjust the shift linkage.

**SHIFT CONTROL LEVER (4 SPEED)**

**Remove or Disconnect (Figure 9)**
1. Transfer case shift lever boot if used, refer to TRANSFER CASE (SEC. 7D).
2. Screws (193) and the retainer (194) if used.
3. Screws (193) if used.
5. Lever (190).
- Push the cap (192) down and turn counter-clockwise (A).

**Install or Connect (Figure 9)**
1. Lever (190).
- Push the cap (192) down and turn clockwise (B).
2. Boot (191).
3. Screws (193) if used.
4. Retainer (194) and the screws (193) if used.
5. Transfer case shift lever boot if used. Refer to TRANSFER CASE (SEC. 7D).

**SIDE COVER**

**Remove or Disconnect (Figure 10)**
- Raise the vehicle.
2. Transmission oil.
3. Shift rods (figure 7).
- Move the shift levers into neutral.
4. Nut (202), the washer and the reverse shift lever (200), (4 speed O.D.).
   • Seal (209).
5. Screws (212), spring washers (213) and the brackets (214).
6. Side cover (205).

⚠ Important
   • Note the positions of the shift forks while removing.
7. Reverse detent ball (208) and the spring (207), (4 speed O.D.).
8. Gasket (204).
   • Scrape all gasket material from the cover and the case.

️️ Install or Connect (Figure 10)
1. New gasket (204).
2. Reverse detent spring (207) and the ball (208), (4 speed O.D.).
3. Side cover (205).
4. Brackets (214), new spring washers (213) and the screws (212).

⚠ Important
   • The screw with the large shoulder is a locating screw and must be installed in the rear-center hole (A).
5. Reverse shift lever (200), the washer and the nut (202), (4 speed O.D.).
   • New seal (209).
6. Shift rods (figure 7).
7. Harnesses (206) as used.
8. New transmission oil. Refer to "Drain and Fill" in this section.
   • Lower the vehicle and adjust the shift linkage.
TRANSMISSION REPLACEMENT

**Remove or Disconnect (Figures 1 and 2)**

Tool Required:
J-1126, Transmission Guide Pin (4 speed)

- Raise the vehicle.
- Transmission oil.
- Shift control and rods if used, (3 speed/4 speed O.D.).
  - Shift lever, (4 speed).
- Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
- Transfer case if used. Refer to TRANSFER CASE (SEC. 7D).
- Parking brake and controls if used. Refer to BRAKES (SEC. 5).
- Speedometer cable (112) and the seal (113).
- Wiring harnesses as used.
- Exhaust pipes. Refer to EXHAUST (SEC. 6F).
  - Support the transmission with a jack.
- Any parts if needed for clearance.
- Crossmember.
- Screws (101) and the spring washers (100).
  - Remove the top two first and install guide pins J-1126, (4 speed).
- Transmission (104).

**Important**
- Do not let the transmission hang from the clutch.
- Pull the transmission straight back on the clutch hub splines.
- Support the clutch release bearing.
- Plugs (114), if they are loose or damaged.
  - Note the location of the plugs before removing.

**Install or Connect (Figures 1 and 2)**

Tool Required:
J-1126, Transmission Guide Pin (4 speed)

1. New plugs (114) if needed.
   - Put a thin coat of high temperature grease on the main drive gear splines.
2. Transmission (104).
   - Shift the transmission into high gear before installing.
   - Install guide pins J-1126 in the top two holes (4 speed).
   - Remove the clutch release bearing support.

**Important**
- Do not force the transmission into the clutch.
- Do not let the transmission hang from the clutch, leave the jack under the transmission to support it.
3. New spring washers (100) and the screws (101).
   - Install the two bottom screws before removing the guide pins, (4 speed).
   - Remove the jack.
5. Any parts that were removed for clearance.
6. Exhaust pipes. Refer to EXHAUST (SEC. 6F).
7. Wiring harnesses as used.
8. New seal (113) and the speedometer cable (112).
9. Parking brake lever and controls if used. Refer to BRAKES (SEC. 5).
10. Transfer case if used. Refer to TRANSFER CASE (SEC. 7D).
11. Propeller shaft. Refer to PROPELLER SHAFT (SEC. 4A).
12. Shift control and rods if used, (3 speed/4 speed O.D.).
   - Shift lever (4 speed).
   - Adjust the shift linkage.
13. New transmission oil. Refer to “Drain and Fill” in this section.
   - Lower the vehicle.

DESCRIPTION

CLUTCH

The principal components on a clutch are the driven plate, pressure plate, diaphragm-type spring and a release bearing.

The driven plate is splined on the transmission clutch shaft so that it can move back and forth when the clutch is disengaged, and can turn the shaft when the clutch is engaged. The driven plate has friction pads riveted to both sides of it, and a flexible center with springs to absorb vibration.

The pressure plate has a machined surface that fits against the driven plate and a diaphragm-type spring mounted in a cover on the pressure plate. The spring holds the pressure plate and driven plate together against the engine flywheel when the clutch is engaged.

The release bearing is a ball-thrust bearing on a sleeve that pushes in on the center of the diaphragm spring, releasing pressure on the pressure plate and driven plate to disengage the clutch.

CLUTCH CONTROLS

HYDRAULIC CONTROLS - R-V MODELS

The hydraulic clutch has a master cylinder with a separate reservoir. The clutch pedal moves the master cylinder push rod and a secondary cylinder at the clutch housing moves the clutch fork and the release bearing.

MECHANICAL CONTROLS - G AND P MODELS

G models have a pull rod from the clutch pedal that moves a cross lever. The cross lever moves the clutch fork and the release bearing with an adjustable rod.

P models have an upper pull rod from the clutch pedal to a bell crank lever and a lower pull rod from the bell crank lever to a cross lever. The cross lever moves the clutch fork and the release bearing with an adjustable rod.

INSPECTION

Before repairing the clutch, check the transmission and shift linkage, and the engine mounts to be sure the problem is in the clutch.

LINKAGE

1. Check the clutch rods for bending and damage.
2. Check for worn swivels and loose or damaged mounting brackets.
3. Check the clutch lever for bending, wear and damage.
   - Be sure there is some clearance between the clutch lever and the mounting brackets and ball studs.
4. Lubricate the clutch linkage.

CLUTCH PEDAL

1. Check the bushings for dirt, wear and damage.
2. Check the clutch release.
   - Hold the clutch pedal 12.7 mm (½ in.) above the floor mat with the engine running and the parking brake on.

   • Move the shift lever from first gear to reverse gear and back several times.
   • If the shift is smooth, the clutch is disengaging fully.
   • Adjust the clutch linkage and repeat, if needed.

RELEASE BEARING

1. Check the clutch fork for dirt, wear and damage.
2. Check the clutch fork for proper installation and lubrication.
3. Check the release bearing and clearance between the spring fingers and the transmission.

HYDRAULIC CLUTCH

1. Check the hoses for cracks and wear.
2. Check the cylinders for loose mounting screws and signs of leakage.
3. Check the clutch pedal travel, it should be 210.8 mm (8.3 in).
4. Check the secondary push rod travel at the clutch fork, it should be at least 25.4 mm (1.0 in).
5. Bleed the controls and repeat as needed.
## DIAGNOSIS OF CLUTCH

<tbody>
<tr>
<td>Will Not Disengage (Pedal to the floor and hard to shift into reverse).</td>
<td>1. Linkage loose or out of adjustment. 2. Air in the hydraulic system. 3. Master or secondary hydraulic cylinder seals worn. 4. Not enough pedal travel. 5. Release bearing worn or damaged. 6. Driven plate worn or damaged. 7. Clutch fork off the ball stud. 8. Driven plate binding. 9. Driven plate run-out more than 5.08 mm (0.20 in.).</td>
<td>1. Tighten or adjust. 2. Bleed and check for damage. 3. Repair. 4. Adjust the linkage or trim the pedal bumper. 5. Replace. 6. Replace. 7. Install correctly and lubricate. 8. Repair or replace the plate or clutch gear. 9. Replace.</td>
</tr>
<tr>
<td>Slipping.</td>
<td>1. Linkage out of adjustment. 2. Driven plate friction pads worn or oil soaked. 3. Pressure plate or flywheel warped. 4. Diaphragm spring weak. 5. Driven plate overheated or not seated.</td>
<td>1. Adjust. 2. Replace. Check for leaks as needed. 3. Replace as needed. 4. Replace. 5. Allow to cool and make 30-40 normal starts - DO NOT OVERHEAT.</td>

<tr>
<td>Rattling (Transmission Click).</td>
<td>1. Diaphragm spring weak. 2. Clutch fork loose or off the ball stud. 3. Driven plate springs weak or oil in the damper.</td>
<td>1. Replace the pressure plate. 2. Replace the retaining spring or install the fork correctly. 3. Replace and check for leaks as needed.</td>
</tr>
<tr>
<td>Release Bearing Noisy With The Clutch Engaged</td>
<td>1. Linkage out of adjustment. 2. Release bearing binding. 3. Clutch fork off the ball stud or loose spring tension. 4. Linkage return springs weak.</td>
<td>1. Adjust. 2. Clean, or replace if damaged, and lubricate. 3. Install, and lubricate. 4. Replace.</td>
</tr>
<tr>
<td>Noisy.</td>
<td>1. Release bearing worn or damaged. 2. Clutch fork off the ball stud. 3. Pilot bearing loose.</td>
<td>1. Replace. 2. Install correctly and lubricate. 3. Replace. Refer to ENGINE (SEC. 6A).</td>
</tr>
<tr>
<td>Pedal Stays On The Floor When Disengaged.</td>
<td>1. Linkage or release bearing binding. 2. Diaphragm spring weak. 3. Return springs being over traveled.</td>
<td>1. Free up (or replace) and lubricate. 2. Replace the pressure plate. 3. Adjust the linkage or replace the pedal bumper if worn.</td>
</tr>
<tr>
<td>Pedal Is Hard To Push.</td>
<td>1. Linkage binding. 2. Hydraulic line blocked or crimped. 3. Master or secondary cylinders binding. 4. Driven plate worn.</td>
<td>1. Free up (or replace) and lubricate. 2. Clean out or replace. 3. Repair or replace as needed. 4. Replace.</td>

ON-VEHICLE SERVICE

Install or Connect (Figure 1)
1. New bumper (111) if needed.
2. New spacer (110) and new bushings (104).
   • Coat with grease before installing.
3. Spring (103), the pedal (109) and the stud (101).
   • Remove the long screw or rod while installing the stud.

Important
• The stud must be installed in the direction shown.
4. Braces (102 and 112).
5. Nuts (100).
6. New wave washer (108) and the push rod (107).
   • The washer must stand off the pedal as shown.
7. Washer (106) and the retainer (105).
8. Neutral start switch.
9. The lower left side air conditioning duct, if used.
10. The lower steering column covers.
11. Negative battery cable.
   • Lubricate the clutch pedal. Refer to MAINTENANCE
     AND LUBRICATION (SEC. 0B).

MECHANICAL CLUTCH PEDAL

Remove or Disconnect (Figure 2)
1. Negative battery cable.
2. Cotter pin (132) and the washer (131).
3. Wave washer (130).
4. Neutral start switch (125).
   • Note the direction the switch is mounted in.
5. Nut (120) and the spring washer (121).
6. Screw (133) and the washer (136).
   • Note the direction the screw is mounted in.
   • Remove the washer (134) if used.
7. Arm (135) and the wave washer (122).
8. Pedal rod (128) and the bushing (129).
   • Push the pedal down, move it to the side and let
     it up to release the spring.
   • Slide a long screw or rod through the bracket
     while removing the pedal to keep the brake pedal
     in place.
12. Bumper (124) if it is worn or damaged.

Clean (Figure 2)
• Metal parts with solvent. Wipe dry.
• Plastic and rubber parts with a dry rag.

Inspect (Figure 2)
• Pedal (126) for wear and bending.
• Bushings (123 and 129) for cracks and wear.

Install or Connect (Figure 2)
1. New bumper (124) if needed.
2. Bushings (123).
   • Coat the bushings with petroleum jelly.
3. Pedal (126).
   • Slide the screw or rod out while installing the pedal.

4. Spring (127).
   • Hold the pedal up, next to the pedal stop to hook the spring.
   • Push the pedal down, slide it to the side and let it up against the pedal stop.

5. Bushing (129) and the pedal rod (128).

6. New wave washer (122) and the arm (135).

7. Washer (136) and the screw (133).
   • Install the washer (134) if used.
   • Install the screw in the direction it was removed from.

8. New spring washer (121) and the nut (120).

   • Install the switch in the position it was removed from.

10. New wave washer (130).

11. Washer (131) and a new cotter pin (132).

12. Negative battery cable.
   • Adjust the clutch linkage. Refer to "Free Travel Adjustment" in this section.
   • Lubricate the clutch pedal. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).

**MASTER CYLINDER AND RESERVOIR**

**Remove or Disconnect (Figure 3)**

1. Negative battery cable.
2. The lower steering column covers.
3. The lower left side air conditioning duct, if used.
4. Retainer (105) and the washer (106).
5. Push rod (107) and the wave washer (108).
6. Reservoir hose (145).
7. Secondary cylinder hydraulic line (142) from the master cylinder (144).
8. Nuts (143) and the master cylinder (144).
9. Gasket (141).
   • Scrape all gasket material from the master cylinder and the cowl.
10. Screws (146) and the reservoir (140).

**Disassemble (Figure 4)**

1. Remove the adapter (221) and the seal (220).
2. Pull the dust cover (228) back and remove the snap ring (227).
3. Shake the push rod (107) and the plunger (224) out.
4. Remove the seal (226). Remove the spring (230), the support (222), the seal (225) and the shim (223).

**Clean (Figure 4)**

• All parts with clean brake fluid.
**Inspect (Figure 4)**
- The cylinder bore and the plunger for scratches, ridges, and pitting.
- The dust cover for wear and cracking.

**Assemble (Figure 4)**
- Lubricate all seals with clean brake fluid.
1. Install the shim (223) and a new seal (225) with the flat against the shim (223). Install the support (222) and the spring (230).
2. Install a new seal (226).
3. Coat the cylinder bore with clean brake fluid and slide the plunger (224) and the push rod (107) in.
4. Push the push rod (107) in and install the snap ring (227). Coat the inside of the dust cover (228) with grease and slide it into place.
5. Install a new seal (220) and the adapter (221).

**Install or Connect (Figure 3)**
1. Reservoir (140) and the screws (146).
2. New gasket (141).
3. Master cylinder (144) and the nuts (143).
4. Secondary cylinder hydraulic line (142) to the master cylinder (144).
5. Reservoir hose (145).
6. New wave washer (108) and the push rod (107).
7. Washer (106) and the retainer (105).
8. The lower left side air conditioning duct, if used.
9. The lower steering column covers.
10. Negative battery cable.

- Fill the reservoir. Refer to "Specifications" in this section.
- Bleed the clutch system. Refer to "Hydraulic Clutch Bleeding" in this section.

**SECONDARY (SLAVE) CYLINDER AND HYDRAULIC LINE**

**Remove or Disconnect (Figure 5)**
1. Negative battery cable.
   - Raise the vehicle.
2. Hydraulic line (142) from the secondary cylinder (153).
3. Nuts (151) and the secondary cylinder (153).
4. Hydraulic line (142).
   - Hydraulic line (142) from the master cylinder (144).
   - Nut (150) and the hydraulic line (142).
   - Install the nut (150) to hold the speedometer cable (B) in place.

**Important**
- Cover all hydraulic line openings to keep dirt and moisture out of the components.

**Disassemble (Figure 6)**
1. Remove the push rod (241) and the dust cover (240).
2. Remove the snap ring (238) and shake the plunger (239) out.
3. Remove the spring (242) and the seal (237).

**Figure 4—Master Cylinder Components**

- **Clean (Figure 6)**
  - All parts with clean brake fluid.

- **Inspect (Figure 6)**
  - The cylinder bore and the plunger for scratches ridges and pitting.
  - The dust cover for wear and cracking.

- **Assemble (Figure 6)**
  1. Coat a new seal (237) with clean brake fluid and slide it into place and install the spring (242).
  2. Coat the cylinder bore with clean brake fluid and slide the plunger (239) in.
  3. Push the plunger (239) in and install the snap ring (238).
  4. Coat the inside of the dust cover (240) with grease and slide it into place. Install the push rod (241).

- **Install or Connect (Figure 5)**
  - Uncover the hydraulic line openings.
  - Hydraulic line (142).
  - Remove the nut (150).
  - Hydraulic line (142) onto the master cylinder (144).
  - Hydraulic line (142) and the nut (150).

**Important**
- The hydraulic line must be upright, as shown.

- **Remove or Disconnect (Figures 7 and 8)**
  1. Negative battery cable.
  2. Cotter pins (132), the washers (131) and the wave washers (130).
  3. Pedal rod (128) and the bushing (129).
  - Note the direction the rod was removed from.
  4. Screws (172) and the boot (171).
  5. The lower pedal rod (163), (P models only).
   - Cotter pins (160), the washers (161) and the wave washers (162).
  6. The pull back spring (166).
   - Retaining spring (164) if used.
  7. Cotter pin (167), the washer (168) and the wave washer (169).
  - The nut (165), if used.
  8. Adjusting rod (170).
  - Note the direction the rod was removed from.

**Clean (Figures 7 and 8)**
- All metal parts with solvent. Wipe dry.
- All nylon and rubber parts with a clean, dry rag.

**Inspect (Figures 7 and 8)**
- All metal parts for wear, damage and bending.
- All nylon and rubber parts for wear and cracks.

**Install or Connect (Figures 7 and 8)**
  1. Adjusting rod (170).
   - Install the rod in the direction it was removed from.
  2. New wave washer (169), the washer (168) and a new cotter pin (167).
   - The jam nut (165), if used.
  3. The pull back spring (166).
   - The retaining spring (164), if used.
  4. The lower pedal rod (163), (P models only).
   - New wave washers (162), the washers (161) and new cotter pins (160).
  5. The boot (171) and the screws (172).
   - The dimple must face the rear of the vehicle, (P models only).
  6. The bushing (129) and the pedal rod (128).
   - Install the rod in the direction it was removed from.
  7. New wave washers (130), the washers (131) and new cotter pins (132).
8. Negative battery cable.
   • Adjust the clutch, if needed. Refer to "Free Travel Adjustment" in this section.
   • Lubricate the clutch linkage. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).

HYDRAULIC CLUTCH BLEEDING

R-V MODELS

Bleed (Figures 3 and 5)
1. Fill the reservoir (140) with new DOT 3 brake fluid to the level of the diaphragm.

* NOTICE: Never, under any circumstances, use fluid which has been bled from a system to fill the reservoir, as it may be aerated, have too much moisture content and possibly be contaminated.

2. Remove the secondary (slave) cylinder (153) and tip it so the bleeder screw (152) is up.
3. Hold the clutch pedal down, open the bleeder screw (152) to let air and fluid escape, and close the bleeder screw (152). Let the clutch pedal up.
4. Repeat step 3 until all air is out of the system.

Important
- Check and refill the reservoir as needed while bleeding so that air is not drawn into the system.

5. Install the secondary cylinder (153) and refill the reservoir (140) if needed.

CLUTCH PEDAL FREE TRAVEL ADJUSTMENT

P MODELS

Adjust (Figures 7 and 10)
1. Remove the pull back spring (166).
2. Loosen the nut (201) at the swivel (202).
   - Take the swivel (202) out of the cross lever (191), (models without JF9).
3. Move the clutch fork (200) back until the clutch spring pressure is felt, and adjust the rod length.
   * Models without JF9.
   - Hold the clutch pedal against the bumper.
   - Turn the nut (201) until the swivel (202) fits into the gage hole (A), then remove all lash.
   - Install the swivel (202) with a new wave washer (169) and cotter pin (167).
   * Models with JF9.
   - Hold the clutch pedal against the bumper.
   - Loosen the nut (165) and turn the nut (203) until it is 7.37 mm (0.29-in.) from the rod shoulder (B).
   - Tighten the nut (165) and turn the nut (201) to remove all lash.
4. Install the pull back spring (166).
5. Check the clutch pedal free travel and re-adjust if needed. Refer to “Clutch Pedal Free Travel” in this section.
6. Lubricate the clutch linkage. Refer to MAINTENANCE AND LUBRICATION (SEC. 0B).

CLUTCH ASSEMBLY AND PILOT BEARING

CAUTION: When servicing clutch parts, do not create dust by grinding or sanding clutch disc or by cleaning parts with a dry brush or with compressed air. (A water dampened cloth—NOT SOAKED—should be used). The clutch disc contains asbestos fibers which can become airborne if dust is created during servicing. Breathing dust containing asbestos fibers may cause serious bodily harm.

Remove or Disconnect (Figure 11)

Tool Required:
- J-5824-01 Clutch Alignment Tool
- J-1448 Pilot Bearing Puller (Gas Engine Only)
- J-23907 Pilot Bearing Puller (6.2 L Diesel Only)

1. Transmission. Refer to TRANSMISSION (SEC. 7B).
2. Adjusting rod (170) or the secondary cylinder (153), (figures 5, 7 or 8).
   - Pull back spring (166) if used.
   - Retaining spring (164) if used.
3. Screws (216) and the cover (215).
4. Screws (208) and the flywheel housing (207).
5. Boot (210), the clutch fork (200) and the release bearing (212).
   - Pry the clutch fork (200) off the ball stud (209).
   - Pry the retainer (211) out of the clutch fork (200) if it is worn or damaged.
7. Screws (206) and the spring washers (205).

Important
- Install J-5824-01 clutch alignment tool or a used clutch drive gear to support the clutch.
- Mark the flywheel, clutch cover and a pressure plate lug for alignment when installing.
- Loosen each screw one turn at a time to avoid warping the clutch cover.
8. Cover assembly (213) and the driven plate (214).
   - Remove the clutch alignment tool.
9. Pilot bearing (217) if it is worn or damaged.
   Use J-1448 or J-23907 as needed (figure 12).

Disassemble (Figure 11)

1. Remove the screws (218) and straps (219).
   - Note the location of the retracting springs.
2. Remove the pressure plate (220).

Clean (Figure 11)
- All parts with a clean, water dampened cloth to remove any asbestos fibers.
- Clutch fork (200), the flywheel housing (207) and the ball stud (209) with solvent. Wipe dry.

NOTICE: The release bearing is permanently packed with lubricant and should not be soaked in cleaning solvent as this will dissolve the lubricant.
Inspect (Figure 11)
- All parts for wear and damage.
- Contact surfaces for scoring, and flatness with a straight edge. Driven plate run-out must not be more than 0.08 mm (0.003-in.).
- Friction pads for scoring, gouges, and loose rivets. Check to see if they are oil soaked.
- All splines for nicks, burrs and sliding fit.
- All springs for bending and breaks.
- Boot for tears and brittleness.

Measure (Figure 11)
- Transmission pilot hole in the clutch housing for run out using a dial indicator. Run out should not be more than 0.380 mm (0.015-in.).

Assemble (Figure 11)
1. Install the pressure plate (220).
   - Important
     - Line up the marks made during removal.
2. Straps (219) and the screws (218).
   - Install the retracting springs in the positions they were removed from.

Install or Connect (Figure 11)
Tool Required:
- J-5824-01 Clutch Alignment Tool
- J-1522 Pilot Bearing Driver (Gas Engine Only)
- J-34140 Pilot Bearing Driver (6.2 L Diesel Only)

1. New pilot bearing (217) if needed. Use J-1522 or J-34140 as needed to drive the bearing in until the tool bottoms out.
   - Gas Engine
     - Lubricate the bearing with a few drops of machine oil.
   - 6.2 L Diesel Engine
     - The bearing is sealed and does not need any lubrication.
2. Driven plate (214) and the cover assembly (213).
   - Important
     - Install J-5824-01 clutch alignment tool or a used clutch drive gear to support the clutch.
     - Align the marks made during removal.
3. New spring washers (205) and the screws (206).
   - Important
     - Remove the clutch alignment tool.

NOTICE: Be careful not to use too much lubricant. Excessive lubricant may get on clutch fingers and cause slippage or damage may result to the clutch.

4. Ball stud (209).
   - Pack the seat with high temperature grease.
5. Coat the rounded end of the ball stud (209) with high temperature grease.
1. Pack the ball stud seat from the lubrication fitting (A) on the flywheel housing (207) (R-V models only).
2. New retainer (211) if needed.
3. The retainer must be installed so the fingers and tabs fit into the release bearing groove and the retainer wraps around the flat side of the ball stud head.
4. Release bearing (212), the clutch fork (200) and the boot (210).
5. Pack the inside recess (A) and the outside groove (B) of the release bearing (212) with high temperature grease as shown, (figure 13).
6. Flywheel housing (207) and the screws (216).
7. Cover (215) and the screws (216).
8. Adjusting rod (170) or the secondary cylinder (153) as needed. (Figures 5, 7 or 8).
9. Retaining spring (164) if used.
10. Pull back spring (166) if used.

DESCRIPTION

The 205 transfer case mounts behind the transmission and allows drive torque to be transmitted in a proportional split to both the front axle and the rear axle, resulting in four-wheel drive (figures 1 and 2).

The shift control lever for the transfer case is floor-mounted in the passenger compartment.

The model 205 is a two-speed unit, which offers two-wheel or four-wheel direct drive (1:1 ratio), is available in two modes: 2H for two-wheel drive or 4H for four-wheel drive. Gear reduction (1.96:1 ratio) is used in the 4L position. This unit uses constant mesh helical gears to connect the input shaft, idler gear and two output gears, thus allowing gear selection to match driving conditions.

When driving in a four-wheel mode (4L or 4Hi), turn the hubs on the front wheels to the "Locked" position.
MAINTENANCE AND ADJUSTMENT

LUBRICATION INFORMATION
Refer to Section 0B for information on intervals and types of lubricant.

LINKAGE ADJUSTMENT AND INSPECTION
Periodically inspect the linkage system for freedom of operation, proper engagement, loose attaching bolts, foreign material, etc. Adjust, clean and tighten as necessary (figure 3).

DIAGNOSIS OF THE TRANSFER CASE
Before servicing a malfunction, check the front hubs, axles, propeller shafts, wheels and tires, transmission or clutch.

ON-VEHICLE SERVICE

TRANSFER CASE REPLACEMENT

Remove or Disconnect

- Raise and support the vehicle on a suitable hoist.
- Drain the transfer case.
- Speedometer cable.
- Skid plates and crossmembers (figure 4).
- Strut rod (automatic transmissions) (figure 5).
- Rear propshaft from the case.
  - Mark propshaft for assembly reference.
  - Tie it up and move it away from the work area.
- Shift lever rod from the shift rail link.
- Bolts attaching the transfer case to the transmission adapter (figure 6).
  - Support the transfer case with a suitable stand.
- Transfer case.
  - Move the transfer case to the rear until the input shaft clears the adapter.

Install or Connect

- Support the transfer case in a suitable stand and position the case to the transmission adapter.
- Bolts attaching the case to the adapter (figure 6).
  - Bolts to 61 N·m (45 ft. lbs.).
  - Remove the stand.

2. Connecting rod to the shift rail link or connect the shift lever to transfer case as required (figure 3).
  - Tighten
    - Nuts to 17 N·m (12 ft. lbs.).
3. Front propshaft to the transfer case front output flange or yoke.
  - Tighten
    - Bolts to 102 N·m (75 ft. lbs.).
4. Rear propshaft to the transfer case rear output yoke.
  - Tighten
    - Bolts to 20 N·m (15 ft. lbs.).

SECTION 7D2

208 TRANSFER CASE

DESCRIPTION

A. Identification Tag
B. Drain Plug
C. Fill Plug
D. Indicator Switch

Figure 1—Indicator Switch, Identification, Tag and Drain and Fill Plug Location

The Model 208 transfer case is an aluminum case, chain driven, four position unit providing four-wheel drive high and low ranges, a two-wheel high range and a neutral position. The model 208 is a part-time four-wheel drive unit. Torque input in four-wheel high and low ranges is the same (figure 1).

A two-piece aluminum case contains front and rear output shafts, two drive sprockets, a shift mechanism and a planetary gear assembly. The drive sprockets are connected and operated by the drive chain. The planetary assembly, which consists of a four pinion carrier and an annulus gear, provides the four-wheel drive low range when engaged. Reduction ratio is 2.61:1 in this range.

SHIFT CONSOLE AND LEVER CONTROLS

A floor mounted shift lever is used to select the operating range (figure 2). The shift lever is located on the floorpan transmission tunnel adjacent to the transmission gearshift lever. The shift pattern is not in a straight line for 208 models (figure 3).

FOUR-WHEEL DRIVE INDICATOR LAMP

An indicator lamp mounted in the instrument panel, alerts the driver whenever the vehicle is being operated in four-wheel range. An indicator switch in the transfer case controls the light (Figure 2).

The switch is a ball and plunger unit activated by the range selector when four-wheel range is selected.

IDENTIFICATION

For servicing, an identification tag attached to the rear half of the transfer case provides the transfer case model number, low range reduction ratio and assembly number. If the tag is removed or becomes dislodged during service operations, reattach using an adhesive sealant such as Loctite 312 or equivalent (figure 1).

LUBRICATION

Change the lubricant at the intervals specified in the Maintenance Schedule. When adding lubricant or refilling the transfer case after servicing, use Dexron® II. Refer to the maintenance and adjustments section for lubricant change procedures and fill level.

## On-Vehicle Service

### Maintenance and Adjustment

**Case-Oil Change**

- **Remove or Disconnect**
  - Raise the vehicle.
  - Position a drain pan under the transfer case.
  - Drain and fill plugs.
  - Drain the lubricant.

- **Install or Connect**
  1. Drain plug.

    **Tighten**
    - Plug to 24 N·m (18 ft. lb.).
    - Remove the drain pan.
    - Fill the transfer case to the edge of fill plug opening with DEXRON® II.

  2. Fill plug.

    **Tighten**
    - Plug to 24 N·m (18 ft. lb.).
    - Lower the vehicle.

**Inspection**

Periodically inspect the linkage system for freedom of operation, proper engagement, loose attaching bolts and foreign material.

**Linkage Adjustments**

- **Adjust (Figures 1 and 4)**
  1. Put the transfer case lever into the 4H detent (Figure 4).
  2. Push the lower shifter lever (26) forward into the 4H detent.
  3. Install the rod swivel (21) into the shift lever hold.

---

**Figure 4—Linkage Adjustment**

4. Hang a 129 mm (0.200") gage (F) with a 6 mm (0.25 inch) radius over the rod behind the swivel.
5. Run the rear rod nut (27) against the gage with the shifter against the 4H detent.
6. Remove the gage and push the swivel rearward against the nut (27).
7. Run the front rod nut (49) against the swivel and tighten.
TRANSFER CASE REPLACEMENT

Remove or Disconnect (Figures 2, 5, 6 and 7)

- Place the transfer case in 4H detent.
- Raise the vehicle.
- Drain the lubricant from the transfer case.
1. Cotter pin from the shift lever swivel (figure 2).
2. Speedometer cable.
3. Indicator switch wire.
4. Front and rear propeller shafts.

   - Support the transfer case with a suitable stand.
8. Skid plate (figure 7).
   - Move the transfer case rearward until it is free of the transmission output shaft.
10. Gasket material.

Install or Connect (Figures 5, 6 and 7)

- Place the transfer case in 4H detent.
- Place the transfer case in a support stand.
1. Gasket to the transmission (figure 6).
2. Output shaft.

- Rotate the transfer case output shaft (turn flange) until the output shaft gear engages the transfer case input shaft.
- Move the transfer case forward until the case seats against the transmission.

NOTICE: Place the transfer case flush against the transmission. The case can be damaged if the attaching bolts are tightened when the case is cocked or in a bind.

3. Attaching bolts.
   - Tighten

BASIC ELECTRICAL

CIRCUITS

An electrical circuit starts from a supply of electricity, conducts the electricity back to the supply of electricity. There should be a device to open and close the circuit, and a protective device to open the circuit in case too much current flows in the circuit.

Electrical circuits can be set up as series circuits or parallel circuits. The circuits in trucks are usually parallel circuits.

SERIES CIRCUITS (Figure 1)

In series circuits, each electrical device is connected in the circuit so that the current can only go along one path as it flows from the power supply, around the circuit and back to the power supply.

PARALLEL CIRCUITS (Figure 1)

In parallel circuits, the electrical devices are connected by parallel wires that are joined at the start of the circuit. The current divides: part of it flows into one device, part into another.

With circuits in parallel, each circuit can be switched on and off by itself since each circuit receives electricity directly from the power supply.

CIRCUIT COMPONENTS (Figure 2)

The usual circuit path starts at the power supply which is the battery/generator system. Next in the circuit is the circuit protection component which can be a fusible link, a fuse, or a circuit breaker. Then the circuit goes to the circuit controller which can be a switch or a relay. From
There are two types of circuit breakers; automatic reset and remote reset.

CIRCUIT BREAKERS

Circuit breakers are another form of circuit protector. There are two types of circuit breakers; automatic reset and remote reset.

The automatic reset breaker opens when excess current heats a bimetallic strip, causing the strip to bend and open a set of contacts. Then the strip cools and closes the contacts. So the circuit breaker opens and closes until the excess current condition is corrected or the circuit is disconnected from the power supply.

The remote reset circuit breaker has a heating wire wound around the bimetallic strip. When an excess current happens, the strip heats, bends, and opens the contacts. Then a small current flows through the heat wire, keeping the strip hot and the contacts open. This type of breaker will stay open until either the power supply is disconnected from the circuit or the breaker is removed from the circuit. Then the breaker can cool and reset.

CIRCUIT CONTROLLERS

Circuit controllers consist of switches or relays. Switches are usually operated by a mechanical means such as a hand or lever. Switches are usually at the beginning of a circuit but can be used to control a ground path. For example, the switch controlling the headlights is at the power end of the circuit while the door switch controlling the dome light completes the ground path.

Relays are remotely controlled switches. They are used in high current circuits and in circuits controlled by sensors.

Relays are designed so that a small current circuit will be able to control a large current circuit.

WIRING HARNESS AND WIRES

Every wire is a specific size with colored or striped insulation that is indicated on the wiring diagrams. Insulation colors help to trace circuits and to make proper connections. Abbreviations and symbols used for indicating wire insulation colors and patterns are as follows:

- BLK........Black
- BRN..........Brown
- CHK.........Check
- CR........Cross
- GRN.........Green
- NAT.........Natural
- SGL.........Single
- ORN.........Orange
- GR........Gray
- PNL.........Purple
- PPL.........Tracer
- YEL.........Yellow
- WHT.........White
- BLU.........Blue
- STR.........Striper
- PINK........Pink
- DK..........Dark
- CAB ELECTRICAL 8A-3

Some wires are grouped and taped together or encased in a split plastic casing. This grouping of wires is called a harness. For some purposes, it is more practical to use a single wire protected by a braided tubing called a loom.

Wiring harnesses are joined by using a multiple plug and receptacle connector block, or a terminal post chassis junction block. In the instrument panel area plastic insulated blade-type connectors and screw-type terminals are used.

Each harness or wire must be held securely in place by clips or other holding devices to prevent chafing of the insulation.

WIRE SIZE

Wire size in a circuit is determined by the amount of current, the length of the circuit and the voltage drop allowed. Wire size is specified using the metric gage. The metric gage describes the wire size directly in cross section area measured in square millimeters.
CIRCUIT MALFUNCTIONS

There are three electrical conditions that can cause a nonworking circuit; an "Open Circuit," a "Short Circuit," and a "Grounded Circuit."

OPEN CIRCUIT (Figure 3)
An open circuit occurs whenever there is a break in the circuit. The break can be corrosion at the connector, a wire broken off in a device, or a wire that burned open from too much current.

SHORT CIRCUIT (Figure 4)
A short circuit happens when the current bypasses part of the normal circuit. This bypassing is usually caused by wires touching, salt water in or on a device such as a switch or a connector or solder melting and bridging conductors in a device.

GROUNDED CIRCUIT (Figure 5)
A ground circuit is like a short circuit but the current flows directly into a ground circuit that is not part of the original circuit. This may be caused by a wire rubbing against the frame or body. Sometimes a wire will break and fall against metal that is connected electrically to the ground side of the power supply. A ground circuit may also be caused by deposits of oil, dirt and moisture around connections or terminals, which provide a good path to ground.

CIRCUIT DIAGNOSIS
A clear understanding of the circuit and a wiring diagram are needed for effective diagnosis. Use a logical sequence of testing to find the trouble. Use the diagnostic tools. After the trouble is fixed, make sure the circuit works correctly.

DIAGNOSTIC TOOLS

UNPOWERED TEST LAMP
This tool consists of a 12 volt lamp with leads. The ends of the leads usually have alligator clamps, but various kinds of probes, terminal spades, and special connectors are used also.

The unpowered test lamp is used on an open circuit. One lead of the test lamp is grounded and the other lead is moved around the circuit to find the open. Depending on the physical layout of the circuit, sometimes it will be easier to start at the power supply and other times it is easier to start at the circuit load or ground circuit.

POWER TEST LAMP
This lamp is a pencil shaped unit with a self contained battery, a 1.5 vol lamp bulb, a sharp probe and a ground lead fitted with an alligator clip.
**Figure 6—Ammeter Circuit**

This test lamp is used mainly for testing components that are disconnected from the vehicle power supply. The power test lamp is also useful for testing suspected high resistance points in a circuit such as connectors and ground circuits that are corroded or loose.

**JUMPER**

The jumper is usually a long wire with alligator clamps. A version of the jumper has a fuse holder in it with a 10 Amp fuse. This will prevent damaging the circuit if the jumper is connected in the wrong way.

The jumper is used to locate opens in a circuit. One end of the jumper is attached to a power source and then the other end is attached to the load in the circuit, i.e.; lamp, motor. If the load works, try "jumping" to circuit points that are progressively closer to the power supply. When the circuit load stops working, the open has been located.

The jumper is also used to test components in the circuit such as connectors, switches, and suspected high resistance points.

**NOTICE:** The following instruments: Ammeter, Voltmeter, and Ohmmeter, each have a particular application for trouble shooting electrical circuits.

*When using an ammeter or voltmeter, and the value being tested is unknown, always use the highest scale first and work downward to a midscale reading whenever possible. This will avoid damage to the instrument.*

*Never use an ohmmeter in a power circuit, or as a substitute for a voltmeter or ammeter, as damage to the instrument will result.*

**AMMETER (Figure 6)**

Disconnect the circuit from the power source before connecting the ammeter. The ammeter measures the amount of electrical current, amperes, moving through a conductor. The ammeter must be placed in series with the circuit being tested. Be sure that the ammeter's positive terminal is connected to the positive (battery) side of the circuit and the ammeter's negative terminal is connected to the negative (ground) side of the circuit.

**OHMMETER (Figure 7)**

The ohmmeter is an instrument designed to indicate resistance in ohms. It is used to test the condition of a unit disconnected from the circuit.

**Ohmmeter Calibration**

When the ohmmeter probes are connected together, a circuit is completed causing the meter needle to deflect. The needle should read ZERO ohms, if it does not, rotate the CAL or ADJ knob to ZERO the needle.

When the probes are held apart, the needle moves to the maximum (infinite) resistance side of the scale.

The meter is now ready for use.

**VOLTMETER (Figure 8)**

The voltmeter (properly observed) will give the technician more information than the ammeter, ohmmeter and test lamp combined. Its application for
troubleshooting here is to measure the electrical pressure (voltage) drop in a resistance circuit.

To use a voltmeter for troubleshooting an electrical problem, connect it in parallel with the existing circuit. If the voltmeter is connected in series with the circuit being tested, the nature of the circuit would be changed and the reading would have no particular value or use. Connect the meter terminals according to polarity as shown.

The dash mounted voltmeter (in the vehicle) should also be observed for monitoring proper operation of the generator battery cranking motor, and cranking circuit. In this application, battery voltage drop can be monitored while the engine is cranking; and after the engine is running, generator output voltage can be monitored. This can be a valuable first step prior to diagnosing other electrical problems.

CIRCUIT MAINTENANCE AND REPAIR

MAINTENANCE AND REPAIR

All electrical connections must be kept clean and tight. Loose or corroded connections may cause a discharged battery, difficult starting, dim lamps, and possible damage to the generator and regulator. Wires must be replaced if insulation becomes burned, cracked, or deteriorated.

To splice a wire or repair one that is frayed or broken, always use rosin flux solder to bond the splice and insulating tape to cover all splices or bare wires.

When replacing wire, it is important that the correct size wire be used as shown on applicable wiring diagrams or parts book. Each harness or wire must be held securely in place to prevent chafing or damage to the insulation due to vibration.

Never replace a wire with one of a smaller size or replace a fusible link with a wire of a larger size.

**WEATHER-PACK CONNECTORS (Figure 12)**

Special connectors known as Weather-Pack connectors require a special tool J-28742 for servicing. This special tool is required to remove the pin and sleeve terminals. If removal is attempted with an ordinary pick, there is a good chance that the terminal will be bent or deformed. Unlike standard blade-type terminals, these terminals cannot be straightened once they are bent.

**WEATHER-PACK CONNECTORS (Figure 12)**

Special connectors known as Weather-Pack connectors require a special tool J-28742 for servicing. This special tool is required to remove the pin and sleeve terminals. If removal is attempted with an ordinary pick, there is a good chance that the terminal will be bent or deformed. Unlike standard blade-type terminals, these terminals cannot be straightened once they are bent.

**Figure 14—Twisted/Shielded Lead Repair**

Make sure that the connectors are properly seated and all of the sealing rings are in place when connecting the leads. The hinge-type flap provides a back-up, or secondary locking feature for the terminals. They are used to improve the connector reliability by retaining the terminals if the small terminal lock tangs are not positioned properly.

Molded-on-connectors require complete replacement of the connection. This means splicing a new connector assembly into the harness. Environmental connections cannot be replaced with standard connections. Instructions are provided with the Weather-Pack connector and terminal packages.

With the low current and voltage levels found in some circuits, it is important that the best possible bond at all wire splices be made by soldering the splices.

Use care when probing the connections or replacing terminals in them, it is possible to short between opposite terminals. If this happens to the wrong terminal part, it is possible that damage may be done to certain

When diagnosing for possible open circuits, it is often difficult to locate them by sight because oxidation or terminal misalignment are hidden by the connectors. Merely wiggling a connector on a sensor or in the wiring harness may correct the open circuit condition. This should always be considered when an open circuit is indicated while troubleshooting. Intermittent problems may also be caused by oxidized or loose connections.

CAB ELECTRICAL SYSTEMS

RV CAB HARNESS ROUTINGS

There are several wiring harnesses routed throughout the cab which provide continuity between the electrical components. These harnesses consist of: the instrument panel harness, the power door locks and power window harness, the radio harness, the heater harnesses, the air conditioning harnesses and the interior lighting harnesses.

INSTRUMENT PANEL HARNESS (Figure 15)

This harness is located along the upper back edge of the instrument panel. It starts from the fuse panel which is located at the left side of the dash panel, and goes up to the left side of the instrument panel and across the instrument panel to the right side of the cab.

As the instrument panel harness is routed across the instrument panel, various circuits branch off to the switches, indicators, and the instrument panel. The harness is held in place with bendable clips.

Other harnesses are carried in the same supports as the instrument panel harness. These harnesses consist of the power door locks, power window, radio, heater and air conditioning.

POWER DOOR LOCKS AND POWER WINDOWS HARNESS (Figures 16 and 17)

This harness starts at the fuse block and routes to the left and right along the instrument panel. At the middle of the instrument panel, the harness branches off to the relay assembly. The relay assembly is located on the inside of the dash panel, just above the steering column. The harness then goes to a set of connectors on the inner wheel housing. From the connectors the harness passes through a grommet in the front door opening trim panel and then through a flexible coupling to the door. Inside the door the harness branches off to the control switches, the door lock motors, and the power window motors. The harness connectors are fastened to the control switches with retaining nuts.

Figure 18—RV Rear Door Lock Harness
The rear doors power lock harness starts at a connector in the fuse block. The harness is routed along the instrument panel harness, with a branch going to the power door lock switch assembly in the instrument panel. The harness then drops down the right front door hinge frame and routes back along the right door sill to the right front door latch frame. The harness then travels up the right front door latch frame to its midpoint where a connector is located. The harness then goes to the roof halo panel and back to the rear door frame.

At the rear door frame, the harness is connected to a contact assembly on the right rear door frame. This contact assembly is aligned with a contact assembly mounted on the right rear door. From the contact assembly on the door, the harness then goes to the lock motor.

The RV fuse block holds the fuses and circuit breakers that protect the circuits. The fuse block is located on the left side of the dash panel and is fastened to the dash panel connector block with two screws. The fuse panel connects to the engine compartment harness. Power leads from the various circuits plug into the fuse block.

The fuses are encased in plastic and have twin blade connectors. The fuses are printed and color coded with the amperage rating. Refer to Figure 20.
G VAN CAB HARNESS ROUTINGS

INSTRUMENT PANEL HARNESS (Figure 21)
The instrument panel harness in the G van includes the circuits for the instrument panel gauges, indicators, main light switch, windshield wiper and washer, and the steering column controls. The harness is held in place with clips that plug into brackets which are mounted on the instrument panel.

FRONT DOOR POWER LOCK SYSTEM
(Figure 22 and 23)
The harness starts from the fuse block, which is located under the far left side of the instrument panel. The left branch of the harness has a connector at the left door hinge frame. Then the harness passes into the frame and routes down to a flexible conduit to the door. Inside the door, the harness branches; one branch going down to the door lock motor, and the other branch going up to the door lock switch.

The right branch of the harness routes across the top of the instrument panel to the right door hinge frame. The harness passes through a connector and continues into the door frame. The harness routes down to a flexible conduit. The harness passes through the flexible conduit into the door. Inside the door, the harness branches; one branch going up to the door lock switch, and the other branch going to the door lock.

SIDE DOOR POWER LOCK CIRCUIT (Figure 24)
The side door power lock circuit branches off from the left roof halo harness just behind the front door latch frame. It goes across the roof frame and down the right front door latch frame, where it connects to the door frame contact assembly. The door frame contact assembly aligns with the door contact assembly so that electrical contact is made when the door is closed. In this way, electricity is conducted to the side door power lock motor.

REAR DOOR POWER LOCK CIRCUIT (Figure 25)
The rear power door lock circuit harness is routed from the connector on the left front door hinge frame. The harness goes up the frame to the roof, rearward along the roof halo panel and then crosses over to the right rear corner, using the rear roof halo panel. The harness goes down the right rear corner to a connector just below the upper door hinge. The harness then passes through grommets and into the right rear door. Inside the door the harness connects to the power lock motor.

POWER WINDOW SYSTEM
(Figures 22, 23, 24 and 25)
This harness starts at the fuse block and routes to the left and right along the instrument panel. The harness then routes into the left and right front doors. At the left door hinge pillar, the harness routes up to the left roof halo panel, back to the first roof frame, branches to the right side of the van and rearward to the rear door. The branch that went to the right side routed down the side door hinge pillar and into the side door.

INTERIOR LIGHTING SYSTEM (Figures 26 and 27)
This circuit starts at the fuse block and routes to the body harness connector. The standard harness is then routed up the left front door hinge frame and back along the left roof halo panel. The harness branches at the first and third roof frames, with connectors located next to the left roof halo panel. The harnesses then go to the roof lamps and terminate in bulb clips. The standard harness also branches off to the door switches.

The optional harness is routed from the body harness connector to a control switch on the instrument panel. The harness then goes from the switch to the left front door hinge frame, up the frame, and back along the left roof halo panel.

When the harness reaches the first roof frame, it goes into a connector. There are two branches coming out of the connector. One branch goes to the center lamp assembly in the roof. This branch, after connecting to the center lamp assembly, continues on to the right side of the roof, where it goes into a connector. From this connector, one lead goes to the side door grounding switch. The other leads are routed down the right front door lock frame to the stepwell lamp assembly.

The other branch, coming out of the roof frame connector, goes back along the left roof halo panel, across the rear halo panel and terminates at the rear door ground switch. Also coming from this connector is a branch that goes down the left front door lock frame to the left stepwell lamp assembly.

The fuse block holds the fuses and circuit breakers that protect the circuits. The fuse block is located on the left side of the dash panel and is fastened to the dash panel connector block with two screws. The fuse block connects to the engine compartment harness. Power leads from the various circuits plug into the fuse block.

The fuses are encased in plastic and have twin blade connectors. The fuses are printed and color coded with the amperage rating. Refer to Figure 28.

**POWER DOOR LOCK SYSTEM**

**DESCRIPTION**

Individual motors operate each door lock. The direction the motor turns depends on the polarity of the supply voltage. The door lock switches control the supply voltage polarity. Each switch will lock all the doors.

Each motor has a self-resetting circuit breaker built in. Voltage is present at the door lock switches at all times. Voltage is also present on the open contacts of the door lock relay at all times.

When a door switch is moved to “Lock,” current flows through the switch and lock relay coil to ground. The relay closes, causing current to flow through the lock relay contacts, door lock motor, the unlock relay contacts, and then to ground.

When a door lock switch is moved to “Unlock,” current flows through the switch, the unlock relay contacts, the door lock motor, the lock relay contacts, and to ground. This causes the lock motor to unlock the door.

For RV models, the door lock relay is located on the dash panel, above the steering column. For G van models the door lock relay is located on front left door hinge pillar.

### POWER WINDOW SYSTEM

**DESCRIPTION**

Each power window is moved by a single permanent magnet motor. The direction the motor turns depends on the polarity of the supply voltage. The control switches control the supply voltage polarity.

Switches for controlling all the power windows are located at the driver’s door. Each passenger’s window switch controls only the window at that passenger’s position.

The motors have a self resetting circuit breaker built in. The circuit breaker allows the motor to be stalled without damage. There are no travel-limit switches.

When a window switch is moved to “UP,” current flows through the circuit breaker, the window switch, the DK BLU wire, the motor, the circuit breaker, the BRN wire, the “DN” contacts in the switch, and into the BLK wire which goes to ground.

WINDSHIELD WIPER—RV AND G MODELS

DESCRIPTION

A permanent magnet type wiper is used on RV and G Series. The motor parts-field magnets, armature, drive gear etc. are enclosed in a two piece sheet metal housing. For purposes of explanation the housing halves are referred to as upper and lower housings. The two housings are attached to each other by ten extrusions which are staked over.

The wiper motor is protected by an automatic reset type circuit breaker located on the motor brush holder assembly. A fuse located in the fuse block protects the vehicle wiring.

The wiper motor can be operated only when the ignition switch is in the “run” or “accessory” position.

The wiper motor has three brushes; the “common,” the low speed, and the high speed. When the ignition switch is “ON,” power is applied to the common brush. The low speed and high speed brushes are connected to their respective ground via the control switch. When the control switch is positioned at “HI” or “LO” speed, a ground path is connected to the high or low speed brush in the motor. The motor runs at the switch selected speed.

In order to have the wiper blades stop in their normal park position and the wiper motor shut off properly, the motor must run in LO speed. When the control switch is moved to the OFF position, the low speed brush circuit goes through a park switch located in the gear housing and then to ground at the control switch. The park switch is normally closed and this allows the wiper to keep running. When the wiper blades reach their park position, cam on the gear opens the normally closed park switch, which turns off the wiper. Refer to Figures 29 and 30.

### PROCEDURE 1 (WIPER INOPERATIVE)

**STEP 1**

IGNITION SWITCH "ON" USING A TEST LIGHT CHECK FOR VOLTAGE AT WIPER TERMINAL NO. 19

- VOLTAGE OK
- NO VOLTAGE

**STEP 2**

CHECK FUSE

- FUSE BLOWN
- FUSE OK

**Figure 31—Wiper Diagnosis**
PROCEDURE 1 (CONT.)

**STEP 3**

REMOVE THE BLOWN FUSE AND CONNECT AN AMMETER 0-30 AMP. ACROSS THE FUSE BLOCK TERMINALS. OPERATE THE WIPER MOTOR AND OBSERVE IF CURRENT DRAW EXCEEDS THE CAPACITY OF THE ORIGINAL FUSE.

CURRENT DRAW HIGH  CURRENT DRAW OK

GO TO STEP 4  REPLACE FUSE AND RECHECK SYSTEM

**STEP 4**

DISCONNECT THE WIRING FROM THE WIPER MOTOR; REPLACE FUSE AND ACTUATE THE WIPER SWITCH SEVERAL TIMES. RECHECK THE FUSE WITH THEignition SWITCH ON.

FUSE BLOWN  FUSE OK

LOCATE AND REPAIR SHORTED OR GROUNDED CONDITION IN WIRING.

PROBLEM IS IN THE MOTOR. REFER TO "WIPER REPAIR".

**STEP 5**

IGNITION SWITCH "ON." LEAVE THE WIRING CONNECTED TO THE WIPER MOTOR.
CONNECT A JUMPER WIRE FROM THE TERMINAL NO. 18 TO GROUND.

WIPER RUNS  WIPER INOP.

CHECK THE WIPER SWITCH GROUND WIRE CONNECTION. IF OK,
REPLACE THE WIPER SWITCH.

PROBLEM IS IN THE MOTOR. REFER TO "WIPER REPAIR".

PROCEDURE 2 (LO SPEED ONLY) (INOP IN HI)

**STEP 1**

IGNITION SWITCH "ON." LEAVE THE WIRING CONNECTED TO THE WIPER. CONNECT A JUMPER WIRE FROM THE TERMINAL NO. 17 TO GROUND. WIPER SWITCH IN "HI" SPEED POSITION!!

WIPER RUNS IN HI  WIPER INOP.

PROBLEM IS AN OPEN WIRE FROM TERMINAL NO. 17 TO THE DASH SWITCH.

REPAIR THE WIPER MOTOR. (LOOK FOR A HIGH SPEED HUNG BRUSH.)
PROCEDURE 3 ("HI" SPEED ONLY) (INOP IN LO)

**STEP 1**

- **IGNITION SWITCH "ON."** WIPER SWITCH IN THE "LOW" SPEED POSITION. LEAVE THE WIRING CONNECTED TO THE WIPER AND CONNECT A JUMPER WIRE FROM THE TERMINAL NO. 18 TO GROUND.

**WIPER RUNS IN LO**

- PROBLEM IS ON OPEN WIRE FROM WIPER TERMINAL NO. 2 TO THE WIPER SWITCH.

**WIPER INOP.**

- REPAIR THE WIPER MOTOR (LOOK FOR LO SPEED HUNG BRUSH).

PROCEDURE 4 (ONE SPEED—SAME IN BOTH LO AND HI).”

**STEP 1**

- **REMOVE THE WIRING FROM THE WIPER MOTOR TERMINALS 19, 18 AND 17 AND OPERATE THE WIPER IN LOW AND HIGH. (NOTE: CURRENT DRAW IS USUALLY ABOVE NORMAL—APPROX. 6.0 AMPS.)**

**WIPER OPERATES CORRECTLY**

- PROBLEM IS IN THE WIRING BETWEEN THE WIPER SWITCH AND WIPER OR A FAULTY WIPER SWITCH.

**PROBLEM STILL PRESENT**

- REPAIR THE WIPER MOTOR. CHECK FOR LO AND HI SPEED BRUSH LEADS SHORTING TOGETHER INTERNALLY.

PROCEDURE 5 (WIPER SHUTS OFF BUT BLADES DON'T RETURN TO PARK POSITION)

**STEP 1**

- **IGNITION SWITCH "ON."** WIPER SWITCH IN "OFF." LEAVE THE WIRING CONNECTED TO THE WIPER AND CONNECT A JUMPER WIRE ACROSS TERMINALS 4 AND 3.

**WIPER RUNS**

- REPLACE THE WIPER PARK SWITCH ASSY.

**WIPER INOP.**

- WIRE FROM THE WIPER TERMINAL NO. 3 TO THE WIPER SWITCH IS OPEN OR THE SWITCH IS FAULTY.

Figure 33—Wiper Diagnosis
PROCEDURE 6 (WIPER WILL NOT SHUT OFF)

STEP 1
IGNITION SWITCH IS "ON". WIPER SWITCH IS IN THE "OFF" POSITION. DISCONNECT THE WIRING FROM THE WIPER TERMINALS 4 & 3.

WIPER STOPS
REPAIR THE WIPER MOTOR
(REPLACE THE PARK SWITCH ASSY.)

WIPER STILL RUNS
GO TO STEP 2

STEP 2
REMOVE WIRING FROM WIPER TERMINALS 19, 18, 17. CONNECT 12v + TO WIPER TERMINAL 19 ONLY.

WIPER DOESN'T RUN
LOCATE AND REPAIR THE GROUND CONDITION IN THE WIRES FROM THE WIPER TERMINALS 18 OR 17 TO THE WIPER SWITCH.

WIPER STILL RUNS
REPAIR THE WIPER MOTOR
(LOOK FOR INTERNAL GRD. CONDITION IN "LO" OR "HI" BRUSHES)

PROCEDURE 7 (INTERMITTENT OPERATION)
(WIPER HAS BOTH SPEEDS)

STEP 1
REMOVE THE WIPER FUSE FROM THE FUSE BLOCK AND CONNECT AN AMMETER (0-30 AMP) ACROSS THE FUSE BLOCK TERMINALS WHERE THE FUSE WAS. TURN THE IGNITION SWITCH "ON" AND RUN THE WIPER IN "HI" SPEED WITH WINDSHIELD DRY. NOTE THE LOWEST CURRENT DRAW READING.

CURRENT DRAW: LESS THAN 5.0 AMP.
A WEAK CIRCUIT BREAKER IS INDICATED. REPLACE MOTOR END CAP ASSY.

CURRENT DRAW: EXCEEDS 5.0 AMPS.
GO TO STEP 2

STEP 2
REMOVE THE ARMS AND BLADES AND REPEAT STEP 1

CURRENT DRAW OK
REPLACE BLADE ELEMENTS
GO TO STEP 3

CURRENT DRAW HI

STEP 3
DISCONNECT WIPER LINKAGE FROM WIPER CRANK ARM AND REPEAT STEP 1.

CURRENT DRAW OK
CHECK WIPER LINKAGE FOR A BINDING CONDITION AND REPAIR OR REPLACE AS REQ'D.

CURRENT DRAW HI
PROBLEM IS IN THE WIPER MOTOR. CHECK FOR ARMATURE END PLAY, SHORTED OR GROUNDED ARMATURE.

Figure 34—Wiper Diagnosis
PROCEDURE 8 (WIPER RUNS BUT BLADES DON'T MOVE)

STEP 1
CHECK THE WIPER LINKAGE CONNECTION TO THE WIPER CRANK ARM

LINKAGE CONNECTED
WIPER GEAR IS STRIPPED.
REPLACE THE WIPER MOTOR.

LINKAGE DISCONNECTED
CHECK THE LINKAGE AND
CHECK THE SYSTEM.

WINDSHIELD WASHER—RV AND G MODELS

DESCRIPTION

The washer motor is located in the bottom of the windshield washer fluid reservoir. The washer is controlled by a washer switch, which is located on the turn signal and multi-function lever. Two wires go to the washer. The white wire is power coming from the fuse box. The same fuse that protects the washer motor also protects the wiper motor. The pink wire is the ground circuit that goes through the washer switch to ground. Refer to figures 38 and 39.

DESCRIPTION

The system consists of a compound wound rectangular-shaped motor attached to a gear box containing a parking switch in addition to the gear train. The gear train consists of a motor armature helical gear shaft which drives an intermediate gear and pinion assembly. The pinion gear of the intermediate gear and pinion drives an output gear and shaft assembly.

Turning the wiper switch to the LO speed position completes the circuits from the wiper terminals 1 and 3 to ground (Figure 48). Current then flows from the battery via wiper terminal No. 2 through the series field and divides; (1) part passes through the armature to ground via wiper terminal No. 1 to the wiper switch and (2) the second part passes through the shunt field to ground through wiper terminal No. 3 to the wiper switch. The wiper switch must be securely grounded to body metal.

Moving the wiper switch to the HI speed position opens the shunt field circuit to ground at the switch. However, the shunt field is connected to a 20 ohm resistor which is connected across wiper terminals 1 and 3. The shunt field current then flows via terminal No. 3 through the resistor to terminal No. 1 to the switch, to ground.

The parking circuit covers that portion of wiper operation when the wiper switch is turned "off" and the wiper blades have not reached the park position.

When the wiper blades are not in the normal park position, the parking switch contacts are still closed. The wiper will continue to operate until the wiper output gear
is turned to a position where its cam opens the park switch. The wiper motor circuits are completed to ground through the parking switch.

The wiper motor must be securely grounded to body metal.

The shunt field circuit is completed from terminal No. 3 via the switch to terminal No. 1 through the parking switch to ground. The series field and armature circuit is also completed from terminal No. 1 through the parking switch to ground.

The shunt field is connected direct to ground, by-passing the resistor. This results in LO speed operation during the parking operation.

When the output gear cam opens the park switch contacts, the wiper is OFF.

### DIAGNOSIS

#### WIPER SYSTEM CHECKS
1. Inspect for the following items:
   a. Wiring harness is securely connected to wiper and switch.
   
   b. Wiper motor is securely grounded to body.
   
   c. Wiper switch is securely mounted and grounded.
   
   d. Check fuse.

2. If items in Step 1 check out, try operating wiper in both "LO" and "HI" speeds, then turn wiper off (blades should return to park position). If wiper fails to operate correctly, proceed to Step 3.

3. Disconnect wiring harness from wiper and try operating wiper as shown in Figures 49, 50, and 51.

4. If wiper operates correctly independently of switch and vehicle wiring, refer to "DIAGNOSIS — WIPER ON VEHICLE."

5. If wiper still fails to operate correctly in Step 3, disconnect wiper linkage from motor crank arm and try operating wiper again. If wiper operates correctly independently of linkage, check linkage for cause of wiper malfunction.

6. If wiper fails to operate correctly independently of linkage, remove wiper motor from vehicle and refer to "DIAGNOSIS — WIPER OFF VEHICLE."

Remove or Disconnect (Figure 52, 53, and 54)

1. Two washer pump mounting screws (72).
2. Pump (71) from the gear box cover.
3. Washer pump drive cam (75).
   - Wedge off the cam and the plate using two screwdrivers.
4. Crank arm retaining nut (58).
   - Clamp the crank arm (57) in a vise before removing the nut (58).
5. Crank arm (57).
6. Seal cap (56).
7. Retaining ring (55).
8. Spacer (54).
9. Gear box cover retaining rivets.
   - Drill out the rivets.
10. Gear box cover (53).
11. Output gear and shaft assembly (52).
12. Intermediate gear and pinion assembly off the shaft (51).
13. Terminal board and park switch assembly, if necessary.
   - Unsolder the motor leads from the terminals.
15. Motor from the mounting plate.
   - Tap motor frame lightly.
16. Brush spring tension (61).
17. Armature (46) and end plate (43) from the motor frame (44).
18. End plate (43) from the armature (46).
   - There is a thrust plug (45) between the armature shaft and the end plate.
19. End play adjusting washers (47 and 41) from the armature.
   - Note the washers positions.

INSPECTION

Inspect all the parts for wear or damage. All the parts can be replaced individually except the motor frame and field, which is serviced as an assembly. Service kits provide screws, nuts and washers to replace the gear cover and terminal board rivets.

HEATER SYSTEM CIRCUITS

DESCRIPTION

The heater blower motor is controlled by the blower switch. The blower switch is a four position switch; off, low, medium, and high. This switch controls the speed of the blower motor by connecting different resistances into the motor circuit, thereby dropping the voltage available to the motor.

The blower switch is located on the control assembly. The harness from the switch goes to the dash panel connector and into the engine compartment. The harness is then routed to the resistor block, which is located on the blower housing. From the resistor block, the harness then goes to the blower motor. The wire colors can be found in the wiring diagrams which are at the back of this manual.

DIAGNOSIS

For diagnosis of the heater blower circuit, refer to HEATING AND VENTILATION (SEC. 1A).

ON-VEHICLE SERVICE

For on-vehicle service of the heater blower circuit, refer to HEATING AND VENTILATION (SEC. 1A).

AIR CONDITIONING ELECTRICAL SYSTEM

DESCRIPTION

The compressor electro-magnetic clutch is turned on and off by the pressure sensing switch. When refrigerant pressure drops below a certain predetermined level, the switch opens the compressor clutch circuit, which causes the refrigeration system to stop working. The pressure sensing switch is located near the top of the accumulator.

DIAGNOSIS

For diagnosis of the A/C electrical system, refer to AIR CONDITIONING (SEC. 1B).

ON-VEHICLE SERVICE

For on-vehicle service of the air conditioning, refer to AIR CONDITIONING (SEC. 1B).

**FRONT LIGHT SYSTEMS**

The front lighting system includes the headlamps, the front parking lamps, and the front side marker lamps. The circuit starts at the fuse block and goes to the light switch in the instrument panel. From the light switch the circuit goes to the dash panel connector and then to the front lamps.

**HEADLAMP SYSTEM**

The headlamp system has two options. One option is two headlamps, each headlamp having a parking lamp located under it. The other option is four headlamps, with the parking lamps located in the grill. On the four headlamp option, when the low beam circuit is energized, only the upper headlamps will be on. When the high beam circuit is energized, only the lower headlamps will be on. Refer to figures 1, 2, 3, and 4.

HEADLAMP ADJUSTMENT (Figure 6)
Horizontal and vertical aiming of each headlamp is done by two (2) adjusting screws which move the mounting ring against the tension of the coil spring.
Some state and local authorities have specific requirements for aiming headlamps and these requirements should be followed.
Replacement of a headlamp will normally not require aiming adjustment. However, do check the aim.
Use the safety aimer J-6876-01 or equivalent. Instructions for using the safety aimer are supplied by the instrument manufacturer.

DIMMER SWITCH REPLACEMENT
Refer to STEERING COLUMNS (SEC. 3B4).
LAMP SWITCH REPLACEMENT
Refer to "Rear Lighting Systems."

FRONT PARKING LAMPS SYSTEM

DESCRIPTION
The front parking lamps circuit is in the headlamp harness. The circuit starts from the fuse block, goes to the lamp switch, and then forward to the front parking lamps. The circuit also includes the rear parking lamps, which are covered later in this section. The parking lamp system is turned on when the lamp switch is pulled out to the first detent.

FRONT SIDE MARKER LAMP SYSTEM

DESCRIPTION
The front side marker lamp circuit is included in the headlamp harness. The circuit starts at the lamp switch. It goes to the dash panel connector and out to the front side marker lamps. The circuit also branches at the lamp switch and goes to the rear side marker lamps. This part of the circuit is covered later in this section.

REPLACEMENT OF THE FRONT SIDE MARKER LAMP

Remove or Disconnect (Figures 8 and 9)

1. Two screws (32).
2. Side marker lamp (31).
3. Bulb (33) from the lamp (31).

REAR LIGHTING SYSTEMS

The rear lighting systems contain the circuits for the running, park, turn, stop and license lamps. One bulb may function for more than one circuit. The harness for the rear lighting systems starts at the fuse block, goes to the various switches and then back along the left frame to the various lamps.

REAR RUNNING LAMPS AND MARKER LAMPS

This circuit starts at the lamp switch. The lamps will be on when the lamp switch is in the first and second detents. The front park lamps and front marker lamps will also be on when the lamp switch is in the first detent.

REAR PARK LAMPS

These lamps will be on when the lamp switch is in the first detent. The front park lamps will also be on. The side marker lamps will also be on.

REAR TURN, STOP, AND HAZARD SYSTEMS

These three systems use the same bulb in the rear lamps. When the rear turn system is turned on, a thermal oscillator is turned on, which causes the system to flash. The front park lamps are also a part of the turn system.

The stop lamp system is turned on by a brake switch closing. The two rear bright lamps are then turned on.

The hazard system is turned on by the hazard switch. The hazard system thermal oscillator is then turned on.

**BACKUP LAMP SYSTEM**

This circuit is turned on when the transmission is shifted into reverse. The backup switch is closed, thus turning on the backup lamps. The backup lamps are located in the rear lamp assemblies.

The wiring circuits are protected from short circuits by a combination of fuses, circuit breakers, and fusible thermal links in the wiring itself. This greatly reduces the hazard of electrically caused fires in the vehicles.

The headlamp circuits are protected by a circuit breaker in the light switch. An electrical overload on the breaker will cause the lamps to go on and off, or in some cases to remain off.

In addition to a fuse, the windshield wiper motor is also protected by a circuit breaker. If the motor overheats, due to overloading caused by heavy snow, etc., the wipers will remain stopped until the motor cools.

Fuses located in the Junction Block beneath the dash on the drivers side are:

**DESCRIPTION**

**SPEEDOMETER**

The speedometer on the instrument panel is a mechanical type that is driven by a cased cable which is connected to the transmission. The speedometer is located in the center of the instrument panel. Refer to figure 1 for diagnosis.

**FUEL GAGE**

The fuel gage is an electrical, current sensing type of indicator. It has two coils in it. One coil sets up a constant magnetic field. The other coil has a varying magnetic field which is varied by the reostat attached to a float in the fuel tank. A magnet, attached to a pointer, is located between the two coils. The magnet will establish a position which is controlled by the magnetic fields of the two coils. Refer to figure 2 for diagnosis.

**OIL PRESSURE GAGE**

The oil pressure gage displays the engine oil pressure. The gage is electrical. The sender is a variable resistance which controls the current passing through the gage. Refer to figure 3 for diagnosis.

**TEMPERATURE GAGE**

This gage displays the temperature of the engine coolant. It is an electrical gage. The gage's sender is a variable resistance that controls the current passing through the gage. Refer to figure 4 for diagnosis.

**ENGINE CONTROL**

**IGNITION SWITCH**

On the RV and G models, the ignition switch is located in the steering column on the right hand side just below the steering wheel. The electrical switching portion of the assembly is separate from the key and lock cylinder. However, both are synchronized and work in conjunction with each other through the action of the actuator rod assembly.

For a complete explanation of the key and lock cylinder, and the actuator rod assembly, refer to STEERING COLUMN, (Sec. 3B4).

The ignition and starting switch is key operated through the actuator rod assembly to close the ignition primary circuit and to energize the starting motor solenoid for cranking.

On the P models the ignition switch is located on the instrument panel. The switch controls the engine run and start functions, and the accessories.

The connections to the ignition switch are shown in the Wiring Diagrams Booklet. The charts included on the diagrams show how the switches are internally connected in each switch position.

**LAMP SWITCH**

The lamp switch controls the headlamps, marker lamps, running lamps and parking lamps. The switch also controls the dome lamps and the light level of the instrument illumination lamps.

ON VEHICLE SERVICE

SPEEDOMETER REPLACEMENT

Servicing of the speedometer assembly should only be performed by trained technicians having the proper test equipment.

When replacing a speedometer or odometer assembly, the law requires the odometer reading of the replacement unit to be set to register the same mileage as the prior odometer. If the same mileage cannot be set, the law requires the replacement odometer be set to zero and a label be installed on the driver’s door frame to show the previous odometer reading and the date of replacement.

## CRUISE CONTROL

### DESCRIPTION

Cruise control is a speed control system which maintains a desired vehicle speed under normal driving conditions. However, steep grades up or down may cause variations in the selected speeds. The electronic cruise control system has the capability to cruise coast, resume speed, accelerate, and “tap-up” and “tap-down” (figure 1).

The main parts of the cruise control system are the mode control switches, controller (module), servo unit, speed sensor, vacuum supply, electrical and vacuum release switches, and electrical harness.

The cruise control system uses vacuum to operate a throttle servo unit. The servo unit maintains a desired

![Figure 1—Multi-Function Lever](image)
vehicle speed by trapping vacuum in the servo unit at the proper servo position. The controller monitors vehicle speed and servo position and operates the vacuum and vent valves in the servo to maintain desired speed. The controller contains a low speed limit which will prevent system engagement below a minimum speed, about 25 mph. The operation of the controller is controlled by mode control switches located in the end of the directional signal lever. To disengage the system, two release switches are provided. An electrical release switch mounted on the brake pedal bracket (and clutch pedal bracket on vehicles equipped with manual transmission) disengages the system electrically when the brake pedal (or clutch pedal) is depressed. A vacuum release valve, mounted on the brake pedal bracket, vents the trapped vacuum in the servo to atmosphere when the brake pedal is depressed, allowing the servo unit to quickly return the throttle to idle position.

**ELECTRONIC CONTROLLER (MODULE)**

The controller interprets the position of the servo, the position of the mode control switches and the output of the speed sensor. In response to these inputs, the controller electrically signals the opening or closing of the vent and vacuum solenoid valves in the servo (figure 2).

The controller is usually mounted on the accelerator pedal bracket. For mounting location, refer to the On-Vehicle Service portion of this section.

**SERVO UNIT (Figure 3)**

The servo consists of a vacuum operated diaphragm, a normally open solenoid valve to vent the diaphragm chamber to atmosphere, a normally closed solenoid valve to connect the diaphragm chamber to the vacuum source, and a variable inductance position sensor. The servo operates the throttle in response to signals from the electronic controller as follows:

- **Steady Cruise State** (system engaged and operating) — Both vacuum and vent valves are closed or sealed. The servo has a constant vacuum on the diaphragm and places no-flow requirements on the vacuum source. Vacuum is trapped in diaphragm chamber.
- **Vehicle Losing Speed** (due to steep grades or driver wishes to increase speed by operating mode control switches) — The controller energizes the vacuum solenoid to open the vacuum valve to the vacuum source. This increases the vacuum level in the servo to increase the throttle opening. The vent remains closed.
- **Vehicle Gaining Speed** (due to steep grades or driver wishes to decrease speed by operating mode control switches) — The controller de-energizes the vent solenoid to open the vent valve to the atmosphere which reduces vacuum in the servo and allows the throttle return spring to decrease the throttle opening. The vacuum valve remains closed.

When the cruise system is engaged and operating (without any interference from the driver via the mode control switches), no speed correction will be made until the vehicle exceeds approximately ± 1/4 mph of set speed.

When the controller senses an over or underspeed condition it will pulse the opening of the vent or vacuum valve. The average duration of one pulse will be 10 milliseconds. The pulse will be repeated, as required, until the speed correction required brings the vehicle to the set speed. From any set speed, under normal road load conditions, the vacuum valve will remain in a completely open position when vehicle speed has dropped 5 mph below set speed. Likewise, when vehicle speed has exceeded 3 mph over the set speed, such as down a steep grade, the vent will go into constant open position.

The servo incorporates a steel core which moves within a coil. Its resulting variable inductance provides a continuous (voltage) servo position signal to the controller. This voltage signal is constantly compared to the vehicle speed signal. This comparison determines if the pulses issued have corrected the speed error or if additional pulses are required. This comparison is also used to lengthen the average pulse when it is not enough to compensate for the speed error, such as a steep grade.

The servo will go into an open vent valve position under the following conditions:
- When the brake (or clutch) pedal is depressed.
- An open variable inductance position sensor coil in the servo.
- A loss of electrical power to the system.
- The ignition is turned off.

**SPEED SENSORS**

**VSS Buffer Amplifier (Figure 4)**

This is the device that will supply the vehicle speed input to the controller. The optic head portion of the vehicle speed sensor (VSS) is located in the speedometer frame. A reflective blade is attached to the speedometer cable/thead assembly. The reflective blade spins like a propeller, with its blades passing through a light beam from a L.E.D. in the optic head. As each blade enters the L.E.D. light beam, light is reflected back to a photocell in the optic head causing a low power speed signal to be sent to a buffer for amplification and signal conditioning. This amplified signal is then sent to the controller.

**VACUUM SUPPLY**

The vacuum supply to operate the cruise control system is routed to the servo. This can be done by routing manifold vacuum straight to the servo or from manifold through a vacuum storage tank.

**ELECTRICAL AND VACUUM RELEASE SWITCHES**

These switches are used to disengage the cruise control system. An electrical release switch mounted on the brake pedal bracket (and clutch pedal bracket on vehicles equipped with manual transmission) disengages the system electrically when the brake (or clutch) pedal is depressed. This is done by interrupting the flow of current to the controller. A vacuum release valve, mounted on the brake pedal bracket vents the trapped vacuum in the servo to atmosphere when the brake pedal is depressed, allowing the servo unit to more quickly retain the throttle to idle position. This is done by routing a separate hose directly to the servo from the normally closed vacuum switch. These two types of switches will also sometimes be combined with stop light switch, TCC (Torque Converter Clutch) switch, etc. Refer to Automatic Transmission (Sec. 7A) On-Vehicle Service in this section.

**RADIO**

**DESCRIPTION**

For operation of the factory installed standard and optional radios available, refer to the Owner's Manual or radio supplement supplied with the vehicle.

The receiver is mounted using the front support tubes surrounding the control shafts, and a rear support bracket. The front support tubes are secured with nuts. The rear support bracket is secured with a screw.

The power, antenna, and speaker harnesses connect to the rear of the receiver.

Depending on the system, the speakers can be mounted at the center or end of the dash, in the side panels or in the rear corners of the cab.

The antenna may be mounted in the windshield, or on the right front corner of the vehicle.

**DIAGNOSIS**

Since radio problems are most often repaired at authorized warranty repair stations, the tendency is to remove the set when a problem is reported, without any preliminary diagnosis. This results in a large number of radios showing up as "NO TROUBLE FOUND" units when received by the warranty repair stations. Many times, when this is the case, the trouble usually could have been corrected without removal of the radio, such as noise complaints.

The inconvenience of driving without a radio, while the set is being serviced at a warranty repair station, can frequently be avoided if the following quick checks are used to eliminate external radio system problems before removing the radio for repair:

- Test the radios outside, with the hood down.
- Most noise can be found on weak "AM" stations near the low frequency and end of the band.
- Ignition noise on FM indicates a possible faulty HEI system.
- If a test antenna is used, ground the base to the car body and DO NOT HOLD THE MAST.
- 90% of the noises enter via the antenna.
- A small amount of ignition noise may be normal when the HEI is located near the cowl (windshield antennas only).
- Coated screws or bolts CAN act as a poor ground.
- Windshield antennas are more prone to noise and station directivity.
- Most hoses are conductive unless they have a white stripe.
- When shielding the dash, wire, hose, etc., use foil or screen and ground it.
- Weak or fading "AM" is often caused by improperly adjusted antenna trimmer (when present).

Always determine the exact nature of the radio problem as an aid to diagnosis. Knowing whether the condition is intermittent or constant, whether it occurs with engine off or running, and whether it occurs with car stationary or moving, will help to pinpoint the problem. Use Chart 1 to isolate radio problems, then proceed to the diagnostic charts.

**ACCESSORY NOISE**

**BLOWER MOTOR NOISE (Figure 32)**

Install a blower motor feed through capacitor. Attach one end to the blower motor and the other end to the hot lead from the blower motor switch. Also, ground the capacitor ground tab.

**BLOWER SWITCH POP (HIGH SETTING TO OFF)**

Install a diode (diode number IN4001, or the equivalent diode to withstand a 50V inverse peak voltage) from the high speed switch wire (orange) to ground on the high speed blower relay under the hood.

**BRAKE SWITCH POP**

Install a 0.5 MFD capacitor between the two wires going to the brake switch at the brake pedal. Also, install a 0.5 MFD capacitor from the 14V lead to ground at the brake switch.

**CLICKING OR POPPING NOISE (DIESEL ENGINE)**

1) The problem will sound similar to ignition noise. However, it won't vary with engine speed. Also the noise will most likely be noticeable only in the idle condition.

2) The noise is being generated by the high vacuum switch in the EGR assembly (figure 34).

3) Check the system for any vacuum leaks and repair.

4) If the noise still remains, change the EGR control assembly.

**CRUISE CONTROL POP (TRANSUDER TYPE)**

For cruise control engage and disengage pops, install a 0.5 MFD capacitor from the hold line at the transducer to ground. If disengage pops are still present, splice a 0.5 MFD capacitor across the contacts of the disengage switch at the brake pedal.

**HORN BLOW-THRU NOISE OR HASH (STATIC IN RADIO SPEAKERS WHEN USING HORN)**

Splice blower motor capacitors into each lead. Install the capacitors as close to the horn as possible. Ground the case of the capacitor to chassis ground using the metal ground tab on the capacitor. The technician should solder all connections instead of using quick connects.

TAPE PROBLEM

INTERMITTENT
Determine if radio is intermittently weak, dead or noisy, then refer to appropriate radio chart.
Check for the noise in each of the following three positions:
1. Accessory (all electrical accessories OFF)
2. Igniton on (engine NOT running)
3. Engine started

If the noise is ONE switch pop, go immediately to the ACCESSORY NOISE chart. For MORE THAN one switch pop, go to the ANTENNA chart.

If the noise occurs in position 1, substitute a known good radio. If it plays fine, send the faulty unit to an authorized repair shop.

If the noise occurs in position 2, it is possibly related to the ECM or digital dash. Go to the ECM OR DIGITAL DASH NOISE chart.

If the noise occurs in position 3, continue on this chart.

Measure the ground from the case of the radio to the accelerator mounting bracket, using the LOWEST scale on a digital ohmmeter.

Less than 0.2 Ohms
Good Ground
Noise Remains

Unplug antenna from the back of the radio and check for the noise.

Noise Eliminated
Noise Remains

Go to the ANTENNA Chart.

Greater than 0.2 Ohms
A poor ground exists. Cut the ground (black) wire from the black plug at the back of the radio. Attach a braided ground strap from the case of the radio steering column.

Noise eliminated.

Figure 22—Chart 2 (Noisy Part 1)
CHART 3
NOISY - PART 2

With radio powered up and all speakers and antenna connected, slowly pull radio in and out of the instrument panel and check for noise.

Noise eliminated when out.

With radio powered up and all speakers and antenna connected, slowly pull radio in and out of the instrument panel and check for noise.

Noise remains either way.

Noise is entering on one of the power lines - ignition or memory. (Memory line is used only with ETR's).

Install a 1224205 filter package on the ignition line. Try the black wire of the filter package connected and disconnected, and use whichever works better.

Noise remains.

Noise eliminated.

Install a 1224205 filter package on the memory line. ETR's are the only radios with memory lead. (Memory lead is orange wire in the two or three wire connector).

Noise remains.

Noise eliminated.

Determine which of the following three noises is present and suppress the noise at the source, using information from the appropriate chart.

REFER TO IGNITION NOISE

Ignition noise may be identified as a "bacon frying" or constant popping noise that varies with engine RPM.

REFER TO ALTERNATOR WHINE

Alternator whine may be identified as a siren type noise or high pitched whine that varies with engine RPM.

REFER TO ACCESSORY NOISE

Accessory noise may be identified as a turn-on "pop" or a blower motor noise.

Figure 23—Chart 3 (Noisy Part 2)
Try the following fixes in the given order:
1. Install a 1224205 filter package to the ignition power line (pink and black wire) of the ECM. The black wire of the filter package should face away from the ECM. The filter should be tried with the filter's black lead grounded and ungrounded to determine best results. The black wire of the filter must face away from the ECM.
2. Install a 1224205 filter package to the memory lead (orange wire, terminal R) of the ECM. Again, face the black wire of the 1224205 away from the ECM.
CHART 5
IGNITION NOISE

Determine the source of the ignition noise.

1 or 2 cylinders.

Try the following fixes in the given order:
1. Check for loose or defective spark plug wire.
2. Reroute spark plug wires laying against anything that could possibly transmit noise to the radio (wiring or sensor leads that travel into the passenger compartment).
3. Check for faulty spark plug.
4. Replace distributor cap and rotor.

All cylinders.

Try the following fixes in the given order:
1. Check the ground from engine to bulkhead; install a braided ground strap if necessary.
2. Install a braided ground strap on the hood.
3. Check heater core ground; clean or install braided ground strap if necessary.
4. Check air conditioner accumulator ground; clean or install a braided ground strap if necessary.
5. Move all wiring away from HEI and spark plug wires.
6. Inspect HEI for the following and replace if necessary:
   - Distributor cap carbon ball eroded away, or cracked or loose cap.
   - A rotor with burned black spot on wiper or pits in wiper surface.
   - A faulty coil.
   - An oily film on some of the lead terminals or inside the cap.
   - Faulty HEI module; can cause ignition noise on FM only.

CHART 6
ANTENNA NOISE - PART 1

Windshield antenna

Plug antenna back into the radio.

Use a sniffer to locate from which part of the dash the noise is being generated.

Noise eliminated.

After locating the area of the dash where the noise is being generated, the following fixes are possible.

Windshield antenna

Place aluminum foil over the entire dash top and ground it with clip leads to each door and jam switch.

Noise remains.

Unplug antenna at the cowl.

Noise remains.

Noise eliminated.

Check the mounting (ground) connections of the cowl shield. It must be grounded.

Measure ground from lead-in shield (at radio end of lead-in) to good ground, using lowest scale on a digital ohmmeter.

Greater than 0.2 Ohms

Good ground.

Less than 0.2 Ohms

Ground the hood with a short ground strap from the cowl. (Scrape the surface around the mounting holes for good contact).

Check antenna lead-in screws at cowl. Scrape area and install "shiny" screws to insure a good ground.

Greater than 0.2 Ohms

Replace the antenna lead-in.

Less than 0.2 Ohms

Again measure ground from the antenna lead-in shield to a good ground.

Supress the noise at the source using the appropriate chart: IGNITION NOISE, ALTERNATOR WHINE, ACCESSORY NOISE.

Line the underside of the dash with aluminum tape. the tape MUST BE GROUNDED.

If a "noisy" wire or cable can be located with the sniffer, re-route it or ground the shield of any "noisy" cable.

If all else fails, installing an outside antenna will often eliminate the customer's complaint.

Suppress the noise at the source using the appropriate chart: IGNITION NOISE, ALTERNATOR WHINE, ACCESSORY NOISE.

Figure 26—Chart 6 (Antenna Noise Part 1)
**CHART 7**

**ANTENNA NOISE - PART 2**

- **Fixed or Power Mast Antenna**
  - Poor Ground
    - Measure the antenna ground from the antenna shield to the ground at back of the radio using lowest scale on a digital ohmmeter.
    - Greater than 0.2 Ohms
      - Disconnect and clean all the RF connections. Check for a good ground at the antenna:
        1. Trim ring
        2. Mounting brackets
      - If poor ground exists (greater than 0.2 ohms resistance), run a braided ground strap from base of antenna mast to battery ground.
    - Noise eliminated.
    - Less than 0.2 Ohms
      - Replace defective antenna.

- **Good Ground**
  - Less than 0.2 Ohms
    - Try using a test antenna. The base must be grounded. Also, the antenna should be held by the base and NOT the mast.
    - Noise Remains

- **Fixed Mast**
  - Determine the type of antenna.
  - Power
    - Disconnect the inline RF connector under the hood. Measure the resistance from mast to center conductor pin of the lead-in.
    - Greater than 0.2 Ohms
      - Replace Antenna System
    - Less than 0.2 Ohms
      - Using lowest scale on ohmmeter, measure resistance from mast to ground.
      - Measureable Resistance
        - Replace defective lead-in.
      - Open (Infinite Resistance)
        - Suppress the noise at the source using the appropriate chart: IGNITION NOISE, ALTERNATOR WHINE, ACCESSORY NOISE.
AM and FM weak or only AM is weak.

Trim the Antenna*
See Procedure Below

Radio Works
STOP

Won’t trim or still weak.

Check the antenna system with a test antenna.

Still Weak

Remove the Radio

Return to Normal

Repair the antenna system. Retrim.

Only FM is weak

Compare the FM reception to another car with an FM radio. Tune into a weak station.

Customer’s radio has considerably weaker reception.

Both radios have relatively similar reception capabilities.

Remove the Radio.

Explain to the customer that the radio is normal.

*ETR and 2000 series radios do not have an antenna trimmer. Try a substitute antenna.

ANTENNA TRIMMER ADJUSTMENT

The antenna trimmer adjustment matches the antenna coil in the radio to the antenna. Only AM radios, or the AM part of AM/FM radios, need this adjustment. (ETR models and all 2000 series radios use "self adjusting" circuits, and do not have an antenna trimmer).

1. Tune the radio to a weak AM station or noise near 1400 kHz. Turn the volume all the way up. You should barely hear the station.

2. Remove the right inner and outer knobs.

3. Use a small screwdriver to adjust the trimmer screw. Adjust the screw for the loudest volume.

4. Reinstall the control knobs.

Figure 28—Chart 8 (Weak)
Try the following fixes in the given order:

1. Install a 250 MFD, 100V capacitor on the alternator output lead and/or the brown field wire of the alternator to ground.

2. Exchange radio with a known good radio. If this eliminates the noise, send the faulty radio to an authorized repair shop.

3. Dedicated ground for the radio receiver. Cut the black wire of the black plug in back of the radio. Attach a braided ground strap from the case of the radio to a good chassis.

4. Run a wire directly from the positive battery terminal to the alternator.

5. Replace the alternator.

DEAD

Check the radio.
Check to see if all speakers are dead.
(Use fader to check.)

Test the speakers.

Using an ohmmeter, measure from all 8 speaker terminals of blue and white plugs at the back of radio, to ground.

- All open
- One or more shorted

Measure across each speaker (A-C, B-D, etc.).

- Open or Shorted
- Replace speaker or repair connection.

Always open
- Repair or replace harness. Recheck radio.

    - Remove the obstruction. Caution: Improper removal may damage the tape player.*
    - **Dead.**
      - Remove the radio for repair.
  - **No obstruction.**
    - **Works.**
      - Substitute a known good tape cartridge.
  - **Inform the customer to use a good quality tape.**

*NOTE: Jammed tape cannot be removed from the search and repeat tape deck. Send the radio to authorized repair shop.

---

**CLEANING PARTS OF TAPE PLAYER TO REDUCE TAPE NOISE**

There are two parts that you clean on a tape player: the head and the capstan. Since you can reach them through the tape door, you can leave the tape player in the car.

To clean the head and capstan, use a cotton swab dipped in ordinary rubbing alcohol. Wipe the head and capstan as shown.

Figure 31—Chart 11 (Tape)
HORN SWITCH POPS (Figure 36 and 37)
1) Install a 0.5 MFD capacitor between the switched 14 volt lead and horn lead at the horn delay.
2) If pop persists, install a 0.5 MFD capacitor from the switched 14 volt lead of the horn relay to ground and a 0.5 MFD capacitor from the horn lead to ground.

MIXTURE CONTROL SOLENOID POPPING
Complaint:
A popping noise which sounds like ignition noise occurring on the AM band. This noise will NOT vary with engine speed. Also this noise should be noticeable with the ignition “on”, and engine “off”, but not in “accessory” position.

Problem:
Noise is being radiated from the mixture control solenoid duty cycle lead to the ALDL connector.

Fix:
1) Located the breakout harness extending from the main harness, about six inches from the ECM harness connector.
2) Located the light blue wire. It should connect to Pin D on the 15 pin breakout connector.
3) Cut the light blue wire on the vehicle side of the connector at the connector.
20. To the horn switch (steering column)  
21. Horn relay.  
22. Power (fused 14 volts)  
23. .5 MFD capacitor  
24. To the horns.  

**Figure 37—Horn Switch Capacitor**

**REAR DEFOGGER NOISE OR HASH**  
A broken grid in the defogger in the rear glass may cause a "hash" in the radio. Repairing this break will eliminate the noise. A break in the rear defogger grid can be found by touching each "line" of the grid while the rear defogger is on. The cold grid is the one broken.

**TACHOMETER NOISE**  
Locate the wire from the distributor cap to the tachometer and shield the wire by wrapping it with aluminum tape. The tape must also be connected to a good ground.

**TORQUE CONVERTER LOCK-UP NOISE**  
**Model:**  
Diesel Engines  
**Complaint:**  
Hash or popping noise on "AM" band after torque converter "lock-up" (35-45 mph).  
**Fix:**  
1) Install a 1224205 filter package in series with green lead on the VRV switch (see the instructions in filter package). For this application, connect the ground lead in the filter package to the blue lead on the VRV switch, instead of to ground.  
   Install a capacitor (0.5 MFD) from the blue lead on VRV switch to ground.  
2) Install a 220 MFD capacitor rated at 50 VDC across the VRV switch between the green and blue wires.  

**Figure 38—Torque Converter Lock Up Noise**

**WIPER SWISH WINDSHIELD ANTENNA**  
The swish sound encountered when the wipers pass over the windshield antenna is due to a static buildup between the windshield and the wiper. Try cleaning the windshield with Opticlean or add a tablespoon of dish soap to the washer bottle.

**OTHER ELECTRIC MOTOR NOISES (POWER WINDOWS, BLOWER MOTORS)**  
Install a 0.5 MFD capacitor rated at 50 VDC across each motor.

**OTHER SWITCH POPS (BLOWER SWITCHES, POWER LOCKS, POWER MIRRORS, PARK - NEUTRAL SWITCH, POWER WINDOWS, WIPERS, REAR WINDOW DEFOGGER)**  
Install a 0.5 MFD capacitor rated at 50 VDC across the contacts of the switch, from the hot side of the switch to ground or both.
The sniffer is made from an old piece of antenna lead-in from a mast or power antenna. The longer the lead-in the better, since it will make the sniffer more flexible as a diagnostic tool.

Make the sniffer as shown in figure 39. The 50 mm (2 in) section with the black coating and braided shield stripped back becomes the antenna when the sniffer is plugged into the radio's antenna socket. It can then be used to probe and search out "Hot Spots".

Procedure:
1. While listening to the complaint noise, disconnect the antenna and plug the sniffer into the antenna socket.
2. Turn the radio volume up.
3. When searching for the noise source, keep fingers off of the probe, otherwise erroneous results will be received.

When checking for noise on a wire, the best results will be achieved when the sniffer is placed parallel to the wire. The sniffer can also be used to determine from what area of the dash the noise is being generated onto a windshield antenna.

The sniffer can also be used to locate "Hot Spots" between the windshield and the hood that may be directing noise onto the windshield antenna.

It must be noted that the sniffer will also locate "normal" hot spots. However, the technician who becomes familiar with the sniffer's capabilities will find it the most useful diagnostic tool in noise suppression work.

### SECTION 10A1

**DOORS**

NOTICE: Door lock striker system fasteners are important attaching parts in that they could affect the performance of vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of these parts.

**DOOR AND HINGE REPLACEMENT**

**Remove or Disconnect (Figure 1)**
- Open the door.
- Electrical wiring harness (if equipped).
  - Refer to "Door Trim Panel Replacement," for access to the wiring harness.
  - Mark the position of the hinges on the door.
- Door hinge to door bolts (4).
- Door from the vehicle.
  - Mark the position of the hinges on the body side pillar.
- Hinge to door pillar bolts (6).
- Door pillar to hinge bolt (7).
- Hinges from the vehicle.

**Install or Connect (Figure 1)**
1. Hinges to the vehicle.
   - Align the hinges to the marks on the body side pillars.
2. Hinge to door pillar bolts (6).
3. Door pillar to hinge bolt (7).
4. Door to the vehicle.
   - Align the marks on the door to the hinges.
5. Door hinge to door bolts (4).
6. Electrical wiring harness (if equipped).
   - Refer to "Door Trim Panel Replacement," for access to the wiring harness.

**DOOR ADJUSTMENT**

**Remove or Disconnect (Figures 2 and 3)**
- Pry the top of the panel away from the door side window seal clips.

**Install or Connect (Figures 2 and 3)**
- Pry the top of the panel away from the door side window seal clips.

**DOOR TRIM PANEL REPLACEMENT**

**Remove or Disconnect (Figures 4 and 5)**
- Check that all the trim retainers are securely fastened, and are not damaged. Replace any damaged fasteners.
1. Door trim panel onto the door side window seal clips.
2. Door trim retainers into the door panel.
3. Door trim panel to door screws (22).

18. Inside Handle

A. Push the tool in the direction of the arrow.
Remove or Disconnect (Figure 6)
- Place the window in the lowered position.
  1. Door trim panel. Refer to "Door Trim Panel Replacement."
  2. Run channel molding.
    - Pull the molding out of the vent assembly only.
  3. Door panel to run channel bolt (31).
  4. Door to ventilator screws (26) and spacers (27).

Install or Connect (Figure 6)
  1. Door vent/window run channel assembly to the vehicle.
    - Rotate the vent assembly into the door.
    - Fit the assembly into the door frame.
  2. Door to ventilator screws (26) and spacers (27).
    - Start with the screw at the top of the door, and work downward.
  3. Door panel to run channel bolts (31).
  4. Run channel molding.
    - Seat the clip into the vent, then push the remainder of the molding into the run channel.
  5. Door trim panel. Refer to "Door Trim Panel Replacement."

VENT GLASS REPLACEMENT

CAUTION: Always wear heavy gloves when handling glass to minimize the risk of injury.

REMOVAL (Figure 6)
  1. Open the vent window.
  2. Squirt solvent on the tar-paper-like filler all around the glass channel, on both sides of the glass.
  3. When the filler and sealer soften, pull the glass and the old filler from the channel.

INSTALLATION (Figure 6)
  1. Thoroughly clean the inside of the glass channel with sandpaper to remove all rust and foreign matter.
  2. Cut the new piece of glass channel filler 51 mm (2-inches) longer than required.
  3. Position the filler (soap stoned side away from the glass) evenly around and over the edge of the glass that will be inserted in the channel. Press the filler firmly onto the edge of the glass to ensure a good
DOORS 10A1-7

Figure 7—Vent Window Adjustment

bond. (Usually this is done with a mechanical window press.) Squeeze together the doubled ends of the filler which project beyond the edge of the glass.

4. Brush the inner channel with soap solution. DO NOT USE GREASE OR OIL.

5. Press the glass and the filler into the channel until firmly seated.

6. Trim off excess filler material around, and at the end of the channel.

VENT WINDOW ADJUSTMENT

Adjust (Figure 7)

1. Remove the door trim panel. Refer to “Door Trim Panel Replacement.”

2. Bend the tabs on the adjustment nut away from the nut.

3. Adjust the vent by placing a wrench on the adjusting nut, and then turning the vent window to the proper tension.

4. Bend the tabs over the adjustment nut.

5. Install the door trim panel. Refer to “Door Trim Panel Replacement.”

DOOR WINDOW REPLACEMENT

Remove or Disconnect (Figure 8)

CAUTION: Always wear heavy gloves when handling glass to minimize the risk of injury.

- Lower the glass to the bottom of the door.

1. Door trim panel. Refer to “Door Trim Panel Replacement.”

2. Door vent/window run channel assembly. Refer to “Door Vent/Window Run Channel Assembly Replacement.”

- Mask or cover any sharp edges that could scratch the glass.

3. Door window glass.

Figure 8—Window Assembly Components

- Slide the glass forward until the front roller is in line with the notch in the sash channel. Disengage the roller from the channel.

- Push the window forward, then tilt it up until the rear roller is disengaged.

- Place the window in a level position, and raise it straight up and out of the door.

Install or Connect (Figure 8)

1. Door window glass.

- Lower the window into the door frame.

- Push the window forward, then tilt it up, and slide the rear roller into the sash channel.

- Slide the glass backward until the front roller is in line with the notch in the sash channel. Engage the roller to the sash channel.

- Slide the glass rearward into the glass run channel.

- Remove any masking or covering.

2. Door vent/window run channel assembly. Refer to “Door Vent/Window Run Channel Assembly Replacement.”

3. Door trim panel. Refer to “Door Trim Panel Replacement.”
INNER WINDOW WEATHERSTRIP REPLACEMENT

**Remove or Disconnect (Figure 9)**
1. Door trim panel. Refer to "Door Trim Panel Replacement."
2. Weatherstrip (37) from the trim panel.
   - Pry the clips on the weatherstrip from the trim panel shoulder.

**Install or Connect (Figure 9)**
1. Weatherstrip (37) to the trim panel.
   - Push the weatherstrip clips onto the trim panel shoulder.
2. Door trim panel. Refer to "Door Trim Panel Replacement."

OUTER WINDOW WEATHERSTRIP REPLACEMENT

**Remove or Disconnect (Figure 10)**
- Lower the window.
- Weatherstrip (38) from the door.
  - Pry the weatherstrip clips from the door panel.

**Install or Connect (Figure 10)**
- Weatherstrip (38) to the door.
  - Push the weatherstrip clips onto the door panel.

REAR GLASS RUN CHANNEL REPLACEMENT

**Remove or Disconnect (Figure 11)**
1. Door trim panel. Refer to "Door Trim Panel Replacement."
   - Lower the window completely.
2. Inner and outer window weatherstrips.
3. Door to run channel bolts (41).
4. Run channel from the vehicle.
   - Pull the run channel upwards while twisting to clear the lower bracket.

**Install or Connect (Figure 11)**
1. Run channel to the vehicle.
   - Work the run channel into the door frame. Be certain that the glass is in the channel.
2. Lower door to run channel bolt (41).
3. Upper door to run channel bolt (41).
4. Inner and outer window channel bolt (41).
5. Door trim panel. Refer to "Door Trim Panel Replacement."
Figure 12—Manual Window Regulator

WINDOW REGULATOR REPLACEMENT

MANUAL REGULATOR

Remove or Disconnect (Figure 12)

- Raise the window and tape the glass in the full up position using cloth body tape.
1. Door trim panel. Refer to "Door Trim Panel Replacement."
2. Door panel to regulator bolts (42).
3. Window regulator.
   - Slide the regulator rearward to disengage the rear roller from the sash channel. Also disengage the lower roller from the regulator rail.
   - Disengage the forward roller from the sash channel at the notch in the sash channel.
   - Collapse the regulator, and remove it through the access hole in the door.

Install or Connect (Figure 12)

- Lubricate the regulator and the sash and regulator rails with lubriplate or equivalent.
1. Window regulator.
   - Collapse the regulator, and insert it through the access hole in the door.
   - Unfold the regulator, and engage the forward roller to the sash channel at the sash channel notch.

Figure 13—Power Window Regulator

- Slide the regulator rearward to engage the rear roller to the sash channel. Also engage the lower roller to the regulator rail.
- Slide the regulator into its proper position, and insert the regulator drive through the door panel.
2. Door panel to regulator bolts (42).
3. Door trim panel. Refer to "Door Trim Panel Replacement."
   - Remove the tape from the window.

POWER REGULATOR

For the diagnosis of power window circuits, refer to CAB ELECTRICAL (SEC. 8A).

Remove or Disconnect (Figures 12 and 13)

- Raise the window and tape the glass in the full up position using cloth body tape.
1. Battery ground cable.
2. Door trim panel. Refer to "Door Trim Panel Replacement."
3. Remove control to door trim panel bolts.
   - Lay the control aside.
4. Regulator to door panel bolts (45) and nuts (44).
5. Wiring harness from the regulator.
6. Window regulator.
   - Slide the regulator rearward to disengage the rear roller from the sash channel. Also disengage the lower roller from the regulator rail.
   - Disengage the forward roller from the sash channel at the notch in the sash channel.
   - Collapse the regulator, and remove it through the access hole in the door.
CAUTION: The next step must be performed when the regulator is removed from the door. The regulator lift arms are under tension from the counterbalance spring and can cause serious injury if the motor is removed without locking the sector gear in position.

- Drill a hole through the regulator sector gear and back plate. Drill the hole at least 12.7 mm (¼-inch) away from the edge of the sector gear or back plate. Install a pan head sheet metal tapping screw at least 19 mm (⅝-inch) long into the drilled hole to lock the sector gear in place.

7. Motor to regulator attaching bolts (28).
8. Motor from the regulator.

Install or Connect (Figures 12 and 13)
- Lubricate the motor drive gear and regulator sector teeth.
1. Regulator motor to regulator.
   - The motor pinion gear teeth must mesh properly with the sector gear teeth before installing the motor to regulator screws.
2. Regulator motor to regulator bolts (28).
3. Window regulator to the door.
   - Collapse the regulator, and insert it through the access hole in the door.
   - Unfold the regulator, and engage the forward roller to the sash channel at the sash channel notch.
   - Slide the regulator rearward to engage the rear roller to the sash channel. Also engage the roller to the regulator rail.
   - Slide the regulator into its proper position.
4. Wiring harness to the regulator.
5. Regulator to door panel bolts (45) and nuts (44).
6. Remote control to door trim panel bolts.
7. Door trim panel. Refer to “Door Trim Panel Replacement.”
8. Battery ground cable.
   - Remove the tape from the window.

DOOR LOCK REPLACEMENT

Remove or Disconnect (Figure 14)
- Raise the window completely.
1. Door trim panel. Refer to “Door Trim Panel Replacement.”
2. Inside door handle to lock rod clips (49).
   - Using a flat bladed screwdriver, push on the top of the clip where it is connected to the rod. Pivot the clip away from the rod.
3. Inside door handle to lock rod from the lock.
4. Outside door handle to lock rod clip.
   - Use the procedure given under step 2.
5. Outside door handle to lock rod from the lock.
6. Inside door lock knob.
7. Door to lock assembly screws (52).
8. Lock assembly from the door.

Figure 14—Door Lock Components
- Tilt the lock assembly away from the outside lock cylinder. Pull the lock assembly downward to make clearance for the inside lock rod.

Install or Connect (Figure 14)
1. Lock assembly to the door.
   - Align the inside lock rod to the hole in the door panel. Tilt the lock assembly onto the outside lock cylinder.
2. Door to lock assembly screws (52).
3. Inside door lock knob.
4. Outside door handle to lock rod onto the lock assembly.
5. Clip onto the lock rod.
   - Pivot the clip up and onto the lock rod.
6. Inside door handle to lock rod onto the lock assembly.
7. Clip onto the lock rod.
   - Pivot the clip up and onto the lock rod.
8. Door trim panel. Refer to “Door Trim Panel Replacement.”

POWER DOOR LOCK MOTOR REPLACEMENT

Refer to CAB ELECTRICAL (SEC. 8A) for electrical diagnosis of the door lock motor.

Remove or Disconnect (Figure 15)
1. Battery ground cable.
2. Door trim panel. Refer to “Door Trim Panel Replacement.”

- 4. Door to motor screws (78).
- 5. Motor from the lock rod.
  - Slide the rubber mount at the top of the motor off of the door lock rod.
- 6. Motor from the door.

Install or Connect (Figure 15)

1. Motor into the door.
2. Motor to the lock rod.
  - Slide the rubber mount at the top of the motor onto the door lock rod.
3. Door to motor screws (78).
4. Electrical connector to the motor.
5. Door trim panel. Refer to "Door Trim Panel Replacement."
6. Battery ground cable.

DOOR OUTSIDE HANDLE REPLACEMENT

Remove or Disconnect (Figure 16)

- Raise the window completely.
1. Door trim panel. Refer to "Door Trim Panel Replacement."
2. Outside door handle to lock rod clip.
  - Using a flat bladed screwdriver, push on the top of the clip where it is connected to the rod. Pivot the clip away from the rod.
3. Outside door handle to lock rod from the lock.
4. Door to outside handle screws (54).

Install or Connect (Figure 16)

1. Lock cylinder with gasket to the door.
  - The cylinder rod must engage the lock assembly lever.
2. Lock cylinder (62) retaining clip onto the cylinder.
3. Door trim panel. Refer to "Door Trim Panel Replacement."

Figure 16—Outside Handle and Lock Cylinder Components

5. Handle with the control rod from the door.
6. Gaskets from the door.

Install or Connect (Figure 16)

1. Large gasket over the lock rod and onto the handle.
2. Handle with the lock rod onto the door.
3. Door to outside handle screw (54) to the push button side of the handle.
  - Do not tighten.
4. Small gasket between the door and the handle.
5. Door to outside handle screw (54) to the other side of the handle.
  - Tighten both screws.

DOOR ADJUSTMENT

 ↔ Remove or Disconnect

Tool Required:
J-23457-A Wrench.
• Door striker bolt using J-23457-A.

Adjust (Figure 23)
• The door up or down, forward or rearward, and in or out, at the door hinges.

1. Adjust the door to obtain a gap of 6 mm ± 2 mm (0.24-inch ± 0.09-inch) between the rocker panel and the door.
2. The gap between the door and the roof panel should be 5 mm ± 2 mm (0.19-inch ± 0.09-inch).
3. Adjust the door to obtain a gap of 5 mm ± 2 mm (0.19-inch ± 0.09-inch) between the doors rear edge and the rear door pillar.
4. The gap between the door and the center pillar should be 5 mm ± 2 mm (0.19-inch ± 0.09-inch).
5. The door surface should be flush with the other panels within ± 1.5 mm (± 0.06-inch) except for the door to roof panel surface which should be flush within + 1.5 mm (+ 0.06-inch).

 ↔ Install or Connect

RV MODEL REAR DOORS

DOOR ADJUSTMENT

Each of the two doors must first be adjusted in the door opening before adjusting the door to door clearance.

Adjust (Figure 36)
1. The door height so that there is a gap of 5 mm ± 2.3 mm (0.190-inch ± 0.09-inch) between the roof panel and the rear door panel.
2. The gap between the bottom of the door panel (not the bottom of the outer panel) and the platform panel should be 7 mm (0.280-inch). This measurement should be taken on each door individually from the side of the door. The door should be in its normal closed position. (The outer rear door panel is 14 mm ± 1.5 mm (0.560-inch ± 0.06-inch) away from the rear platform panel when normally closed).
3. The rear door outer panel to the body side outer panel gap to 5 mm ± 2.3 mm (0.190-inch ± 0.09-inch).
4. The door to door clearance between the left and right outer door panels should be 5 mm ± 2.3 mm (0.190-inch ± 0.09-inch).

WINDOW REPLACEMENT

If a glass is cracked but still intact, it should be crisscrossed with masking tape to reduce the risk of injury and/or damage to the vehicle. If a crack extends to the edge of the glass, mark the door with a piece of chalk at the point where the crack meets the weatherstrip. Later, when examining the flange of the opening for a cause of the crack, start at the point marked.
It is important that the cause of the crack be determined and the condition corrected, before the new glass is installed. The cause of the crack may be an obstruction or high spot somewhere around the flange of the opening; cracking may not occur until pressure from the high spot or obstruction becomes particularly high due to winds, extremes of temperature, or rough terrain.

**Remove or Disconnect (Figure 40)**

**CAUTION:** Always wear heavy gloves when handling glass to minimize the risk of injury.

1. Weatherstrip seal by running a putty knife between the flange and the weatherstrip (inside and outside the door).
   - Have an assistant outside the cab by the window.
2. Weatherstrip and glass from the flange.
   - Force the weatherstrip from the flange from the inside with a putty knife.
3. Window from the weatherstrip.

**Install or Connect (Figure 40)**

1. Weatherstrip to the glass.
2. A six mm (\(1/4\)-inch) cord in the weatherstrip groove. The ends should overlap about 5 cm (6-inches) at the window bottom.
3. Window and weatherstrip on the flange from outside the cab.
   - Brush soapy water on the flange.
   - Have an assistant pull the cord from inside the cab to seat the lip of the weatherstrip on the flange.

VENT GLASS REPLACEMENT

CAUTION: Always wear heavy gloves when handling glass to minimize the risk of injury.

REMOVAL (Figure 57)
1. Open the vent window.
2. Squirt solvent on the tar-paper-like filler all around the glass channel, on both sides of the glass.
3. When the filler and sealer soften, pull the glass and the old filler from the channel.

INSTALLATION
1. Thoroughly clean the inside of the glass channel with sandpaper to remove all rust and foreign matter.
2. Cut the new piece of glass channel filler 51 mm (2-inches) longer than required.
3. Position the filler (soap stoned side away from the glass) evenly around and over the edge of the glass that will be inserted in the channel. Press the filler
**VENT WINDOW ADJUSTMENT**

Adjust (Figure 58)

- Remove the door trim panel. Refer to "Door Trim Panel Replacement."
- Bend the tabs on the adjustment nut away from the nut.
- Adjust the vent by placing a wrench on the adjusting nut, and then turning the vent window to the proper tension.
- Bend the tabs over the adjustment nut.

**DOOR WINDOW REPLACEMENT**

Remove or Disconnect (Figure 59)

CAUTION: Always wear heavy gloves when handling glass to minimize the risk of injury.

- Lower the glass to the bottom of the door.

**VENT WINDOW ADJUSTMENT**

Adjust (Figure 58)

- Remove the door trim panel. Refer to "Door Trim Panel Replacement."
- Bend the tabs on the adjustment nut away from the nut.
- Adjust the vent by placing a wrench on the adjusting nut, and then turning the vent window to the proper tension.
- Bend the tabs over the adjustment nut.

WINDOW REGULATOR REPLACEMENT

MANUAL REGULATOR

Remove or Disconnect (Figure 59)
- Raise the window and tape the glass in the full up position using cloth body tape.
  1. Door trim panel. Refer to "Door Trim Panel Replacement."
  2. Door panel to regulator bolts (237).
  3. Window regulator (238):
     - Slide the regulator rearward to disengage the rear roller from the sash channel. Also disengage the lower roller from the regulator rail.
     - Disengage the forward roller from the sash channel at the notch in the sash channel.
     - Collapse the regulator, and remove it through the access hole in the door.

Install or Connect
- Lubricate the regulator and the sash and regulator rails with lubricant or equivalent.
  1. Window regulator (238):
     - Collapse the regulator, and insert it through the access hole in the door.
     - Unfold the regulator, and engage the forward roller to the sash channel at the sash channel notch.
     - Slide the regulator rearward to engage the rear roller to the sash channel. Also engage the lower roller to the regulator rail.
     - Slide the regulator into its proper position, and insert the regulator drive through the door panel.
  2. Door panel to regulator bolts (237).
  3. Door trim panel. Refer to "Door Trim Panel Replacement."
- Remove the tape from the window.

POWER REGULATOR
For the diagnosis of power window circuits, refer to CAB ELECTRICAL (SEC. 8A).

Remove or Disconnect (Figure 60)
- Raise the window and tape the glass in the full up position using cloth body tape.
  1. Battery ground cable.
  2. Door trim panel. Refer to "Door Trim Panel Replacement."
  3. Remote control to door trim panel bolts.
     - Lay the control aside.
  4. Regulator to door panel bolts (244) and nuts (245).
  5. Wiring harness from the regulator.
  6. Window regulator (246):
     - Slide the regulator rearward to disengage the rear roller from the sash channel. Also disengage the lower roller from the regulator rail.
     - Disengage the forward roller from the sash channel at the notch in the sash channel.
     - Collapse the regulator, and remove it through the access hole in the door.

Install or Connect (Figure 60)
- Lubricate the motor drive gear and regulator sector teeth.
  1. Regulator motor to regulator.

CAUTION: The next step must be performed when the regulator is removed from the door. The regulator lift arms are under tension from the counterbalance spring and can cause serious injury if the motor is removed without locking the sector gear in position.
- Drill a hole through the regulator sector gear and back plate. Drill the hole at least 12.7 mm (1/2-inch) away from the edge of the sector gear or back plate. Install a pan head sheet metal tapping screw at least 19 mm (3/4-inch) long into the drilled hole to lock the sector gear in place.

in the secondary latched position. (The door is latched but not fully closed.) An 1¼-inch diameter drill bit may be used to gage this clearance.

- The front intermediate striker on the rear door. Adjust it so that the front door lock properly engages the rear door, and so the front door is flush with the rear door.
If a glass is cracked but still intact, it should be crisscrossed with masking tape to reduce the risk of injury and/or damage to the vehicle. If a crack extends to the edge of the glass, mark the door with a piece of chalk at the point where the crack meets the weatherstrip. Later, when examining the flange of the opening for a cause of the crack, start at the point marked.

It is important that the cause of the crack be determined and the condition corrected, before the new glass is installed. The cause of the crack may be an obstruction or high spot somewhere around the flange of the opening; cracking may not occur until pressure from the high spot or obstruction becomes particularly high due to winds, extremes of temperature, or rough terrain.

### STATIONARY GLASS

**Remove or Disconnect (Figure 73)**

*CAUTION:* Always wear heavy gloves when handling glass to minimize the risk of injury.

1. Weatherstrip seal by running a putty knife between the flange and the weatherstrip (inside and outside the door).
   - Have an assistant outside the cab by the window.
2. Weatherstrip and glass from the flange.
   - Force the weatherstrip from the flange from the inside with a putty knife.
3. Window from the weatherstrip.

**Install or Connect (Figure 73)**

1. Weatherstrip to the glass.
   - The seam of the weatherstrip must be located at the bottom centerline of the glass.
2. A six mm (⅛-inch) cord in the weatherstrip groove. The ends should overlap about 5 cm (6-inches) at the window bottom.
3. Window and weatherstrip on the flange from outside the cab.
   - Brush soapy water on the flange.
   - Have an assistant pull the cord from inside the cab to seat the lip of the weatherstrip on the flange.
**SWING OUT WINDOW**

Remove or Disconnect (Figures 74 and 75)

**CAUTION:** Always wear heavy gloves when handling glass to minimize the risk of injury.

1. Window latch to door screws (327).
2. Window latch from the window.
   - Twist the latch 1/4 of a turn to release the latch components from the window.
   - Lift the window for access to the hinge screws.
3. Hinge to door screws (320).
4. Hinge from the door.
5. Hinge seal from the door.

Install or Connect (Figures 74 and 75)

1. Hinge and hinge seal to the door.
2. Hinge to door screws (320).
3. Window latch to the window.
   - Place the cover and spacer through the window.
   - Place the washer and spring onto the cover.
   - Twist the latch onto the cover with 1/4 of a turn.

LOWER ROLLER ASSEMBLY REPLACEMENT

Remove or Disconnect (Figure 89)
- Mark the position of the assembly to the bracket on the roller assembly.
  1. Roller assembly to door bracket bolts (401).
  2. Catch clip (400) and rod from the catch.
  3. Pivot the roller assembly out of the lower door track.

Install or Connect (Figure 89)
1. Pivot the roller assembly into the lower door track.
2. Roller assembly to door bracket bolts (401).
   - Align the roller assembly to the previously made mark.
3. Catch clip (400) and rod to the catch.

UPPER FRONT ROLLER REPLACEMENT

DOOR ADJUSTMENT

UP AND DOWN ADJUSTMENT

Remove or Disconnect (Figure 90)
Tool Required: J-23457 #50 Torx Wrench.
1. Upper rear hinge cover.
2. Front lock striker (404).
3. Rear lock striker (405) using J-23457.
4. Rear door wedge assembly (407).

Adjust (Figure 91)
1. The rear edge of the door to obtain a gap of 4.5 mm ± 0.5 mm (0.18-inch ± 0.02-inch) between the top of the door and the roof side rail. This adjustment should provide a gap of 6 mm ± 0.5 mm (0.25-inch ± 0.02-inch) between the bottom of the door and the rocker panel. To accomplish this adjustment, loosen the upper rear hinge to door bolts (figure 88), and align the rear edge of the door up or down. Next, tighten the upper rear hinge to door bolts (figure 88).
2. The front edge of the door by loosening the upper front roller bracket to door bolts (figure 87) and the lower hinge to door bolts (figure 89). Align the door to obtain the same gap as in step 1, then tighten the lower hinge to door bolts (figure 89).

3. The upper front roller bracket up or down so that the roller is centered in the track. The roller must not touch the top or bottom of the track. Tighten the upper front roller bracket to door bolts (figure 92).

**Install or Connect (Figure 90)**

1. Rear door wedge assembly (407).
2. Rear lock striker (405) using J-23457.
3. Front lock striker (404).
4. Upper rear hinge cover.

**IN AND OUT ADJUSTMENT (Figures 90 through 92)**

1. Remove the front lock striker (404).
2. Loosen the nut (418) retaining the upper front roller (415) to the upper roller bracket (381).
3. Loosen the lower front roller assembly to roller assembly bracket bolts (figure 89).
4. Loosen the rear door lock striker.
5. Adjust the door in or out until the surface of the door is flush with the surface of the body.
6. Tighten the rear door lock striker.
7. Tighten the lower front roller assembly to roller assembly bracket bolts (figure 89).
8. Tighten the nut (418) retaining the upper front roller (415) to the upper roller bracket (381).
9. Install the front lock striker.

**FORWARD AND REARWARD ADJUSTMENT**

1. Mark the position of the front and rear latch strikers on the body pillars.
2. Remove the front (404) and rear (405) lock strikers (figure 90).
3. Remove the upper front track cover.
4. Loosen the upper rear hinge striker (figure 88).
5. Adjust the door forward or rearward to obtain a gap of 4.5 mm ± 0.5 mm (0.18-inch ± 0.02-inch) between the left and right door edge and the door pillars (figure 91).
6. Tighten the upper rear hinge striker (figure 88).
7. Install the upper front track cover.
8. Install the front (404) and rear (405) lock strikers at the position previously marked (figure 90).

**FRONT STRIKER ADJUSTMENT (Figure 90)**

1. Loosen the front latch striker bolts (403).
2. Slide the door towards the striker.
3. The guide on the door must fit snugly into the rubber lined opening in the striker assembly.
4. Check that the latch fully engages the striker. Add or delete shims behind the striker to accomplish this adjustment.
5. Tighten the striker bolts (403).

**REAR STRIKER ADJUSTMENT (Figure 90)**

**Tool Required:** J-23457 Wrench.

1. Loosen the striker using J-23457.
2. Loosen the rear wedge assembly.
3. Center the striker vertically so that the striker properly engages the door lock. Mark the vertical position of the striker.
4. Adjust the striker in or out to align the surface of the door flush with the body surface. Mark the position of the striker.
5. Tighten the striker using J-23457.
6. Open the door, and apply grease to the striker.
7. Close the door to make an impression of the lock on the striker.
8. Open the door and measure the distance from the rear of the striker head to the impression. The distance should be between 5 mm and 8 mm (0.20-inch and 0.30-inch).
9. Adjust the striker by adding or deleting shims. Align the striker to the previously made marks.
10. Tighten the striker using J-23457.

**UPPER REAR HINGE ADJUSTMENT (Figure 93)**

1. The lower hinge lever (419) should have a gap of 2.5 mm to 4 mm (0.10-inch to 0.16-inch) between the outer edge of the lower lever and the striker latch edge. This adjustment is made by adding an equal amount of

shims between the guide block (420) and the hinge assembly, and between the roller and the hinge assembly.

2. Adjust the striker up or down to obtain a gap of 1.5 mm (0.06-inch) between the lower edge of the striker plate (395) and the lower edge of the lower hinge lever (419).

3. Adjust the guide up or down to obtain a gap of 0.5 mm (0.02-inch) between the track and the guide.

DOOR HOLD OPEN CATCH ADJUSTMENT (Figure 89)

1. Mark the position of the lower roller assembly to the bracket.

2. Loosen the lower roller assembly bolts (401).

3. Pivot the lower roller assembly to properly engage the latch striker.

4. Tighten the lower roller assembly bolts (401).

REAR WEDGE ASSEMBLY ADJUSTMENT (Figure 94)

1. Loosen the rear wedge assembly screws (408).

2. Completely close the door.

3. From inside the vehicle, center the wedge assembly (407) onto the door wedge.

4. Mark the position of the wedge assembly.

5. Open the door, and move the wedge assembly forward 4.7 mm (3/16-inch).

6. Tighten the rear wedge assembly screws (408).
DOOR TRIM PANEL REPLACEMENT

Remove or Disconnect (Figure 95)
1. Inside door handle screw (429).
2. Inside door handle (422).
3. Inside door handle cover (430).

STATIONARY GLASS

Remove or Disconnect (Figure 96)

CAUTION: Always wear heavy gloves when handling glass to minimize the risk of injury.
1. Weatherstrip seal by running a putty knife between the flange and the weatherstrip (inside and outside the door).
   • Have an assistant outside the cab by the window.
2. Weatherstrip and glass from the flange.
   • Force the weatherstrip from the flange from the inside with a putty knife.
3. Window from the weatherstrip.

Install or Connect
1. Weatherstrip to the glass.
   • The seam of the weatherstrip must be located at the bottom of the glass.
2. A six mm (1/4-inch) cord in the weatherstrip groove. The ends should overlap about 5 cm (6-inches) at the window bottom.
3. Window and weatherstrip on the flange from outside the cab.
   • Brush soapy water on the flange.
   • Have an assistant pull the cord from inside the cab to seat the lip of the weatherstrip on the flange.

SWING OUT WINDOW

Remove or Disconnect (Figure 97)

CAUTION: Always wear heavy gloves when handling glass to minimize the risk of injury.
1. Window latch to door screws (441).
2. Window latch from the window.
   • Twist the latch 1/4 of a turn to release the latch components from the window.
   • Lift the window for access to the hinge screws.
3. Hinge to door screws (435).

Window Replacement

If a glass is cracked but still intact, it should be crisscrossed with masking tape to reduce the risk of injury and/or damage to the vehicle. If a crack extends to the edge of the glass, mark the door with a piece of chalk at the point where the crack meets the weatherstrip. Later, when examining the flange of the opening for a cause of the crack, start at the point marked.

It is important that the cause of the crack be determined and the condition corrected, before the new glass is installed. The cause of the crack may be an obstruction or high spot somewhere around the flange of the opening; cracking may not occur until pressure from the high spot or obstruction becomes particularly high due to winds, extremes of temperature, or rough terrain.
4. Hinge from the door.
5. Hinge seal from the door.

Install or Connect (Figure 97)
1. Hinge and hinge seal to the door.
2. Hinge to the door screws (435).
3. Window latch to the window.
   - Place the cover and spacer through the window.
   - Place the washer and spring onto the cover.
   - Twist the latch onto the cover with ¼ of a turn.
4. Window latch to door screws (441).

FRONT LOCK REPLACEMENT

Remove or Disconnect (Figures 98 and 99)
1. Door trim panel. Refer to "Door Trim Panel Replacement."
2. Lock access panel screws (445) and the panel (444).
   • Pull the panel upwards to disengage the clips.
3. Outside door handle (422).
4. Lock to door screws (449 and 451).
5. Rear door lock rods from the front lock.
   • Pivot the clips from the rods, and pull the rods from the lock.
6. Lower latch rod from the lock.
   • Pivot the clip from the rod and pull the rod from the lock.

8. Lock assembly from the door.

Install or Connect (Figures 98 and 99)
1. Lock assembly to the door.
2. Lock cylinder rod clip.
3. Lower latch rod to the lock.
   • Pivot the clip onto the rod.
4. Rear door lock rods to the front lock.
   • Pivot the clip onto the rod.
5. Lock to door screws (449 and 451).
6. Outside door handle (422).
7. Lock access panel (444) and panel screws (445).

   - Align the hinge to the previously made mark.
7. Strap pin (469).
8. Electrical wiring harness.
   - Refer to "Door Trim Panel Replacement" for access to the wiring harness.
**DOOR ADJUSTMENT**

Each of the two doors must first be adjusted in the door opening before adjusting the door to door clearance.

**Adjust (Figure 104)**

1. The door height so that there is a gap of 6 mm ± 0.5 mm (0.25-inch ± 0.02-inch) between the roof panel and the rear door panel.
2. The gap between the bottom of the door panel (not the bottom of the outer panel) and the platform panel should be 6 mm ± 0.5 mm (0.25-inch ± 0.02-inch). This measurement should be taken on each door individually from the side of the door. The door should be in its normal closed position. (The outer rear door panel is 15.25 mm ± 0.5 mm (0.60-inch ± 0.02-inch) away from the rear platform panel when normally closed).
3. The rear door outer panel to the body side outer panel gap to 4 mm ± 0.5 mm (0.16-inch ± 0.02-inch).
4. The door to door clearance between the left and right outer door panels should be 6 mm ± 0.5 mm (0.25-inch ± 0.02-inch).

**STRIKER REPLACEMENT**

**Remove or Disconnect (Figure 105)**

1. Striker to door frame bolts (486).
2. Striker from the door frame.
3. Spacer (if equipped).

**Install or Connect (Figure 105)**

1. Spacer (as required).
2. Striker to the door frame.
3. Striker to door frame bolts (486).

**Adjust (Figure 106)**

- The striker to door latch clearance so that there are 4.4 mm (0.172-inch) between the striker and the door latch when the door is in the secondary latched position. (The door is latched but not fully closed.) An $\frac{11}{16}$-inch diameter drill bit may be used to gage this clearance.

**DOOR TRIM PANEL REPLACEMENT**

**Remove or Disconnect (Figure 107)**

**WINDOW REPLACEMENT**

If a glass is cracked but still intact, it should be crisscrossed with masking tape to reduce the risk of injury and/or damage to the vehicle. If a crack extends to the edge of the glass, mark the door with a piece of chalk at the point where the crack meets the weatherstrip. The cause of the crack may be an obstruction or high spot somewhere around the flange of the opening; cracking may not occur until pressure from the high spot or obstruction becomes particularly high due to winds, extremes of temperature, or rough terrain.

**CAUTION:** Always wear heavy gloves when handling glass to minimize the risk of injury.

1. Using a 3/16-inch drill bit, drill the rivets from the weatherstrip (if equipped).
2. Weatherstrip seal by running a putty knife between the flange and the weatherstrip (inside and outside the door).
   - Have an assistant outside the cab by the window.
3. Weatherstrip and glass from the flange.
   - Force the weatherstrip from the flange from the inside with a putty knife.
4. Window from the weatherstrip.

**Install or Connect (Figure 109)**

1. Weatherstrip to the glass.
2. A six mm (1/4-inch) cord in the weatherstrip groove. The ends should overlap about 5 cm (6-inches) at the window bottom.
3. Window and weatherstrip on the flange from outside the cab.
   - Brush soapy water on the flange.
   - Have an assistant pull the cord from inside the cab to seat the lip of the weatherstrip on the flange.
4. Rivets (if equipped) to the weatherstrip with a rivet gun.
   - Use 3/16-inch blind rivets.

**LEFT DOOR WEATHERSTRIP REPLACEMENT**

**Remove or Disconnect (Figure 117)**

Tool Required:
- J-24595-B Door Trim Pad Clip Remover.

1. Weatherstrip to door fasteners using J-24595-B.
2. Weatherstrip from the door using 3M Release Agent (or equivalent).
3. Plastic nails from the door frame.

**Clean**
- The door and weatherstrip of all the old cement.

**Install or Connect (Figure 117)**
1. New weatherstrip to the door using 3M Weatherstrip Adhesive (or equivalent).
   - Push the plastic nails into the door frame.
2. Weatherstrip to door fasteners.
**Power Door Lock Motor Replacement**

**Remove or Disconnect (Figure 119)**
1. Battery ground cable.
2. Door trim panel. Refer to "Door Trim Panel Replacement."
3. Electrical connector from the motor.
4. Door to motor screws (540).
5. Motor from the lock rod.
   - Slide the rubber mount at the top of the motor off of the door lock rod.
6. Motor from the door.

**Install or Connect (Figure 119)**
1. Motor into the door.
2. Motor to the lock rod.
   - Slide the rubber mount at the top of the motor onto the door lock rod.
3. Door to motor screws (540).

SECTION 10A2

SEATS

The following "Notice" applies to one or more steps in the assembly procedure of components in this portion of the manual as indicated at appropriate locations by the terminology "NOTICE: See 'Notice' on page 10A2-1 of this section."

NOTICE: All seat belt fasteners are important attaching parts in that they could affect the performance of all vital parts and systems, and/or could result in major repair expense. They must be replaced with one of the same part number or with an equivalent part if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to assure proper retention of all parts.

## DIAGNOSIS OF MANUAL SEAT ADJUSTER

<table>
<thead>
<tr>
<th>PROBLEM</th>
<th>POSSIBLE CAUSE</th>
<th>CORRECTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjuster Will Not Lock</td>
<td>1. Locking wire too tight.</td>
<td>1. Loosen the locking wire tension enough to provide full engagement of the lock bar in the locking slots of the adjuster lower channel. Refer to “Seat Adjuster Adjustment.”</td>
</tr>
<tr>
<td></td>
<td>2. Adjuster lock bar spring disconnected or broken.</td>
<td>2. Connect the spring or install a new spring.</td>
</tr>
<tr>
<td></td>
<td>3. Adjuster lock bar sticking or binding.</td>
<td>3. Lubricate the lock bar pivot. If the bar is binding, eliminate the cause of binding or replace the adjuster.</td>
</tr>
<tr>
<td>Adjuster Will Not Unlock</td>
<td>1. Locking wire too loose or disconnected.</td>
<td>1. Tighten the locking wire enough to allow the lock bar to disengage from the locking slots in the adjuster lower channel when the lock control lever is activated. Refer to “Seat Adjuster Adjustment.”</td>
</tr>
<tr>
<td></td>
<td>2. Adjuster lock bar sticking or binding.</td>
<td>2. Lubricate the lock bar pivot. If the bar is binding, eliminate the cause of binding or replace the adjuster.</td>
</tr>
<tr>
<td>When The Left Adjuster Locks, The Right Adjuster Is Between Lock Positions</td>
<td>1. Right adjuster either rearward or forward of the left adjuster.</td>
<td>1. Loosen the adjuster to floor pan bolts or nuts — move one adjuster forward or rearward as far as possible and the other adjuster in the opposite direction. Refer to “Seat Adjuster Adjustments.”</td>
</tr>
<tr>
<td>Seat Hard To Move Forward Or Rearward</td>
<td>1. Adjusters new, not broken in.</td>
<td>1. Operate the seat to the full forward and full rearward positions several times to work the new tightness out of the channels.</td>
</tr>
<tr>
<td></td>
<td>2. Adjuster(s) improperly lubricated.</td>
<td>2. Lubricate the adjuster channels with Lubriplate or equivalent.</td>
</tr>
<tr>
<td></td>
<td>3. Adjuster(s) binding due to bent or damaged channels.</td>
<td>3. Replace the adjuster.</td>
</tr>
<tr>
<td></td>
<td>4. Adjusters not in parallel alignment with each other.</td>
<td>4. Loosen the floor pan attaching bolts or nuts, align the adjusters parallel on the floor pan and tighten nuts. Refer to “Seat Adjuster Adjustments.”</td>
</tr>

SEAT ADJUSTER ADJUSTMENT

Adjust

- Remove the seat. Refer to “Front Seat and Seat Adjuster Replacement.”
  - Leave the adjuster on the seat.
- Loosen the adjuster to seat bolts.
  1. The adjuster rails forward or rearward so that both rails are the same distance from the front of the seat.
  2. The adjuster rails so they are parallel to each other.
- Tighten the adjuster to seat bolts.
  3. Wire assembly tension. Three holes on the secondary adjuster rail allow for tension adjustment of the wire assembly (figure 1).
    - Slide the spring off of the hook.
    - Open the hook, and remove it from the hole.
    - Move the hook to a forward hole to loosen the wire, move the hook to a rearward hole to tighten it.
  4. Close the hook, and slide the spring over the hook.
- Install the seat. Refer to “Front Seat and Seat Adjuster Replacement.”

RV MODEL FRONT SEATS

FRONT SEAT AND SEAT ADJUSTER REPLACEMENT

This procedure applies to all RV Model front seats, whether bench or bucket type with the exception of the utility vehicle passenger front bucket seat. Refer to “Utility Vehicle Passenger Front Bucket Seat Replacement” for information on this type of seat.

Remove or Disconnect (Figures 2 and 3)

1. Bolt cover (5) (if equipped).
2. Seat adjuster to floor panel bolts (7).
3. Seat (10) with adjuster (2) from the vehicle.
4. Adjuster to seat bolts (8).
5. Adjuster (2) from the seat (10).

Install or Connect (Figures 2 and 3)

2. Adjuster to seat bolts (8).
3. Seat (10) with adjuster (2) to the vehicle.
4. Seat adjuster to floor panel bolts (7).
5. Bolt cover (5) (if equipped).

UTILITY VEHICLE PASSENGER FRONT BUCKET SEAT REPLACEMENT

Remove or Disconnect (Figure 4)

- Place the seat in its forward position.
  1. Restraint cable (19) to the floor panel bolt (22).
  - Allow the seat to tip forward.
  2. Spring retaining bracket bolts (12) and the bracket (13).
  3. Lower seat bracket (23) to the floor panel bolts (20).
  4. Seat from the vehicle.
  5. Upper seat bracket bolts (15).
  6. Seat brackets (14) from the seat.

Install or Connect (Figure 4)

1. Upper bracket (14) to the lower bracket (23).
2. Springs (21) onto the sleeve (24).
3. Brackets (14 and 16) to the sleeve.
4. Pivot stud (25).
5. Washer (17).
  - Tighten each nut until it bottoms out.

7. Retractor from the vehicle.
8. Plug (37).
9. Buckle (34) to floor bolt (38).
10. Buckle from the floor.

NOTICE: For steps 2, 6, and 9 see "Notice" on page 10A2-1 of this section.

Install or Connect
1. Buckle (38) to the floor.
2. Buckle to floor bolt (38).

Tighten
• Bolt to 50 N·m (37 ft. lbs.).
3. Plug (37).
4. Retractor to the vehicle.
5. Seat belt wire (left side only).
6. Retractor to floor bolt (40).

Tighten
• Bolt to 50 N·m (37 ft. lbs.).
7. Plug (39) (except regular cab).

2. Spacer (78) as required.
3. Striker (77).
4. Striker bolts (76).
5. Bumpers (75).
6. Bumper (75) to seat bolts (74).

**CENTER SEAT BOTTOM STRIKER REPLACEMENT**

**Remove or Disconnect (Figure 11)**
- Fold the seat bottom forward.
  1. Striker (65) to seat bolts (66).
  2. Striker (65) from the seat.

**Install or Connect (Figure 11)**
1. Striker (65) to the seat.
2. Striker (65) to seat bolts (66).

**CENTER SEATBACK LATCH REPLACEMENT**

**Remove or Disconnect (Figure 13)**
- Fold the seatback forward.
  1. Latch bolts (83).
  2. Latch from the vehicle.

**Install or Connect (Figure 13)**
1. Latch to the vehicle.

2. Retractor bolts (93).
3. Retractor (92) from the vehicle.
4. Guide assembly bolts (97) and the guides (96).
5. Buckle (95) and latch plate (99) assembly bolts (98).
6. Buckle and latch plate assemblies from the vehicle.

**Install or Connect (Figure 15)**

**NOTICE:** For steps 2 and 5 see "Notice" on page 10A2-1 of this section.

1. Buckle and latch plate assemblies to the vehicle.
2. Buckle and latch plate assembly bolts (98).

**Tighten**
- Bolts to 50 N·m (37 ft. lbs.).
3. Guide assemblies (96) and guide bolts (97).
4. Retractor (92) to the vehicle.
5. Retractor bolts (93).
6. Retractor flaps (94).

RV MODEL TOP STRAP BELT ANCHOR INSTALLATION

Figure 27—Pickup Top Strap Belt Components

All hardware discussed in this procedure should be supplied or available from the child seat manufacturer. Be sure the child seat position does not conflict with any additional requirements provided by its manufacturer, or with any recommendations in the Child Restraint section of the Owner’s Manual.

The child seat may be used only in a forward facing seating location.

PICKUP AND CREW CAB MODELS

1. Place the Child Seat in the front seating position (rear seating position on crew cab models) (figure 27).
2. Secure the vehicle lap belt over the armrests of the Child Seat in the position which the Child Seat will be used.
3. Select a suitable anchor bracket mounting location on the cab back panel. The location must be:
   - Located near the rear window reinforcement. The angle between the Child Seat top strap and horizontal should not exceed 45°.
   - As close to the center line of the Child Seat as possible, but in no case more than 50 mm (2-inches) towards the passenger side of the cab, and 150 mm (6-inches) towards the drivers side of the cab.
   - In a position clear of the fuel tank, fuel lines, brake lines, exhaust systems, etc.
4. Drill an 8 mm (5/32-inch) diameter hole through the cab panel at the selected location.

NOTICE: See “Notice” on page 10A2-1 of this section.

5. Install the bolt (161), anchor bracket (160), anchor plate (158), and lock nut (159) to the hole with an appropriate sealant.
6. Tighten the nut to 31 N·m (23 ft. lbs.). Use the Child Seat only in the seating position for which the anchor bracket has been installed, latching the Child Seat top strap hook to the anchor bracket as shown.

CAUTION: In the event that the Child Seat anchorage assembly is removed, the 8 mm (5/32-inch) diameter hole must be properly resealed to prevent toxic exhaust fumes from entering the cab.

UTILITY VEHICLE REAR SEAT

1. Determine the location for the anchor by measuring 140 mm (5 1/2-inches) forward from the rear edge of the floor pan (figure 28). Make this measurement in the center of one of the depressed floor pan ribs. Next, measure 1330 mm (52.25-inches) inboard of the right quarter inner panel. Mark the position where these measurements meet.
2. Drill an 8 mm (5/32-inch) hole at the mark.
3. To insure proper sealing of the hole, remove any dirt or foreign matter from around the hole on the underside of the floor pan where the sealer is to be applied.

NOTICE: See “Notice” on page 10A2-1 of this section.

4. Place sealer on the hole from the underside of the vehicle and assembly the bolt (162), anchor plate (163), washer (165), and lock nut (166) to the floor pan.
5. Tighten the nut to 31 N·m (23 ft. lbs.). Use the Child Seat only in the seating position for which the anchor bracket has been installed.

NOTICE: In the event the Child Seat anchorage assembly is removed, the 8 mm (5/32-inch) diameter hole must be properly resealed.

SUBURBAN FRONT SEAT

This procedure applies to vehicles not equipped with a second seat or vehicles with the second seat in the down position.

1. Determine the location for the anchor by measuring 51 mm (2-inches) rearward from the rear edge of the kick up molding. Make this measurement in the center of one of the depressed floor pan ribs (figure 29).
   A. Measure 360 mm (14.6-inches) inboard of the right quarter inner panel for the right seating position.

B. Measure 895 mm (35.25-inches) inboard of the right quarter inner panel for the center seating position.  
Mark the position where the measurements meet.  
2. Drill an 8 mm (5/16-inch) hole at the mark.  
3. To insure proper sealing of the hole, remove any dirt or foreign matter from around the hole on the underside of the floor pan where the sealer is to be applied.  
**NOTICE:** See "Notice" on page 10A2-1 of this section.  
4. Place sealer on the hole from the underside of the vehicle and assemble the bolt (172), anchor plate (173), washer (175), and lock nut (176) to the floor pan.  
5. Tighten the nut to 31 N·m (23 ft. lbs.). Use the Child Seat only in the seating position for which the anchor bracket has been installed.  
**NOTICE:** In the event the child seat anchorage assembly is removed, the 8 mm (5/16-inch) diameter hole must be properly resealed.

**SUBURBAN SECOND SEAT**

1. Determine the location for the anchor by measuring 650 mm (25 1/2-inches) rearward from the rear edge of the kick-up molding (figure 30). Next:  
   A. Measure 55 mm (2.12-inches) inboard of the right wheelhouse for the right seating position.

**SUBURBAN THIRD SEAT**

1. Determine the location for the anchor by measuring 127 mm (5-inches) forward from the rear edge of the floor pan. Make this measurement in the center of one of the depressed floor pan ribs (figure 31).

B. Measure 590 mm (23.25-inches) inboard of the right wheelhouse for the center seating position.  
C. Measure 55 mm (2.12-inches) inboard of the left wheelhouse for the left seating position.  
Mark the position where the measurements for the desired seating position meet.  
2. Drill an 8 mm (5/16-inch) hole at mark.  
3. To insure proper sealing of the hole, remove any dirt or foreign matter from around the hole on the underside of the floor pan where the sealer is to be applied.  
**NOTICE:** See "Notice" on page 10A2-1 of this section.  
4. Place sealer on the hole from the underside of the vehicle and assemble the bolt (172), anchor plate (173), washer (175), and lock nut (176) to the floor pan.  
5. Tighten the nut to 31 N·m (23 ft. lbs.). Use the Child Seat only in the second seat seating position for which the anchor bracket has been installed.  
**NOTICE:** In the event the child seat anchorage assembly is removed, the 8 mm (5/16-inch) diameter hole must be properly resealed.
Next:
A. Measure 535 mm (21-inches) inboard of the right quarter inner panel for the right seating position.
B. Measure 805 mm (31.75-inches) inboard of the right quarter inner panel for the center seating position.
C. Measure 1,160 (45.75-inches) inboard of the right quarter inner panel for the left seating position.

2. Drill an 8 mm (5/32-inch) hole at the mark.
3. To insure proper sealing of the hole, remove any dirt or foreign matter from around the hole on the underside of the floor pan where the sealer is to be applied.

**NOTICE:** See "Notice" on page 10A2-1 of this section.

4. Place sealer on the hole from the underside of the vehicle and assemble the bolt (177), anchor plate (178), washer (180), and lock nut (181) to the floor pan.

5. Tighten the nut to 31 N-m (23 ft. lbs.). Use the Child Seat only in the third seat seating position for which the anchor bracket has been installed.

**NOTICE:** In the event the Child Seat anchorage assembly is removed, the 8 mm (5/32-inch) diameter hole must be properly resealed.

**NOTICE:** If the hole penetrates to the exterior of the vehicle, apply a sealant between the anchor bolt washer and the sheet metal to prevent carbon monoxide from entering the vehicle. Suitable sealers include silicone, butyl or acrylic type caulking.

In the event that the child seat anchorage assembly is removed, all bolt holes penetrating to the exterior of the vehicle must be resealed to prevent exhaust fumes from entering the vehicle.

G MODEL TOP STRAP BELT ANCHOR INSTALLATION

All hardware discussed in this procedure should be supplied or available from the child seat manufacturer. Be sure the child seat position does not conflict with any additional requirements provided by its manufacturer, or with any recommendations in the Child Restraint section of the Owner’s manual.

The child seat may be used only in a forward facing seating location.

Installation of top strap belts is not recommended in the front passenger seat of "G" Vans. The second seat offset which allows passenger entry does not position a second seat lap belt within the recommended zone for attachment to the top strap hook. Also, a floor anchorage is impractical since the top strap length is insufficient to directly connect the restraint to the floor with high back bucket seats.

VEHICLES WITH A 125-INCH WHEELBASE

SECOND SEAT LEFT SEATING POSITION
This procedure is for vehicles not having a third seat.

1. Determine the location for the anchor by measuring 76 mm (3-inches) rearward from the front edge of the left wheelhouse. Measure 60 mm (2½-inches) inboard from the left wheelhouse. Mark the position on top of the rib where these measurements meet (figure 43).

2. Drill an 8 mm (5/32-inch) hole at the mark.

3. To insure proper sealing of the hole, remove any dirt or foreign matter from around the hole on the underside of the floor pan where sealer is to be applied.

NOTICE: See "Notice" on page 10A2-1 of this section.

4. Place sealer on the hole from the underside of the vehicle and assemble the bolt (227), anchor bracket (228), two 35 mm (1½-inch) outside diameter spacer washers (230), anchor plate (231) and lock nut (232) to the floor pan.
5. Tighten the nut to 31 N·m (23 ft. lbs.). Use the Child Seat only in the seating position for which the anchor bracket has been installed.

NOTICE: In the event the Child Seat anchorage assembly is removed, the 8 mm (5/16-inch) diameter hole must be properly resealed.

SECOND SEAT—CENTER OR RIGHT SEATING POSITIONS
This procedure is for vehicles not having a third seat.

1. Determine the location for the anchor by measuring 35 mm (1 3/8-inch) rearward from the front edge of the left wheelhouse (figure 44). Next:
   A. Measure 580 mm (22 7/8-inches) inboard from the right wheelhouse for the center seating position.
   B. Measure 395 mm (15 1/2-inches) inboard of the right wheelhouse for the right seating position.

   Mark the position where the measurements for the desired seating positions meet.
2. Drill an 8 mm (5/16-inch) hole at the mark.
3. To insure proper sealing of the hole, remove any dirt or foreign matter from around the hole on the underside of the floor pan where sealer is to be applied.

NOTICE: See “Notice” on page 10A2-1 of this section.

4. Place sealer on the hole from the underside of the vehicle and assemble the bolt (234), anchor bracket (237), two 35 mm (1 3/8-inch) outside diameter spacer washers (240), anchor plate (237) and lock nut (238) to the floor pan.
5. Tighten the nut to 31 N·m (23 ft. lbs.). Use the Child Seat only in the seating position for which the anchor bracket has been installed.

NOTICE: In the event the Child Seat anchorage assembly is removed, the 8 mm (5/16-inch) diameter hole must be properly resealed.

THIRD SEAT
It is recommended that only the left seating position be used for the third seat.

1. Determine the location for the anchor by measuring 76 mm (3-inches) rearward from the left wheelhouse. Measure 10 mm (3/8-inch) inboard from the left wheelhouse. Mark the position where those measurements meet (figure 45).
2. Drill an 8 mm (5/16-inch) hole at the mark.
3. To insure proper sealing of the hole, remove any dirt or foreign matter from around the hole on the underside of the floor pan where sealer is to be applied.

NOTICE: See “Notice” on page 10A2-1 of this section.

4. Place sealer on the hole from the underside of the vehicle and assemble the bolt (241), anchor bracket (242), anchor plate (244) and lock nut (245) to the floor pan.
5. Tighten the nut to 31 N·m (23 ft. lbs.). Use the Child Seat only in the seating position for which the anchor bracket has been installed.

NOTICE: In the event the Child Seat anchorage assembly is removed, the 8 mm (5/16-inch) diameter hole must be properly resealed.

VEHICLES WITH A 110-INCH WHEELBASE

SECOND SEAT
This procedure is for vehicles without a third seat (figures 46 and 47).

1. Determine the location of the anchor by:
   A. Measuring 457 mm (18-inches) rearward from the front edge of the left wheelhouse. Measure 50 mm (2-inches) inboard of the left wheelhouse for the left seating position.
   B. Measuring 546 mm (21 1/2-inches) rearward from the front edge of the left wheelhouse. Make this measurement in the center of one of the
Figure 45—Third Seat Top Strap Components—Left Position

Depressed floor pan ribs. Next, measure 580 mm (227/8-inches) inboard of the left wheelhouse for the center seating position.

C. Measure 546 mm (21\(\frac{1}{2}\)-inches) rearward from the front edge of the right wheelhouse. Next, measure 395 mm (15\(\frac{1}{2}\)-inches) inboard from the right wheelhouse for the right seating position.

Mark the position where the measurements for the desired seatings positions meet.

2. Drill an 8 mm (\(\frac{5}{16}\)-inch) hole at the mark.

3. To insure proper sealing of the hole, remove any dirt or foreign matter from around the hole on the underside of the floor pan where sealer is to be applied.

**NOTICE:** See "Notice" on page 10A2-1 of this section.

4. Place sealer on the hole from the underside of the vehicle and assemble the bolt (248), anchor bracket (249), anchor plate (251) and lock nut (252) to the floor pan.

5. Tighten the nut to 31 N·m (23 ft. lbs.). Use the Child Seat only in the second seat seating position for which the anchor bracket has been installed.

**NOTICE:** In the event the Child Seat anchorage assembly is removed, the 8 mm (\(\frac{5}{16}\)-inch) diameter hole must be properly resealed.

SECOND SEAT — VEHICLES EQUIPPED WITH A THIRD SEAT

Use the Child Seat as directed in the usage instructions furnished with the Child Seat, in any second seating position. Latch the Child Seat top strap hook to the third seat lap belt tongue located most directly behind the Child Seat.

THIRD SEAT

The Child Seat is not recommended for use in the third seat of a 110-inch wheelbase model.

GLASS

NOTICE: If a glass is cracked but still intact, it should be crisscrossed with masking tape to reduce the risk of damage to the vehicle. If a crack extends to the edge of the glass, mark the cab with a piece of chalk at the point where the crack meets the cab.

RV MODELS

WINDSHIELD REPLACEMENT

When replacing a cracked windshield, it is important that the cause of the crack be determined and the condition corrected, before a new glass is installed. The cause of the crack may be an obstruction or high spot somewhere around the flange of the opening; cracking may not occur until pressure from the high spot or obstruction becomes particularly high due to winds, extremes of temperature, or rough terrain. Suggestions of what to look for are described later in this section under “Inspection”.

If a crack extends to the edge of the glass, mark the point where the crack meets the weatherstrip. (Use a piece of chalk and mark the point on the cab, next to the weatherstrip.) Later, when examining the flange of the opening for a cause of the crack start at the point marked.

The higher the temperature of the work area, the more pliable the weatherstrip will be. The more pliable the weatherstrip, the more easily the windshield can be removed.

++ Remove or Disconnect (Figures 1 and 2)

CAUTION: Always wear heavy gloves when handling glass to avoid the risk of injury.

Tool Required:
  J-24402-A, Glass Sealant Removal Knife
  • Place protective coverings around the glass removal area.
  1. Reveal molding cap.
  2. Reveal molding.

NOTICE: See “Notice” on page 10A3-1 of this section.

3. Windshield glass.
   • With the aid of a helper from outside the vehicle, remove windshield from opening.

4. Excess urethane and remaining weatherstrip from the pinchweld flange.
INSPECTION
An inspection of the flange of the windshield opening, the weatherstrip, and the glass may reveal the cause of a broken windshield. This can help prevent future breakage. If there is no apparent cause of breakage, the weatherstrip should be removed from the flange of the opening and the flange inspected. Look for high weld or solder spots, hardened spot weld sealer, or any other obstruction or irregularity in the flange. Check the weatherstrip for irregularities or obstructions in it.

Check a windshield that is to be installed to make sure it does not have any chipped edges. Chipped edges can be ground off, restoring a smooth edge to the glass, and minimizing concentrations of pressure that cause breakage. Remove no more than necessary, in an effort to maintain the original shape of the glass and the proper clearance between it and the flange of the opening. See “Glass-To-Opening Clearance Check” later in this section.

GLASS-TO-OPENING CLEARANCE CHECK
Before installing a windshield, the clearance between the edge of the glass and the flange of the opening should be checked. On RV Models the glass and flange overlap by 5 mm (0.2-inch). If the windshield is too big, rework the metal flange or grind off the edge of the glass. If the glass is to be ground off, place a strip of tape on the glass and use the edge of the tape as a guide.

If there is too much clearance between the glass and the flange of the opening, the flange can be built up. Braze a piece of 3 mm (1/16-inch) diameter wire to the edge of the flange. Usually, building up one side and half way around one corner will be enough. Taper off the ends of the wire to avoid an abrupt change in contour which could result, later, in a broken windshield.

SERVICE KIT
To replace a urethane adhered windshield, GM adhesive service kit No. 9636067 contains some of the materials needed, and must be used to insure the original integrity of the windshield design. Materials in the kit include:
1. One tube of adhesive material.
2. One dispensing nozzle.
3. Steel music wire.
4. Rubber cleaner.
5. Rubber primer.
6. Pinchweld primer.
7. Blackout primer.
8. Filler strip (for use on windshield installations for vehicles equipped with embedded windshield antenna).
Other materials are required for windshield installation which are not included in the service kit. These include:
1. GM Rubber lubricant No. 1051717.
2. Alcohol for cleaning the edge of the glass.
3. Adhesive dispensing gun J-24811 or
4. A standard household cartridge type gun reworked as follows:
   a. Widen the end slot to fit the diameter of the dispensing nozzle of the adhesive tube.
   b. Reduce the diameter of the plunger disc so that the disc will enter the large end of the adhesive tube.
5. Commercial type razor knife (for cutting along the edge of the glass).

Windshield installation requires a number of timed steps because of the cure times involved with the primers, solvents, and adhesives used in this procedure. This timing is important and must be followed.

Install or Connect (Figures 3 and 4)
Tools Required:
J-24811 Adhesive Dispensing Gun
J-2189-02 Weatherstrip Tool
1. Pinchweld primer.
   • Primer must be thoroughly stirred and agitated.
   • Allow to cure for 30 minutes.
2. Rubber cleaner to both channels of rubber weatherstrip.
   • Wait 5 minutes before wiping the channels with a clean dry cloth.
3. Rubber primer to both channels of the weatherstrip.
   • Wait 30 minutes for curing.
4. Inner surface of glass with a clean alcohol dampened cloth. Allow the glass to air dry.
4. Blackout primer to the inside face of the glass.
   • Start 10 mm (.40-inch) from the edge and work the primer outward to the edge.
   • Allow the primer to dry.
5. Urethane adhesive bead with a diameter of 6 mm (.25-inch) to the center of the pinchweld flange around the entire windshield opening.
   • Glass must be installed within 20 minutes of performing this step.
   • Spray a mist of water to the urethane bead, wetting it fully.
6. Rubber weatherstrip to the pinchweld flange.
7. Urethane adhesive bead with a 4.5 mm (.18-inch) diameter to the rubber weatherstrip glass channel (figure 3).
8. Glass to the window opening.
9. Rubber lubricant to the lockstrip channel.
   • Glass must be seated before the lubricant is applied.

**STATIONARY GLASS REPLACEMENT**

**Remove or Disconnect (Figures 5 through 9)**

**CAUTION:** Always wear heavy gloves when handling glass to avoid the risk of injury.

1. Reveal molding.
   - Push the clip to one side to free the ends.

   *NOTICE:* Refer to "Notice" on page 10A3-1 of this section.

2. Window glass.
   - Insert a putty knife between the glass and the weatherstrip and run the knife around the entire edge of the window.

   *NOTICE:* Refer to "Notice" on page 10A3-1 of this section.

   - With a helper standing outside the vehicle, push the glass from the weatherstrip from inside the cab while the helper removes the glass.

**Install or Connect (Figures 5 through 9)**

**Tool Required:**

J-2189-02 Weatherstrip Tool
CAUTION: Always wear heavy gloves when handling glass to avoid risk of injury.

1. Sealing tape on the outside upper corners of the opening, 120 mm ('1/2-inch) wide.

2. Weatherstrip at the center of the bottom edge of the opening and work around the entire opening of the flange.
   - Brush the weatherstrip with soapy water.

3. Glass in place on the weatherstrip.
   - Insert the hook end of tool J-2189-02 between the weatherstrip and the edge of the glass.
   - Pull the tool around the glass to slip the edge of the glass into the groove of the weatherstrip.

4. Reveal molding.

Inspect
- Glass for cracks or chips on the edge. If the glass is chipped, it should be ground smooth.

17. Sliding Back Window Assembly

Figure 5—Back Window Components

Figure 6—Sliding Back Window Components
Thread the end of the molding through the handle of tool J-2189-02.

Push the end of the molding into the groove of the weatherstrip at the center of the bottom edge (figure 4).

Move the tool around the window while feeding the molding. Use a hitching motion to avoid stretching the molding.

Cut any excess molding leaving the ends to overlap by 25 mm (1-inch).

5. Retaining clip over one end of the molding.
   - Butt the ends of the molding together and secure them with the clip.

6. Ends of the molding, with the clip in place, into the groove of the weatherstrip.
When replacing a cracked windshield, it is important that the cause of the crack be determined and the condition corrected, before a new glass is installed. The cause of the crack may be an obstruction or high spot somewhere around the flange of the opening; cracking may not occur until pressure from the high spot or obstruction becomes particularly high due to winds, extremes of temperature, or rough terrain. Suggestions of what to look for are described later in this section under "Inspection".

If a crack extends to the edge of the glass, mark the point where the crack meets the weatherstrip. (Use a piece of chalk and mark the point on the cab, next to the weatherstrip.) Later, when examining the flange of the opening for a cause of the crack start at the point marked.

The higher the temperature of the work area, the more pliable the weatherstrip will be. The more pliable the weatherstrip, the more easily the windshield can be removed.

NOTICE: When cleaning windshield glass, avoid contacting the edge of the plastic laminate material (on the edge of the glass) with volatile cleaner. Contact may cause discoloration and deterioration of the plastic laminate by wicking action. Do not use a petroleum based solvent such as kerosene or gasoline. The presence of oil will prevent adhesion of new material.

Remove or Disconnect (Figures 10 and 11)

CAUTION: Always wear heavy gloves when handling glass to minimize the risk of injury.
weatherstrip should be removed from the flange of the opening and the flange inspected. Look for high weld or solder spots, hardened spot weld sealer, or any other obstruction or irregularity in the flange. Check the weatherstrip for irregularities or obstructions in it.

Check a windshield that is to be installed to make sure it does not have any chipped edges. Chipped edges can be ground off, restoring a smooth edge to the glass, and minimizing concentrations of pressure that cause breakage. Remove no more than necessary, in an effort to maintain the original shape of the glass and the proper clearance between it and the flange of the opening.

**SERVICE KIT (Figures 12 through 16)**

To replace a urethane adhered windshield, GM adhesive service kit No. 9636067 contains some of the materials needed, and must be used to insure the original integrity of the windshield design. Materials in the kit include:

1. One tube of adhesive material.
2. One dispensing nozzle.
3. Steel music wire.
4. Rubber cleaner.
5. Rubber primer.
6. Pinchweld primer.
7. Blackout primer.

8. Filler strip (for use on windshield installations for vehicles equipped with embedded windshield antenna).

Other materials are required for windshield installation which are not included in the service kit. These include:
1. GM Rubber lubricant No. 1051717.
2. Alcohol for cleaning the edge of the glass.
3. Adhesive dispensing gun J-24811 or an A standard household cartridge type gun reworked as follows:

**Figure 10—Windshield Components**

**Figure 11—Cutting the Glass from the Adhesive**

**Figure 12—Primer Applications Locations**
a. Widen the end slot to fit the diameter of the dispensing nozzle of the adhesive tube.
b. Reduce the diameter of the plunger disc so that the disc will enter the large end of the adhesive tube.

5. Commercial type razor knife (for cutting along the edge of the glass).

Windshield installation requires a number of timed steps because of the cure times involved with the primers, solvents, and adhesives used in this procedure. This timing is important and must be followed.

SHORT METHOD

Clean

1. Loose material from the glass frame opening.
2. Edge of the glass with alcohol or equivalent.

Install or Connect (Figures 12 through 16)

1. Support molding onto the pinchweld flange from inside the vehicle.
   • Locate the joint of the molding at the bottom center of the molding.
2. Clear glass primer to the inner edge of the windshield from the edge of the glass inward 10 mm (.40-inch), and around the entire perimeter of the glass.
   • Allow 30 minutes to cure.
3. Blackout primer to the glass in the same area as the clear primer.
   • Allow to dry to the touch.
4. Windshield.
   • Place two rubber blocks onto the base of the pinchweld flange. Place the blocks in line with the last screw on either side of the cowl grille cover.
   • With the aid of a helper, left the glass into the opening. Center the glass in the opening, on top of the support molding.
   • Check the fit of the reveal molding. If necessary, remove the glass and cut away additional urethane to give the proper windshield height. Place the glass in the window opening.
• Cut the tip of the adhesive cartridge approximately 5 mm (\(\frac{5}{16}\)-inch) from the end of the tip.

• Apply the adhesive first in and around the spacer blocks. Apply a smooth continuous bead of adhesive into the gap between the glass edge and the sheet metal. Use a flat-bladed tool to paddle the material into position if necessary. Be sure that the adhesive contacts the entire edge of the glass, and extends to fill the gap between the glass and the primed sheet metal (extended method) or solidified urethane base (short method).

• Spray a mist of water onto the urethane. Water will assist in the curing process. Dry the area where the reveal molding will contact the body or glass.

5. New reveal moldings.

• Remove the protective tape covering the butyl adhesive on the underside of the molding.

• Push the molding caps onto each end of one of the reveal moldings.

• Press the lip of the molding into the urethane adhesive while holding it against the edge of the windshield. Take care to seat the molding in the corners. The lip must fully contact the adhesive and the gap must be entirely covered by the crown of the molding.

• Slide the molding caps onto the adjacent moldings.

• Use tape to hold the molding in position until the adhesive cures.

6. Wiper arms.

7. Interior garnish moldings.

• Allow the vehicle to sit for six hours before driving.
EXTENDED METHOD

Clean
- The old adhesive from the pinchweld flange using a sharp scraper or chisel.

Install or Connect (Figure 12)
- Pinchweld primer to the pinchweld area.
  - Do not allow primer to touch exposed paint.
  - Allow 30 minutes to dry.
- Follow the steps as listed under “Short Method” in this section for the rest of this procedure.

STATIONARY GLASS REPLACEMENT

Remove or Disconnect (Figures 17, 18 and 19)

CAUTION: Always wear heavy gloves when handling glass to avoid the risk of injury.

1. Rivets (if equipped) using a 5 mm (3/16-inch) drill bit.

NOTICE: Refer to “Notice” on page 10A3-1 of this section.

2. Window glass and weatherstrip.
  - Run a putty knife around the edge of the window, between the weatherstrip and the cab panels (inside and outside the cab).
Have a helper stand outside the cab next to the window.
Use a putty knife, or other blunt tool, to force the edge of the weatherstrip off the flange of the opening inside the cab, while pushing out on the glass.
Continue around the window, forcing the weatherstrip off the flange, until the glass and weatherstrip are free of the opening.
Have the helper remove the glass and weatherstrip from the outside of the vehicle.

Inspect
- Flange.
- Weatherstrip.
- New glass.

Install or Connect (Figures 17, 18 and 19)
- To ease installation, the weatherstrip can be heated with a non-flame source. Do not heat above 52°C (125°F), or for more than 1 1/2 hours.

1. Weatherstrip around the edge of the replacement glass.
   - Place a length of cord about 6 mm (1/4-inch) thick in the groove of the weatherstrip where the flange of the opening will fit.
   - Overlap the ends of the cord about 152 mm (6 inches) and locate at the bottom of the window.
   - Brush a soapy solution of water around the outside edge of the cab opening.

2. Glass and weatherstrip to flange.
   - Have a helper hold the glass and weatherstrip (with the cord around it) up to the window opening from the outside of the cab; with the ends of the cord placed through the opening and hang loosely inside the cab.
   - While the helper holds the glass firmly in place, pull one end of the cord, forcing the lip of the weatherstrip up and over the flange.

3. Rivets (if equipped) to the weatherstrip and the side panel with a rivet installing gun.

ALL MODELS

GLASS POLISHING
MINOR SCRATCH AND ABRASION REMOVAL
Minor scratches and abrasions can be removed or reduced by following the procedure outlined below. Precautions must be taken, however, to prevent distortions of vision; double vision may result if an attempt is made to remove deep scratches. Deep scratches should not be removed from an area in the driver's line of vision; in such cases, the glass should be replaced.

The procedure that follows was developed using a cerium oxide compound. Follow manufacturer's directions if other materials are used.

Recommended Equipment
1. A low speed (600-1300 rpm) rotary polisher.
2. A wool, felt, rotary polishing pad 76 mm (three-inches) in diameter and 51 mm (two-inches) thick.
3. Powdered cerium oxide mixed with water. This is the abrasive compound.
4. A wide mouth container to hold the abrasive compound.

Polishing Procedure (Figure 20)
1. Mix at least 44 ml (1.5 oz.) of cerium oxide with enough water to obtain a creamy consistency. (If the mixture is too thick it will cake on the felt pad more quickly. If it is too runny, more polishing time will be needed.)
2. Draw a circle around the scratches on the opposite side of the glass with a marking crayon, or equivalent.
3. Draw a line directly behind the scratch(es) to serve as a guide for locating the scratch while polishing.
4. Cover the surrounding area with masking paper to catch the drippings or spattered polish.
5. Dip the felt pad attached to the polisher into the mixture. Do not submerge the pad or allow the pad to stay in the mixture as it may loosen the bond between the pad and the metal plate.

**NOTICE:** Never hold the tool in one spot or operate the tool on the glass any longer than 30 to 45 seconds. If the glass becomes hot to touch, let it air cool before proceeding further. Cooling with cold water may crack heated glass. Avoid excessive pressure. It may cause overheating of the glass.

6. Polish the scratched area, but note the following:
   a. Agitate the mixture as often as needed to maintain the creamy consistency of the compound.
   b. Use moderate but steady pressure.
   c. Hold the pad flat against the glass.
   d. Use a feathering-out motion.
   e. Dip the pad into the mixture every 15 seconds to ensure that the wheel and the glass are always wet during the polishing operation. (A dry pad causes excessive heat to develop.)
   f. Keep the pad free of dirt and other foreign substances.

7. After removing the scratch, wipe the area clean of any polish.
8. Clean the polishing pad.

7. Side door scuff plate (116).
8. Side door mat (if equipped) (118).
9. Carpet to side door screws (119).
10. Rear door scuff plate (121).
11. Front trim panel (123).
12. Rear trim panel (125).
13. Rear corner panel (127).

Install or Connect (Figures 32 through 41)
1. Rear carpet to the vehicle.
2. Rear corner panel (127).
3. Rear trim panel (125).
4. Front trim panel (123).
5. Rear door scuff plate (121).
6. Carpet to side door screws (119).
7. Side door mat (if equipped) (118).
8. Side door scuff plate (116).
9. Front carpet (115) to the vehicle.
10. Carpet to the dash retainers (108).
   - Bend the retainers over the carpet.
11. Front step panel mat (if equipped) (114).
12. Front door scuff plate (112).
13. Front carpet retainer (110).
14. Seats. Refer to SEATS (SEC. 10A2).

**HEADLINER REPLACEMENT**

Remove or Disconnect (Figure 42)
1. Upper window trim that supports the headliner. Refer to "Interior Trim Replacement."
2. Headliner retainer bow (if equipped).
   - Pull the bow (128) from the retainer.
3. Retainer bolts (129) and the retainers (130).
4. Headliner (131) from the vehicle.
   - Shift the headliner from side to side to disengage the headliner from the clips.

Install or Connect (Figure 42)
1. Headliner (131) to the vehicle.
   - Place the headliner into the roof clips.
2. Retainers (130) to the headliner, and the retainer bolts (129).
3. Headliner retainer bow (if equipped).
- Push the bow (128) onto the retainer.

4. Upper window trim that supports the headliner. Refer to "Interior Trim Replacement."

**INTERIOR TRIM REPLACEMENT**

- **Remove or Disconnect**

1. Lock pillar garnish molding screws and the lock pillar garnish molding (figure 43).
2. Front door hinge pillar molding screws and the front door hinge pillar molding (figure 44).
3. Sunshade screws and the sunshade (figure 45).
4. Front header garnish molding screws and the front header garnish molding (figure 46).
5. Roof side rail garnish molding (figure 47). For vehicles with intermediate doors only.
6. Roof side header garnish molding (figure 48). For vehicles with the sliding side door only.
7. Lower lock pillar garnish molding screws and the molding (figure 49).
8. Body side front garnish molding screws and the molding (figure 49).
9. Roof rear header garnish molding screws and the molding (figure 50).
10. Body rear corner garnish molding screws and the molding (figure 51).
11. Body side rear garnish molding screws and the molding (figure 52).
12. Body side front trim panel screws and the trim panel (figure 39).
   - Pull the panel from the retainers.
13. Body side rear trim panel screws and the trim panel (figure 40).
   - Pull the panel from the retainers.
14. Body side trim rear corner panel screws and the panel (figure 41).
   - Pull the panel from the retainers.

- **Install or Connect**

1. Body side trim rear panel and screws (figure 41).
2. Body side rear trim panel and screws (figure 40).
3. Body side front trim panel and screws (figure 39).
4. Body side rear garnish molding and screws (figure 52).
5. Body rear corner garnish molding and screws (figure 51).
6. Roof rear head garnish molding and screws (figure 50).
7. Body side front garnish molding and screws (figure 49).
8. Lower lock pillar garnish molding and screws (figure 49).
9. Roof side header garnish molding and screws (figure 48). For vehicles with the sliding side door only.
10. Roof side rail garnish molding and screws (figure 47). For vehicles with intermediate doors only.
11. Front header garnish molding and screws (figure 46).
12. Sunshade and screws (figure 45).
13. Front door hinge pillar molding and screws (figure 44).
14. Lock pillar garnish molding and screws (figure 43).
ENGINE COVER REPLACEMENT

Remove or Disconnect (Figures 53 and 54)
1. Instrument panel lower extension screws (150), washers (151), and shims (152).
2. Instrument panel lower extension (153).
3. Engine cover (158) to floor panel bolts (156).
4. Clamp (157) from the pin (155).
5. Engine cover (158) from the vehicle.

Install or Connect (Figures 53 and 54)
1. Engine cover (158) to the vehicle.
2. Clamp (157) to the pin (155).
3. Engine cover (158) to floor panel bolts (156).
4. Instrument panel lower extension (153).
5. Instrument panel lower extension screws (150), washers (151) and shims (152).

END GATE REPLACEMENT

**FENDER SIDE MODELS**

**Remove or Disconnect (Figure 1)**

- Open the end gate and support it with a table or other suitable support.
- Fender to end gate bolt (6) and washer (7).
- End gate (4), and bushing (5) from the vehicle.
- Chain (3) to fender nut (1), washer (2), and eye bolt.

**Install or Connect (Figure 1)**

1. Chain (3) with eye bolt to the fender.
2. Washer (2) and nut (1) to the eye bolt.
3. End gate (4) and bushing (5) to the vehicle.
4. Fender to end gate washer (7), and bolt (6).
   - Anti-rattle bumper must seat fully against vertical surface of tab (159).

**FLEET SIDE MODELS**

**Remove or Disconnect (Figure 2)**

- Open the end gate and support it with a table or other suitable support.
- Link and striker plate (8) to fender bolts (17).
- Link and striker (8) from the end gate.
  - Rotate the link until it aligns with the tab (9) on the end gate, and pull it from the end gate.
- Hinge (14) to end gate bolts (13).
- End gate (12) from the vehicle.
- Inner hinge half (A).
- Hinge (14) to fender bolts (16).
- Outer hinge half (B).
- Bumper (10) to fender screws (11).
- Bumpers (10) from the vehicle.

**Install or Connect (Figure 2)**

1. Bumpers (10) to the vehicle.
2. Bumper (10) to fastener screws (11).
3. Outer hinge half (B).
4. Hinge (14) to fender bolts (16).
5. Inner hinge half (A).
6. End gate (12) to the vehicle.
7. Hinge (14) to end gate bolts (13).
8. Link and striker (8) to the end gate.
   - Place the slot on the link in line with the tab (9) on the end gate, and place the link onto the end gate. Pivot the link into its proper position.
9. Link and striker to the fender.
10. Link and striker to fender bolts (17).

**HANDLE AND LATCH REPLACEMENT**

**Remove or Disconnect (Figure 3)**

- Lower and support the end gate with a table or other suitable support.
- Latch rods (19) from the clips (20).
- End gate to handle bolts (22).
- Handle (21) from the end gate.
- Link from the end gate.
  - Refer to “End Gate Replacement.”
- Latch (18) to end gate bolts (23).
- Latch (18) from the vehicle.

**Install or Connect (Figure 3)**

1. Latch (18) to the vehicle.
2. Latch (18) to end gate bolts (23).
3. Link to the end gate.
   - Refer to "End Gate Replacement."
4. Handle (21) to the end gate.
5. End gate to handle bolts (22).
6. Latch rods (19) to the clips (20).
**UTILITY VEHICLE MODELS**

**END GATE REPLACEMENT**

Remove or Disconnect (Figures 4, 5, and 6)

- The end gate must be in the closed position.
- Torque rod to frame stud (30) and nut (32).
  - Allow the torque rod to swing down.
- Open the end gate, and support it with a table or other suitable support.
- Electrical wiring harness (if equipped). Refer to "End Gate Cover Replacement" for access to the harness.
- Cable (34) to end gate opening bolts (37), spacers (36), and washers (35).
4. Torque rod bracket bolts (24) and brackets (25).
5. Hinge (49) to floor panel bolts (48) from the under side of the vehicle.
6. End gate from the vehicle.
   - Lift the end gate from the body.
   - Guide the torque rods over the gravel deflectors to prevent damage.

**Install or Connect (Figures 4, 5, and 6)**

1. End gate to the vehicle.
   - Guide the torque rods over the gravel deflectors to prevent damage.
   - Insert the hinges into the floor panel slots.
2. Hinge (49) to floor pan bolts (48) to the under side of the vehicle.
3. Torque rod brackets (25) and bolts (24).
4. Cable (34) to the end gate opening with bolts (37), spacers (36), and washers (35).
5. Electrical wiring harness (if equipped). Refer to "End Gate Cover Replacement" for access to the harness.
   - Close the end gate.
6. Torque rod to frame stud (30) and nut (32).
7. Torque rods onto the studs.

**TORQUE ROD REPLACEMENT**

**Remove or Disconnect (Figure 4)**

1. End gate. Refer to "End Gate Replacement."
2. End gate cover.
3. End gate to torque rod inner bracket bolts (27).
4. Torque rod (26) with silencers (28) from the end gate.
10A5-6 END GATE

**Install or Connect (Figure 4)**
1. Torque rod (26) with silencers (28) to the end gate.
2. Inner bracket (29) to the torque rod.
3. End gate to torque rod inner bracket bolts (27).
4. End gate cover.
5. End gate. Refer to "End Gate Replacement."

**HINGE REPLACEMENT**

**Remove or Disconnect (Figure 6)**
- Lower the end gate.
  1. Hinge to body bolts (48) for the hinge to be removed only.
  - Loosen the hinge to body bolts (48) on the opposite hinge.
  2. Hinge to end gate bolts (47) for the hinge to be removed.
  - Pull the end gate away from the body several inches and remove the hinge from the body.
  - Lift the end gate slightly to allow removal of the hinge from the end gate.

**Install or Connect (Figure 6)**
- Lift the end gate slightly and install the hinge to the end gate.
- Pull the end gate away from the body several inches, and insert the hinge into the body.
  1. Hinge to end gate bolts (47).
  2. Hinge to body bolts (48).
  - Tighten the hinge to body bolts on the opposite hinge.

**END GATE COVER REPLACEMENT**

**Remove or Disconnect (Figure 7)**
1. End gate cover screws (51).
2. End gate cover (50).

**Install or Connect (Figure 7)**
1. End gate cover (50).
2. End gate cover screws (51).

**HANDLE AND CONTROL ASSEMBLY REPLACEMENT**

**Remove or Disconnect (Figure 8)**
1. End gate cover.
2. Control rod (64) from the handle (61).
3. Handle to end gate screws (62).
4. Handle (61) from the end gate.
5. Right and left latch rods (65) from the control assembly.
6. Control assembly to end gate bolts (60).
7. Control assembly (55) from the end gate.
8. Window lockout rod spring (54).
9. Lockout rod (53) to end gate bolts (52).
10. Lockout rod (53) from the end gate.

**Install or Connect (Figure 8)**
1. Lockout rod (53) to the end gate.
   - The bottom of the rod must fit into the clip at the base of the end gate.
2. Lockout rod (53) to end gate bolts (52).
3. Window lockout rod spring (54).
4. Control assembly (55) to the end gate.
5. Control assembly to end gate bolts (60).
6. Right and left latch rods (65) from the control assembly.
7. Handle (61) to the end gate.
8. Handle to end gate screws (62).
9. Control rod (64) to the handle (61).
10. End gate cover.
**LATCH REPLACEMENT**

++ Remove or Disconnect (Figure 9)

1. End gate cover.

2. Right or left latch rod (65) from the control assembly.

3. Latch (66) to end gate screws (67).

4. Latch (66) from the end gate.

++ Install or Connect (Figure 9)

1. Latch (66) with rod to the end gate.

2. Latch (66) to end gate screws (67).

3. Right or left latch rod (65) to the control assembly.

4. End gate cover.
REGULATOR REPLACEMENT

MANUAL REGULATOR

Remove or Disconnect (Figure 10)
1. End gate cover.
2. Control assembly. Refer to "Handle And Control Assembly Replacement."
3. Sash assembly (73). Refer to "Sash Assembly Replacement."
4. Regulator (69) to end gate bolts (70).
5. Regulator (69) from the end gate.

Install or Connect (Figure 10)
1. Regulator (69) to the end gate.
2. Regulator (69) to end gate bolts (70).
3. Sash assembly (73). Refer to "Sash Assembly Replacement."
4. Control assembly. Refer to "Handle And Control Assembly Replacement."
5. End gate cover.

POWER REGULATOR

Remove or Disconnect (Figures 10 and 11)
1. End gate cover.
2. Control assembly. Refer to "Handle And Control Assembly Replacement."
3. Sash assembly (73). Refer to "Sash Assembly Replacement."

Install or Connect (Figures 10 and 11)
1. Gear box (80) to the regulator (76).
2. Gear box (80) to regulator bolts.
3. Regulator (76) to the end gate.
4. Regulator (76) to end gate bolts (78).
5. Drive cable (77) to the regulator (76).
6. Sash assembly (73). Refer to "Sash Assembly Replacement."
7. Control assembly. Refer to "Handle and Control Assembly Replacement."
8. End gate cover.

CAUTION: Step 4 must be performed if the gear box is removed or disengaged from the regulator lift arms. The left arms are under tension from the counterbalance spring, and can cause injury if the gear box is removed without locking the sector gears in place.

4. Drill a 3.1 mm (\(\frac{1}{8}\)-inch) diameter hole through the sector gear and back plate. Install a sheet metal tapping screw into the hole to lock the sector gears in position.
5. Drive cable (77) at regulator (76).
6. Regulator (76) to end gate bolts (78).
7. Regulator (76) from the end gate.
8. Gear assembly (80) to regulator bolts.
9. Gear assembly (80) from the regulator (76).

CAUTION: Step 4 must be performed if the gear box is removed or disengaged from the regulator lift arms. The left arms are under tension from the counterbalance spring, and can cause injury if the gear box is removed without locking the sector gears in place.

4. Drill a 3.1 mm (\(\frac{1}{8}\)-inch) diameter hole through the sector gear and back plate. Install a sheet metal tapping screw into the hole to lock the sector gears in position.
5. Drive cable (77) at regulator (76).
6. Regulator (76) to end gate bolts (78).
7. Regulator (76) from the end gate.
8. Gear assembly (80) to regulator bolts.
9. Gear assembly (80) from the regulator (76).

CAUTION: Step 4 must be performed if the gear box is removed or disengaged from the regulator lift arms. The left arms are under tension from the counterbalance spring, and can cause injury if the gear box is removed without locking the sector gears in place.

4. Drill a 3.1 mm (\(\frac{1}{8}\)-inch) diameter hole through the sector gear and back plate. Install a sheet metal tapping screw into the hole to lock the sector gears in position.
5. Drive cable (77) at regulator (76).
6. Regulator (76) to end gate bolts (78).
7. Regulator (76) from the end gate.
8. Gear assembly (80) to regulator bolts.
9. Gear assembly (80) from the regulator (76).

WINDOW MOTOR AND BLOCKOUT SWITCH REPLACEMENT

Remove or Disconnect (Figure 12)
1. End gate panel.
2. Wiring harness from the motor and switch.
3. Cable from the motor.
4. End gate to motor bolts (103).
5. Motor (104) from the end gate.
6. Latch containing the blockout switch from the end gate. Refer to “Latch Replacement.”
7. Blockout switch (106) to latch bolts (105).
8. Blockout switch (106) from the latch.

Install or Connect (Figure 12)
1. Blockout switch (106) to the latch.
2. Blockout switch (106) to latch bolts (105).
3. Latch to the end gate. Refer to “Latch Replacement.”
4. Motor (104) to the end gate.
5. End gate to motor bolts (103).
6. Cable to the motor.
7. Wiring harness to the motor and the switch.
8. End gate panel.
SASH ASSEMBLY REPLACEMENT

**Remove or Disconnect (Figure 10)**

1. Window run channel caps (figure 13).
2. Inner and outer window glass seals. Refer to "Window Glass Seal Replacement."
3. End gate cover.
   - Regulate the window so that the sash channel bolts (72) are accessible.
4. Sash (73) to sash channel bolts (72).
5. Sash (73) with glass (75) from the end gate.
6. Sash rails (71) from the regulator (69).

**Install or Connect (Figure 10)**

1. Sash rails (71) to the regulator (69).
2. Sash (73) with glass (75) to the end gate.
3. Sash (73) to sash channel bolts (72).
4. End gate cover.
5. Inner and outer window glass seals. Refer to "Window Glass Seal Replacement."

6. Window run channel caps (figure 13).

**RUN CHANNEL REPLACEMENT**

**Remove or Disconnect (Figure 13)**
1. Window run-channel caps (83).
   - Completely lower the window.
2. Run-channel (81) from the end gate.
   - Pull the channel from the end gate. Twist the channel to clear the window opening.

**Install or Connect (Figure 13)**
1. Run-channel (81) to the end gate.
   - Twist the channel into the window opening.
2. Run-channel (81) to end gate bolts (82).
3. Window run-channel caps (83).

**END GATE OUTSIDE CRANK REPLACEMENT**

**Remove or Disconnect (Figure 14)**
1. Handle and control assembly. Refer to "Handle And Control Assembly Replacement."
2. Crank to end gate nuts (85).
3. Crank (88) and bezel (86) from the end gate.

**Install or Connect (Figure 14)**
1. Crank (88) and bezel (86) to the end gate.
2. Crank to end gate nuts (85).
3. Handle and control assembly. Refer to "Handle And Control Assembly Replacement."

**WINDOW GLASS SEAL REPLACEMENT**

**Remove or Disconnect (Figure 15)**
- Lower the window.
- Inner or outer seal by prying the clips from the end gate.

**Install or Connect (Figure 15)**
- Inner or outer seal by pressing the clips into the holes in the end gate.

**WEATHERSTRIP REPLACEMENT**

**Remove or Disconnect (Figure 16)**
- Weatherstrip from the end gate using 3M Release Agent (or equivalent).

**Install or Connect (Figure 16)**
- Weatherstrip to the end gate using 3M Weatherstrip Adhesive (or equivalent).
UTILITY VEHICLE REMOVABLE TOP

5. Side trim panel rear attaching screws.
   • Remove twelve screws on the left side.
   • Remove eleven screws on the right side.
   • Pull the panel away only far enough to gain access to the hidden top bolt.
6. Hidden bolts (115).
7. The removable top (111).
   • With the assistance of helpers, carefully lift the top from the vehicle. Do not allow the sides to bend.

Install or Connect (Figures 17 and 18)
To prevent damage to the top and to ensure proper weatherstrip sealing, the following procedure must be followed.
   • Remove the upper spare tire brace.
1. The top onto the vehicle.
   • Use the two rear guide pins as locators.
2. Top to roof mounting bolts (114).
3. Top to side panel mounting bolts (112).
   • Start with the bolts nearest the end gate, and work towards the cab.
   • Do not install the second bolt from the rear on the right side at this time.
   • Do not install the bolts (113) nearest the cab.
4. Upper tire brace bolt and the upper brace.
   • Reinstall the brace after the top is removed.
5. Side trim panel rear attaching screws.
   • Remove twelve screws on the left side.
   • Remove eleven screws on the right side.
   • Pull the panel away only far enough to gain access to the hidden top bolt.
6. Hidden bolts (115).
7. The removable top (111).
   • With the assistance of helpers, carefully lift the top from the vehicle. Do not allow the sides to bend.

Install or Connect (Figures 17 and 18)
To prevent damage to the top and to ensure proper weatherstrip sealing, the following procedure must be followed.
   • Remove the upper spare tire brace.
1. The top onto the vehicle.
   • Use the two rear guide pins as locators.
2. Top to roof mounting bolts (114).
3. Top to side panel mounting bolts (112).
   • Start with the bolts nearest the end gate, and work towards the cab.
   • Do not install the second bolt from the rear on the right side at this time.
   • Do not install the bolts (113) nearest the cab.
4. Upper tire brace bolt and the upper brace.
   • Reinstall the brace after the top is removed.
5. Side trim panel rear attaching screws.
   • Remove twelve screws on the left side.
   • Remove eleven screws on the right side.
   • Pull the panel away only far enough to gain access to the hidden top bolt.
6. Hidden bolts (115).
7. The removable top (111).
   • With the assistance of helpers, carefully lift the top from the vehicle. Do not allow the sides to bend.

Install or Connect (Figures 17 and 18)
To prevent damage to the top and to ensure proper weatherstrip sealing, the following procedure must be followed.
   • Remove the upper spare tire brace.
1. The top onto the vehicle.
   • Use the two rear guide pins as locators.
2. Top to roof mounting bolts (114).
3. Top to side panel mounting bolts (112).
   • Start with the bolts nearest the end gate, and work towards the cab.
   • Do not install the second bolt from the rear on the right side at this time.
   • Do not install the bolts (113) nearest the cab.
4. Upper tire brace bolt and the upper brace.
   • Reinstall the brace after the top is removed.
5. Side trim panel rear attaching screws.
   • Remove twelve screws on the left side.
   • Remove eleven screws on the right side.
   • Pull the panel away only far enough to gain access to the hidden top bolt.
6. Hidden bolts (115).
7. The removable top (111).
   • With the assistance of helpers, carefully lift the top from the vehicle. Do not allow the sides to bend.

Install or Connect (Figures 17 and 18)
To prevent damage to the top and to ensure proper weatherstrip sealing, the following procedure must be followed.
   • Remove the upper spare tire brace.
1. The top onto the vehicle.
   • Use the two rear guide pins as locators.
2. Top to roof mounting bolts (114).
3. Top to side panel mounting bolts (112).
   • Start with the bolts nearest the end gate, and work towards the cab.
   • Do not install the second bolt from the rear on the right side at this time.
   • Do not install the bolts (113) nearest the cab.
4. Upper tire brace bolt and the upper brace.
   • Reinstall the brace after the top is removed.
5. Side trim panel rear attaching screws.
   • Remove twelve screws on the left side.
   • Remove eleven screws on the right side.
   • Pull the panel away only far enough to gain access to the hidden top bolt.
6. Hidden bolts (115).
7. The removable top (111).
   • With the assistance of helpers, carefully lift the top from the vehicle. Do not allow the sides to bend.

Install or Connect (Figures 17 and 18)
To prevent damage to the top and to ensure proper weatherstrip sealing, the following procedure must be followed.
   • Remove the upper spare tire brace.
1. The top onto the vehicle.
   • Use the two rear guide pins as locators.
2. Top to roof mounting bolts (114).
3. Top to side panel mounting bolts (112).
   • Start with the bolts nearest the end gate, and work towards the cab.
   • Do not install the second bolt from the rear on the right side at this time.
   • Do not install the bolts (113) nearest the cab.
4. Upper tire brace bolt and the upper brace.
   • Reinstall the brace after the top is removed.
5. Side trim panel rear attaching screws.
   • Remove twelve screws on the left side.
   • Remove eleven screws on the right side.
END GATE REPLACEMENT

Remove or Disconnect (Figures 19, 20, and 21)

- Lower the end gate.
  1. Torque rod bracket (119).
  2. Wiring harness (if equipped). Refer to "End Gate Trim And Cover Panel Replacement" for access to the wiring harness.
  3. Hinge access cover (131) and seal (132).
  4. End gate to hinge bolts (133).
- Lift the end gate to the almost closed position.
  5. Support cable (136) to end gate bolt (142) and washer (143).
  6. End gate with torque rod from the vehicle.

Install or Connect (Figures 19, 20 and 21)

1. End gate with torque rod (117) to the vehicle.
2. Support cable (136) to end gate washer (143) and bolt (142).
3. End gate to hinge bolts (133).
4. Hinge cover seal (132) and access cover (131).
5. Wiring harness (if equipped). Refer to "End Gate Trim And Cover Panel Replacement" for access to the wiring harness.
6. Torque rod bracket (119).

TORQUE ROD REPLACEMENT

Remove or Disconnect (Figure 19)

1. End gate. Refer to "End Gate Replacement."
2. Trim panel (if equipped) and the cover panel.
3. End gate to torque rod inner bracket bolts (126).
4. End gate to torque rod outer bracket bolts (122).
5. Inner (118) and outer (119) brackets from the end gate.
6. Torque rod (117) from the end gate.

Install or Connect (Figure 19)

1. Torque rod (117) to the end gate.
2. Outer brackets (117) to the end gate.
3. Outer bracket bolts (122).
4. Inner bracket (118) to the end gate.
5. Inner bracket bolts (126).
6. The cover panel and trim panel (if equipped).
7. End gate. Refer to "End Gate Replacement."

HINGE REPLACEMENT

Remove or Disconnect (Figure 20)

- Lower the end gate.
  1. Hinge to body bolts (134) for the hinge to be removed.
- Loosen the hinge to body bolts (134) on the opposite hinge.

2. Hinge cover screws (130) and covers (131).
3. Hinge to end gate bolts (133) for the hinge to be removed.
   - Pull the end gate away from the body several inches and remove the hinge from the body.
   - Lift the end gate slightly to allow removal of the hinge from the end gate.

Install or Connect (Figure 20)

- Lift the end gate slightly and install the hinge to the end gate.
- Pull the end gate away from the body several inches, and insert the hinge into the body.
1. Hinge to end gate bolts (133).
2. Hinge to body bolts (134).
   - Tighten the hinge to body bolts on the opposite hinge.
3. Hinge covers (131) and cover screws (130).

Figure 22—Trim Panel Components
**END GATE TRIM AND COVER PANEL REPLACEMENT**

*Remove or Disconnect (Figures 22 and 23)*
1. Trim panel screws (145).
2. Trim panel (144).
   - Slide the panel away from the glass opening.
   - Note the position of the cover panel screws. Five of the holes in the cover panel are also holes for the trim panel.
3. Cover panel screws (146).
4. Cover panel (147).

*Install or Connect (Figures 22 and 23)*
1. Cover panel (147).
2. Cover panel screws (146).
3. Trim panel (144).
4. Trim panel screws (145).

**HANDLE AND CONTROL ASSEMBLY REPLACEMENT**

*Remove or Disconnect (Figures 23 and 24)*
1. Trim panel (if equipped) and the cover panel.
2. Control rod (154) from the handle (159).
3. Handle to end gate screws (161).
4. Handle (159) from the end gate.
5. Right and left latch rods (150) from the control assembly.
6. Control assembly to end gate bolts (148).
7. Control assembly (149) from the end gate.

*Install or Connect (Figures 23 and 24)*
1. Control assembly (149) to the end gate.
2. Control assembly to end gate bolts (148).
3. Right and left latch rods (150) from the control assembly.
4. Handle (159) to the end gate.
5. Handle to end gate screws (161).
6. Control rod (154) to the handle (159).
7. End gate cover and trim panel (if equipped).

**LATCH REPLACEMENT**

*Remove or Disconnect (Figure 24)*
1. Trim panel (if equipped) and the cover panel.
2. Right or left latch rods (150) from the control assembly.
3. Latch (153) to end gate screws (152).
4. Latch (153) from the end gate.
Figure 24—Handle and Latch Components

Install or Connect (Figure 24)
1. Latch (153) with rod to the end gate.
2. Latch (153) to end gate screws (152).
3. Right or left latch rod (150) to the control assembly.
4. Cover panel and trim panel (if equipped).

REGULATOR REPLACEMENT

MANUAL REGULATOR

Remove or Disconnect (Figure 10)
1. Trim panel (if equipped) and cover panel.
2. Control assembly. Refer to "Handle And Control Assembly Replacement."
3. Sash assembly (73). Refer to "Sash Assembly Replacement."
4. Regulator (69) to end gate bolts (70).
5. Regulator (69) from the end gate.

Install or Connect (Figure 10)
1. Regulator (69) to the end gate.
2. Regulator (69) to end gate bolts (70).
3. Sash assembly (73). Refer to "Sash Assembly Replacement."
4. Control assembly. Refer to "Handle And Control Assembly Replacement."
5. End gate cover and trim panel (if equipped).

POWER REGULATOR

Remove or Disconnect (Figures 10 and 11)
1. Trim panel (if equipped) and end gate cover.
2. Control assembly. Refer to "Handle And Control Assembly Replacement."
3. Sash assembly (73). Refer to "Sash Assembly Replacement."
4. Wiring harness from the motor.
5. Regulator (76) to end gate bolts (78).
6. Regulator (76) from the end gate.

CAUTION: Step 7 must be performed if the gear box is removed or disengaged from the regulator lift arms. The lift arms are under tension from the counterbalance spring, and can cause injury if the gear box is removed without locking the sector gear in place.

7. Drill a 3.1 mm (3/6-inch) diameter hole through the sector gear and back plate. Install a sheet metal tapping screw into the hole to lock the sector gears in position.
8. Motor to regulator bolts.
9. Motor from the regulator.

Install or Connect (Figures 10 and 11)
1. Motor to the regulator.
2. Motor to regulator bolts.
3. Regulator (76) to the end gate.
4. Regulator (76) to end gate bolts (78).
5. Wiring harness to the motor.
6. Sash assembly (73). Refer to "Sash Assembly Replacement."
7. Control assembly. Refer to "Handle And Control Assembly Replacement."
8. Trim panel (if equipped) and end gate cover.
**BLOCKOUT SWITCH REPLACEMENT**

**Remove or Disconnect**
1. Trim panel (if equipped) and the end gate cover.
2. The right latch assembly. Refer to "Latch Replacement."
3. Wiring harness from the switch.
4. Switch from the latch.

**Install or Connect**
1. Switch to the latch.
2. Wiring harness to the switch.
3. The right latch assembly to the end gate. Refer to "Latch Replacement."
4. End gate cover and trim panel (if equipped).

**RUN CHANNEL REPLACEMENT**

**Remove or Disconnect (Figure 25)**
1. Completely lower the window.
2. Run-channel (156) to end gate bolts (155).
3. Run-channel (156) from the end gate.
   - Pull the channel from the end gate. Twist the channel to clear the window opening.

**Install or Connect (Figure 25)**
1. Run-channel (156) to the end gate.
   - Twist the channel into the window opening.
2. Run-channel (156) to end gate bolts (155).

**SASH ASSEMBLY REPLACEMENT**

**Remove or Disconnect (Figure 10)**
1. Inner and outer window glass seals. Refer to "Window Glass Seal Replacement."
2. Trim panel (if equipped) and cover panel.
   - Regulate the window so that the sash channel bolts (72) are accessible.
3. Sash (73) to sash channel bolts (72).
4. Sash (73) with glass (75) from the end gate.
5. Sash rails (71) from the regulator (69).

**Install or Connect (Figure 10)**
1. Sash rails (71) to the regulator (69).
2. Sash (73) with glass (75) to the end gate.
3. Sash (73) to sash channel bolts (72).
4. End gate cover and trim panel.
5. Inner and outer window glass seals. Refer to "Window Glass Seal Replacement."

**END GATE OUTSIDE CRANK REPLACEMENT**

**Remove or Disconnect (Figure 14)**
1. Handle and control assembly. Refer to "Handle And Control Assembly Replacement."
2. Crank to end gate nuts (85).
3. Crank (88) and gasket (87) from the end gate.

**Install or Connect (Figure 14)**
1. Crank (88) and gasket (87) to the end gate.
2. Crank to end gate nuts (85).
3. Handle and control assembly. Refer to "Handle And Control Assembly Replacement."
WINDOW GLASS SEAL REPLACEMENT

Remove or Disconnect (Figure 15)
- Lower the window.
  1. Trim panel (if equipped).
     - The inner seal is attached to the trim panel, when equipped, and replacement is not recommended.
  2. Inner or outer seals by prying the clips from the end gate.

Install or Connect (Figure 15)
  1. Inner or outer seal by pressing the clips into the holes in the end gate.
  2. Trim panel (if equipped).

WEATHERSTRIP REPLACEMENT

Remove or Disconnect (Figure 26)
  1. Weatherstrip screws (158).
  2. Weatherstrip from the end gate using 3M Release Agent (or equivalent).

Install or Connect (Figure 26)
  1. Weatherstrip to the end gate using 3M Weatherstrip Adhesive (or equivalent).
  2. Weatherstrip screws (158).
